1 [This lecture is mainly based on two earlier papers: 'Some Psychical Consequences of the Anatomical Distinction between the Sexes' (1925*j*), *RSE*, **19**, 249 ff., and 'Female Sexuality' (1931*b*), ibid., **21**, 215 ff. The last section, however, dealing with women in adult life, contains new material. Freud returned to the subject once again in Chapter VII of the posthumous *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**, 173–5.]

if I had been silent about them. As you see, when one starts making excuses it turns out in the end that it was all inevitable, all the work of destiny. I submit to it, and I beg you to do the same.

Today's lecture, too, should have no place in an introduction; but it may serve to give you an example of a detailed piece of analytic work, and I can say two things to recommend it. It brings forward nothing but observed facts, almost without any speculative additions, and it deals with a subject which has a claim on your interest second almost to no other. Throughout history people have knocked their heads against the riddle of the nature of femininity:

> Häupter in Hieroglyphenmützen,
> Häupter in Turban und schwarzem Barett,
> Perückenhäupter und tausend andre
> Arme, schwitzende Menschenhäupter. . . .[1]

Nor will *you* have escaped worrying over this problem – those of you who are men; to those of you who are women this will not apply – you are yourselves the problem. When you meet a human being, the first distinction you make is 'male or female?' and you are accustomed to make the distinction with unhesitating certainty. Anatomical science shares your certainty at one point and not much further. The male sexual product [*Geschlechtsprodukt*], the spermatozoon, and its vehicle are male; the ovum and the organ that harbours it are female. In both sexes organs have been formed which serve exclusively for the sexual functions [*Geschlechtsfunktionen*]; they were probably developed from the same [innate] disposition into two different forms. Besides this, in both sexes the other organs, the bodily shapes and tissues, show the influence of the individual's sex, but this is inconstant and its amount
[114] variable; these are what are known as the secondary sexual characters. Science next tells you something that runs counter to your expectations and is probably calculated to confuse your feelings. It draws your attention to the fact that portions of the male sexual apparatus also appear in women's bodies, though in an atrophied state, and *vice versa* in the alternative case. It regards their occurrence as indications of *bisexuality*,[2] as though an individual is not a man or a woman but always

1 [Heads in hieroglyphic bonnets,
Heads in turbans and black birettas,
Heads in wigs and thousand other
Wretched, sweating heads of humans. . . .
Heine, *Nordsee* (Second Cycle, VII, 'Fragen').]

2 [Bisexuality was discussed by Freud in the first edition of his *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, 7, 126–9. The passage includes a long footnote to which he made additions in later issues of the work. To this is appended an Editors' footnote which updates some of the anatomical science Freud refers to there and in the present text.]

both – merely a certain amount more the one than the other. You will then be asked to make yourself familiar with the idea that the proportion in which masculine and feminine are mixed in an individual is subject to quite considerable fluctuations. Since, however, apart from the very rarest cases, only one kind of sexual product – ova or semen – is nevertheless present in one person, you are bound to have doubts as to the decisive significance of those elements and must conclude that what constitutes masculinity or femininity is an unknown characteristic which anatomy cannot lay hold of.

Can psychology do so perhaps? We are accustomed to employ 'masculine' and 'feminine' as mental qualities as well, and have in the same way transferred the notion of bisexuality to mental life. Thus we speak of a person, whether male or female, as behaving in a masculine way in one connection and in a feminine way in another. But you will soon perceive that this is only giving way to anatomy or to convention. You cannot give the concepts of 'masculine' and 'feminine' *any* new connotation. The distinction is not a psychological one; when you say 'masculine', you usually mean 'active', and when you say 'feminine', you usually mean 'passive'. Now it is true that a relation of the kind exists. The male sex cell is actively mobile and searches out the female one, and the latter, the ovum, is immobile and waits passively. This behaviour of the elementary sexual organisms is indeed a model for the conduct of sexual individuals during intercourse. The male pursues the female for the purpose of sexual union, seizes hold of her and penetrates into her. But by this you have precisely reduced the characteristic of masculinity to [115]
the factor of aggressiveness so far as psychology is concerned. You may well doubt whether you have gained any real advantage from this when you reflect that in some classes of animals the females are the stronger and more aggressive and the male is active only in the single act of sexual union. This is so, for instance, with the spiders. Even the functions of rearing and caring for the young, which strike us as feminine *par excellence*, are not invariably attached to the female sex in animals. In quite high species we find that the sexes share the task of caring for the young between them or even that the male alone devotes himself to it. Even in the sphere of human sexual life you soon see how inadequate it is to make masculine behaviour coincide with activity and feminine with passivity. A mother is active in every sense towards her child; the act of lactation itself may equally be described as the mother suckling the baby or as her being sucked by it. The further you go from the

narrow sexual sphere the more obvious will the 'error of superimposition'[1] become. Women can display great activity in various directions, men are not able to live in company with their own kind unless they develop a large amount of passive adaptability. If you now tell me that these facts go to prove precisely that both men and women are bisexual in the psychological sense, I shall conclude that you have decided in your own minds to make 'active' coincide with 'masculine' and 'passive' with 'feminine'. But I advise you against it. It seems to me to serve no useful purpose and adds nothing to our knowledge.[2]

One might consider characterizing femininity psychologically as giving preference to passive aims. This is not, of course, the same thing as passivity; to achieve a passive aim may call for a large amount of activity. It is perhaps the case that in a woman, on the basis of her share in the sexual function, a preference for passive behaviour and passive aims is carried over into her life to a greater or lesser extent, in proportion to
[116] the limits, restricted or far-reaching, within which her sexual life thus serves as a model. But we must beware in this of underestimating the influence of social customs, which similarly force women into passive situations. All this is still far from being cleared up. There is one particularly constant relation between femininity and the drives which we do not want to overlook. The suppression of women's aggressiveness which is prescribed for them constitutionally and imposed on them socially favours the development of powerful masochistic impulses, which succeed, as we know, in binding erotically the destructive trends which have been diverted inwards. Thus masochism, as people say, is truly feminine. But if, as happens so often, you meet with masochism in men, what is left to you but to say that these men exhibit very plain feminine traits?

And now you are already prepared to hear that psychology too is unable to solve the riddle of femininity. The explanation must no doubt come from elsewhere, and cannot come till we have learnt how in general the differentiation of living organisms into two sexes came about. We know nothing about it, yet the existence of two sexes is a most striking characteristic of organic life which distinguishes it sharply from inanimate nature. However, we find enough to study in those human

1 [I.e. mistaking two different things for a single one. The term was explained in *Introductory Lectures*, XX; *RSE*, **16**, 268.]

2 [The difficulty of finding a psychological meaning for 'masculine' and 'feminine' was discussed in a long footnote added in 1915 to the *Three Essays* (1905*d*), ibid., **7**, 194 *n.* 1, and again at the beginning of a still longer footnote at the end of Chapter IV of *Civilization and its Discontents* (1930*a*), ibid., **21**, 95–6 *n.* 3.]

individuals who, through the possession of female genitals, are characterized as manifestly or predominantly feminine. In conformity with its peculiar nature, psychoanalysis does not try to describe what a woman is – that would be a task it could scarcely perform – but sets about enquiring how she comes into being, how a woman develops out of a child with a bisexual disposition. In recent times we have begun to learn a little about this, thanks to the circumstance that several of our excellent women colleagues in analysis have begun to work at the question. The discussion of this has gained special attractiveness from the distinction between the sexes. For the ladies, whenever some comparison seemed to turn out unfavourable to their sex, were able to utter a suspicion that we, the male analysts, had been unable to overcome certain deeply rooted prejudices against what was feminine, and that this was being paid for in the partiality of our researches. We, on the other hand, standing on the ground of bisexuality, had no difficulty in avoiding impoliteness. We had only to say: 'This doesn't apply to *you*. You're the exception; on this point you're more masculine than feminine.' [117]

We approach the investigation of the sexual development of women with two expectations. The first is that here once more the constitution will not adapt itself to its function without a struggle. The second is that the decisive turning points will already have been prepared for or completed before puberty. Both expectations are promptly confirmed. Furthermore, a comparison with what happens with boys tells us that the development of a little girl into a normal woman is more difficult and more complicated, since it includes two extra tasks, to which there is nothing corresponding in the development of a man. Let us follow the parallel lines from their beginning. Undoubtedly the material is different to start with in boys and girls: it did not need psychoanalysis to establish that. The difference in the structure of the genitals is accompanied by other bodily differences which are too well known to call for mention. Differences emerge too in the drive disposition which give a glimpse of the later nature of women. A little girl is as a rule less aggressive, defiant and self-sufficient; she seems to have a greater need for being shown affection and on that account to be more dependent and pliant. It is probably only as a result of this pliancy that she can be taught more easily and quicker to control her excretions: urine and faeces are the first gifts that children make to those who look after them [see p. 89 above], and controlling them is the first concession to which the drives of children can be induced. One gets an impression, too, that little girls

are more intelligent and livelier than boys of the same age; they go out more to meet the external world and at the same time form stronger object cathexes. I cannot say whether this lead in development has been confirmed by exact observations, but in any case there is no question that girls cannot be described as intellectually backward. These sexual differences are not, however, of great consequence: they can be outweighed by individual variations. For our immediate purposes they can be disregarded.

Both sexes seem to pass through the early phases of libidinal development in the same manner. It might have been expected that in girls there would already have been some lag in aggressiveness in the sadistic-anal [118] phase, but such is not the case. Analysis of children's play has shown our women analysts that the aggressive impulses of little girls leave nothing to be desired in the way of abundance and violence. With their entry into the phallic phase the differences between the sexes are completely eclipsed by their agreements. We are now obliged to recognize that the little girl is a little man. In boys, as we know, this phase is marked by the fact that they have learnt how to derive pleasurable sensations from their small penis and connect its excited state with their ideas of sexual intercourse. Little girls do the same thing with their still smaller clitoris. It seems that with them all their masturbatory acts are carried out on this penis equivalent, and that the truly feminine vagina is still undiscovered by both sexes. It is true that there are a few isolated reports of early vaginal sensations as well, but it could not be easy to distinguish these from sensations in the anus or vestibulum; in any case they cannot play a great part. We are entitled to keep to our view that in the phallic phase of girls the clitoris is the leading erotogenic zone. But it is not, of course, going to remain so. With the change to femininity the clitoris should wholly or in part hand over its sensitivity, and at the same time its importance, to the vagina. This would be one of the two tasks which a woman has to perform in the course of her development, whereas the more fortunate man has only to continue at the time of his sexual maturity the activity that he has previously carried out at the period of the early efflorescence of his sexuality.

We shall return to the part played by the clitoris; let us now turn to the second task with which a girl's development is burdened. A boy's mother is the first object of his love, and she remains so too during the formation of his Oedipus complex and, in essence, all through his life. For a girl too her first object must be her mother (and the figures of wet-nurses and foster-mothers that merge into her). The first object

cathexes occur in attachment to the satisfaction of the major and simple vital needs,[1] and the circumstances of the care of children are the same for both sexes. But in the Oedipus situation the girl's father has become her love object, and we expect that in the normal course of development she will find her way from this paternal object to her final choice of an [119] object. In the course of time, therefore, a girl has to change her erotogenic zone and her object – both of which a boy retains. The question then arises of how this happens: in particular, how does a girl pass from her mother to an attachment to her father? or, in other words, how does she pass from her masculine phase to the feminine one to which she is biologically destined?

It would be a solution of ideal simplicity if we could suppose that from a particular age onwards the elementary influence of the mutual attraction between the sexes makes itself felt and impels the small woman towards men, while the same law allows the boy to continue with his mother. We might suppose in addition that in this the children are following the pointer given them by the sexual preference of their parents. But we are not going to find things so easy; we scarcely know whether we are to believe seriously in the power of which poets talk so much and with such enthusiasm but which cannot be further dissected analytically. We have found an answer of quite another sort by means of laborious investigations, the material for which at least was easy to arrive at. For you must know that the number of women who remain till a late age tenderly dependent on a paternal object, or indeed on their real father, is very great. We have established some surprising facts about these women with an intense attachment of long duration to their father. We knew, of course, that there had been a preliminary stage of attachment to the mother, but we did not know that it could be so rich in content and so long-lasting, and could leave behind so many opportunities for fixations and dispositions. During this time the girl's father is only a troublesome rival; in some cases the attachment to her mother lasts beyond the fourth year of life. Almost everything that we find later in her relation to her father was already present in this earlier attachment and has been transferred subsequently on to her father. In short, we get an impression that we cannot understand women unless we appreciate this phase of their pre-Oedipus attachment to their mother.

We shall be glad, then, to know the nature of the girl's libidinal relations to her mother. The answer is that they are of very many different kinds. Since they persist through all three phases of infantile sexuality,

1 [Cf. *Introductory Lectures*, XXI; *RSE*, **16**, 289–90.]

[120] they also take on the characteristics of the different phases and express themselves by oral, sadistic-anal and phallic wishes. These wishes represent active as well as passive impulses; if we relate them to the differentiation of the sexes which is to appear later – though we should avoid doing so as far as possible – we may call them masculine and feminine. Besides this, they are completely ambivalent, both affectionate and of a hostile and aggressive nature. The latter often only come to light after being changed into anxiety ideas. It is not always easy to point to a formulation of these early sexual wishes; what is most clearly expressed is a wish to get the mother with child and the corresponding wish to bear her a child – both belonging to the phallic period and sufficiently surprising, but established beyond doubt by analytic observation. The attractiveness of these investigations lies in the surprising detailed findings which they bring us. Thus, for instance, we discover the fear of being murdered or poisoned, which may later form the core of a paranoic illness, already present in this pre-Oedipus period, in relation to the mother. Or another case: you will recall an interesting episode in the history of analytic research which caused me many distressing hours. In the period in which the main interest was directed to discovering infantile sexual traumas, almost all my women patients told me that they had been seduced by their father. I was driven to recognize in the end that these reports were untrue and so came to understand that hysterical symptoms are derived from phantasies and not from real occurrences. It was only later that I was able to recognize in this phantasy of being seduced by the father the expression of the typical Oedipus complex in women. And now we find the phantasy of seduction once more in the pre-Oedipus prehistory of girls; but the seducer is regularly the mother. Here, however, the phantasy touches the ground of reality, for it was really the mother who by her activities over the child's bodily hygiene inevitably stimulated, and perhaps even roused for the first time, pleasurable sensations in her genitals.[1]

1 [In his early discussions of the aetiology of hysteria Freud often mentioned seduction by adults as among its commonest causes (see, for instance, the second paper on the neuropsychoses of defence (1896*b*), *RSE*, **3**, 174 f., and 'The Aetiology of Hysteria' (1896*c*), ibid., **3**, 214). But nowhere in these early publications did he specifically inculpate the girl's father. Indeed, in some additional footnotes written in 1924 for the *Gesammelte Schriften* reprint of *Studies on Hysteria*, he admitted to having on two occasions suppressed the fact of the father's responsibility (see ibid., **2**, 119 *n*. and 151 *n*. 2). He made this quite clear, however, in the letter to Fliess of September 21, 1897 (Freud, 1950*a*, Letter 69), in which he first expressed his scepticism about these stories told by his patients. His first published admission of his mistake was given several years later in a hint in the second of the *Three Essays* (1905*d*), *RSE*, **7**, 169, but a much fuller account of the position followed in his contribution on the aetiology of the neuroses to a volume by Löwenfeld (1906*a*), ibid., **7**, 283–5. Later on he gave two accounts of the effects that this discovery of his mistake had on his own mind – in his 'History of the Psychoanalytic Movement' (1914*d*), ibid., **14**, 14–15, and

I have no doubt you are ready to suspect that this portrayal of the [121]
abundance and strength of a little girl's sexual relations with her mother is very much overdrawn. After all, one has opportunities of seeing little girls and notices nothing of the sort. But the objection is not to the point. Enough can be seen in the children if one knows how to look. And besides, you should consider how little of its sexual wishes a child can bring to preconscious expression or communicate at all. Accordingly we are only within our rights if we study the residues and consequences of this emotional world in retrospect [*nachträglich*], in people in whom these processes of development had attained a specially clear and even excessive degree of expansion. Pathology has always done us the service of making discernible by isolation and exaggeration conditions which would remain concealed in a normal state. And since our investigations have been carried out on people who were by no means seriously abnormal, I think we should regard their outcome as deserving belief.

We will now turn our interest on to the single question of what it is that brings this powerful attachment of the girl to her mother to an end. This, as we know, is its usual fate: it is destined to make room for an attachment to her father. Here we come upon a fact which is a pointer to our further advance. This step in development does not involve only a simple change of object. The turning away from the mother is accompanied by hostility; the attachment to the mother ends in hate. A hate of that kind may become very striking and last all through life; it may be carefully overcompensated later on; as a rule one part of it is overcome while another part persists. Events of later [122]
years naturally influence this greatly. We will restrict ourselves, however, to studying it at the time at which the girl turns to her father and to enquiring into the motives for it. We are then given a long list of accusations and grievances against the mother which are supposed to justify the child's hostile feelings; they are of varying validity which we shall not fail to examine. A number of them are obvious rationalizations and the true sources of enmity remain to be found. I hope you will be interested if on this occasion I take you through all the details of a psychoanalytic investigation.

The reproach against the mother which goes back furthest is that she gave the child too little milk – which is construed against her as lack of

in his *Autobiographical Study* (1925*d*), ibid., **20**, 29–30. The further discovery which is described in the present paragraph of the text had already been indicated in the paper on 'Female Sexuality' (1931*b*), ibid., **21**, 226 f.]

love. Now there is some justification for this reproach in our families. Mothers often have insufficient nourishment to give their children and are content to suckle them for a few months, for half or three-quarters of a year. Among primitive peoples children are fed at their mother's breast for two or three years. The figure of the wet-nurse who suckles the child is as a rule merged into the mother; when this has not happened, the reproach is turned into another one – that the nurse, who fed the child so willingly, was sent away by the mother too early. But whatever the true state of affairs may have been, it is impossible that the child's reproach can be justified as often as it is met with. It seems, rather, that the child's avidity for its earliest nourishment is altogether insatiable, that it never gets over the pain of losing its mother's breast. I should not be surprised if the analysis of a primitive child, who could still suck at its mother's breast when it was already able to run about and talk, were to bring the same reproach to light. The fear of being poisoned is also probably connected with the withdrawal of the breast. Poison is nourishment that makes one ill. Perhaps children trace back their early illnesses too to this frustration. A fair amount of intellectual education is a prerequisite for believing in chance; primitive peoples and uneducated ones, and no doubt children as well, are able to assign a ground for everything that happens. Perhaps originally it was a reason on animistic lines. Even today in some strata of our population no-one can die without having been killed by someone else – preferably by the
[123] doctor. And the regular reaction of a neurotic to the death of someone closely connected with him is to put the blame on himself for having caused the death.

The next accusation against the child's mother flares up when the next baby appears in the nursery. If possible the connection with oral frustration [*Versagung*] is preserved: the mother could not or would not give the child any more milk because she needed the nourishment for the new arrival. In cases in which the two children are so close in age that lactation is prejudiced by the second pregnancy, this reproach acquires a real basis, and it is a remarkable fact that a child, even with an age difference of only 11 months, is not too young to take notice of what is happening. But what the child grudges the unwanted intruder and rival is not only the suckling but all the other signs of maternal care. It feels that it has been dethroned, despoiled, prejudiced in its rights; it casts a jealous hatred upon the new baby and develops a grievance against the faithless mother which often finds expression in a disagreeable change in its behaviour. It becomes 'naughty', perhaps,

irritable and disobedient and goes back on the advances it has made towards controlling its excretions. All of this has been very long familiar and is accepted as self-evident; but we rarely form a correct idea of the strength of these jealous impulses, of the tenacity with which they persist and of the magnitude of their influence on later development. Especially as this jealousy is constantly receiving fresh nourishment in the later years of childhood and the whole shock is repeated with the birth of each new brother or sister. Nor does it make much difference if the child happens to remain the mother's preferred favourite. A child's demands for love are immoderate, they make exclusive claims and tolerate no sharing.

An abundant source of a child's hostility to its mother is provided by its multifarious sexual wishes, which alter according to the phase of the libido and which cannot for the most part be satisfied. The strongest of these frustrations occur at the phallic period, if the mother forbids pleasurable activity with the genitals – often with severe threats and every sign of displeasure – activity to which, after all, she herself had introduced the child. One would think these were reasons enough to account for a girl's turning away from her mother. One would judge, if [124] so, that the estrangement follows inevitably from the nature of children's sexuality, from the immoderate character of their demand for love and the impossibility of fulfilling their sexual wishes. It might be thought indeed that this first love relation of the child's is doomed to dissolution for the very reason that it is the first, for these early object cathexes are regularly ambivalent to a high degree. A powerful tendency to aggressiveness is always present beside a powerful love, and the more passionately a child loves its object the more sensitive does it become to disappointments and frustrations from that object; and in the end the love must succumb to the accumulated hostility. Or the idea that there is an original ambivalence such as this in erotic cathexes may be rejected, and it may be pointed out that it is the special nature of the mother–child relation that leads, with equal inevitability, to the destruction of the child's love; for even the mildest upbringing cannot avoid using compulsion and introducing restrictions, and any such intervention in the child's liberty must provoke as a reaction an inclination to rebelliousness and aggressiveness. A discussion of these possibilities might, I think, be most interesting; but an objection suddenly emerges which forces our interest in another direction. All these factors – the slights, the disappointments in love, the jealousy, the seduction followed by prohibition – are, after all, also in operation in the relation of a *boy*

to his mother and are yet unable to alienate him from the maternal object. Unless we can find something that is specific for girls and is not present or not in the same way present in boys, we shall not have explained the termination of the attachment of girls to their mother.

I believe we have found this specific factor, and indeed where we expected to find it, even though in a surprising form. Where we expected to find it, I say, for it lies in the castration complex. After all, the anatomical distinction [between the sexes] must express itself in psychical consequences. It was, however, a surprise to learn from analyses that girls hold their mother responsible for their lack of a penis and do not forgive her for their being thus put at a disadvantage.

As you hear, then, we ascribe a castration complex to women as well. And for good reasons, though its content cannot be the same as
[125] with boys. In the latter the castration complex arises after they have learnt from the sight of the female genitals that the organ which they value so highly need not necessarily accompany the body. At this the boy recalls to mind the threats he brought on himself by his doings with that organ, he begins to give credence to them and falls under the influence of fear of castration, which will be the most powerful driving force in his subsequent development. The castration complex of girls is also started by the sight of the genitals of the other sex. They at once notice the difference and, it must be admitted, its significance too. They feel seriously wronged, often declare that they want to 'have something like it too', and fall victim to 'envy for the penis', which will leave ineradicable traces on their development and the formation of their character and which will not be surmounted in even the most favourable cases without a severe expenditure of psychical energy. The girl's recognition of the fact of her being without a penis does not by any means imply that she submits to the fact easily. On the contrary, she continues to hold on for a long time to the wish to get something like it herself and she believes in that possibility for improbably long years; and analysis can show that, at a period when knowledge of reality has long since rejected the fulfilment of the wish as unattainable, it persists in the unconscious and retains a considerable cathexis of energy. The wish to get the longed-for penis eventually in spite of everything may contribute to the motives that drive a mature woman to analysis, and what she may reasonably expect from analysis – a capacity, for instance, to carry on an intellectual profession – may often be recognized as a sublimated modification of this repressed wish.

One cannot very well doubt the importance of envy for the penis. You may take it as an instance of male injustice if I assert that envy and jealousy play an even greater part in the mental life of women than of men. It is not that I think these characteristics are absent in men or that I think they have no other roots in women than envy for the penis; but I am inclined to attribute their greater amount in women to this latter influence. Some analysts, however, have shown an inclination to depreciate the importance of this first instalment of penis envy in the phallic phase. They are of the opinion that what we find of this attitude in women is in the main a secondary structure which has come about on [126]
the occasion of later conflicts by regression to this early infantile impulse. This, however, is a general problem of depth psychology. In many pathological – or even unusual – drive attitudes (for instance, in all sexual perversions) the question arises of how much of their strength is to be attributed to early infantile fixations and how much to the influence of later experiences and developments. In such cases it is almost always a matter of complemental series such as we put forward in our discussion of the aetiology of the neuroses.[1] Both factors play a part in varying amounts in the causation; a less on the one side is balanced by a more on the other. The infantile factor sets the pattern in all cases but does not always determine the issue, though it often does. Precisely in the case of penis envy I should argue decidedly in favour of the preponderance of the infantile factor.

The discovery that she is castrated is a turning point in a girl's growth. Three possible lines of development start from it: one leads to sexual inhibition or to neurosis, the second to change of character in the sense of a masculinity complex, the third, finally, to normal femininity. We have learnt a fair amount, though not everything, about all three.

The essential content of the first is as follows: the little girl has hitherto lived in a masculine way, has been able to get pleasure by the excitation of her clitoris and has brought this activity into relation with her sexual wishes directed towards her mother, which are often active ones; now, owing to the influence of her penis envy, she loses her enjoyment in her phallic sexuality. Her self-love is mortified by the comparison with the boy's far superior equipment and in consequence she renounces her masturbatory satisfaction from her clitoris, repudiates her love for her mother and at the same time not infrequently represses a good part of her sexual trends in general. No doubt her turning away from her mother does not occur all at once, for to begin

1 [See *Introductory Lectures*, XXII and XXIII; *RSE*, **16**, 306, 319 f. and 321.]

with the girl regards her castration as an individual misfortune, and only gradually extends it to other females and finally to her mother as well. Her love was directed to her *phallic* mother; with the discovery that her mother is castrated it becomes possible to drop her as an object, so that
[127] the motives for hostility, which have long been accumulating, gain the upper hand. This means, therefore, that as a result of the discovery of women's lack of a penis they are debased in value for girls just as they are for boys and later perhaps for men.

You all know the immense aetiological importance attributed by our neurotic patients to their masturbation. They make it responsible for all their troubles and we have the greatest difficulty in persuading them that they are mistaken. In fact, however, we ought to admit to them that they are right, for masturbation is the executive agent of infantile sexuality, from the faulty development of which they are indeed suffering. But what neurotics mostly blame is the masturbation of the period of puberty; they have mostly forgotten that of early infancy, which is what is really in question. I wish I might have an opportunity some time of explaining to you at length how important all the factual details of early masturbation become for the individual's subsequent neurosis or character: whether or not it was discovered, how the parents struggled against it or permitted it, or whether he succeeded in suppressing it himself. All of this leaves permanent traces on his development. But I am on the whole glad that I need not do this. It would be a hard and tedious task and at the end of it you would put me in an embarrassing situation by quite certainly asking me to give you some practical advice as to how a parent or educator should deal with the masturbation of small children.[1] From the development of girls, which is what my present lecture is concerned with, I can give you the example of a child herself trying to get free from masturbating. She does not always succeed in this. If envy for the penis has provoked a powerful impulse against clitoridal masturbation but this nevertheless refuses to give way, a violent struggle for liberation ensues in which the girl, as it were, herself takes over the role of her deposed mother and gives expression to her entire dissatisfaction with her inferior clitoris in her efforts against
[128] obtaining satisfaction from it. Many years later, when her masturbatory activity has long since been suppressed, an interest still persists which we must interpret as a defence [*Abwehr*] against a temptation that is still

1 [Freud's fullest discussion of masturbation was in his contributions to a symposium on the subject in the Vienna Psychoanalytical Society (1912*f*), *RSE*, **12**, 237 ff., where a number of other references are given.]

dreaded. It manifests itself in the emergence of sympathy for those to whom similar difficulties are attributed, it plays a part as a motive in contracting a marriage and, indeed, it may determine the choice of a husband or lover. Disposing of early infantile masturbation is truly no easy or indifferent business.

Along with the abandonment of clitoridal masturbation a certain amount of activity is renounced. Passivity now has the upper hand, and the girl's turning to her father is accomplished principally with the help of passive drive impulses. You can see that a wave of development like this, which clears the phallic activity out of the way, smooths the ground for femininity. If too much is not lost in the course of it through repression, this femininity may turn out to be normal. The wish with which the girl turns to her father is no doubt originally the wish for the penis which her mother has refused her and which she now expects from her father. The feminine situation is only established, however, if the wish for a penis is replaced by one for a baby, if, that is, a baby takes the place of a penis in accordance with an ancient symbolic equivalence [p. 88 f. above]. It has not escaped us that the girl has wished for a baby earlier, in the undisturbed phallic phase: that, of course, was the meaning of her playing with dolls. But that play was not, in fact, an expression of her femininity; it served as an identification with her mother with the intention of substituting activity for passivity. *She* was playing the part of her mother and the doll was herself: now she could do with the baby everything that her mother used to do with her. Not until the emergence of the wish for a penis does the doll-baby become a baby from the girl's father, and thereafter the aim of the most powerful feminine wish. Her happiness is great if later on this wish for a baby finds fulfilment in reality, and quite especially so if the baby is a little boy who brings the longed-for penis with him.[1] Often enough in her combined picture of 'a baby from her father' the emphasis is laid on the baby and her father left unstressed. In this way the ancient masculine wish for the possession of a penis is still faintly visible through the femininity now achieved. But perhaps we ought rather to recognize this wish for a penis as being [129]
par excellence a feminine one.

With the transference of the wish for a penis-baby on to her father, the girl has entered the situation of the Oedipus complex. Her hostility to her mother, which did not need to be freshly created, is now greatly intensified, for she becomes the girl's rival, who receives from her father everything that she desires from him. For a long time the girl's Oedipus

1 [See p. 117 f. below.]

complex concealed her pre-Oedipus attachment to her mother from our view, though it is nevertheless so important and leaves such lasting fixations behind it. For girls the Oedipus situation is the outcome of a long and difficult development; it is a kind of preliminary solution, a position of rest which is not soon abandoned, especially as the beginning of the latency period is not far distant. And we are now struck by a difference between the two sexes, which is probably momentous, in regard to the relation of the Oedipus complex to the castration complex. In a boy the Oedipus complex, in which he desires his mother and would like to get rid of his father as being a rival, develops naturally from the phase of his phallic sexuality. The threat of castration compels him, however, to give up that attitude. Under the impression of the danger of losing his penis, the Oedipus complex is abandoned, repressed and, in the most normal cases, entirely destroyed [see p. 81 above], and a severe superego is set up as its heir. What happens with a girl is almost the opposite. The castration complex prepares for the Oedipus complex instead of destroying it; the girl is driven out of her attachment to her mother through the influence of her envy for the penis and she enters the Oedipus situation as though into a haven of refuge. In the absence of fear of castration the chief motive which leads boys to surmount the Oedipus complex is lacking. Girls remain in it for an indeterminate length of time; they demolish it late and, even so, incompletely. In these circumstances the formation of the superego must suffer; it cannot attain the strength and independence which give it its cultural significance, and feminists are not pleased when we point out to them the effects of this factor upon the average feminine character.

To go back a little. We mentioned [p. 111] as the second possible reaction to the discovery of female castration the development of a powerful
[130] masculinity complex. By this we mean that the girl refuses, as it were, to recognize the unwelcome fact and, defiantly rebellious, even exaggerates her previous masculinity, clings to her clitoridal activity and takes refuge in an identification with her phallic mother or her father. What can it be that decides in favour of this outcome? We can only suppose that it is a constitutional factor, a greater amount of activity, such as is ordinarily characteristic of a male. However that may be, the essence of this process is that at this point in development the wave of passivity is avoided which opens the way to the turn towards femininity. The extreme achievement of such a masculinity complex would appear to be the influencing of the choice of an object in the sense of manifest homosexuality. Analytic experience teaches us, to be sure, that female

homosexuality is seldom or never a direct continuation of infantile masculinity. Even for a girl of this kind it seems necessary that she should take her father as an object for some time and enter the Oedipus situation. But afterwards, as a result of her inevitable disappointments from her father, she is driven to regress into her early masculinity complex. The significance of these disappointments must not be exaggerated; a girl who is destined to become feminine is not spared them, though they do not have the same effect. The predominance of the constitutional factor seems indisputable; but the two phases in the development of female homosexuality are well mirrored in the practices of homosexuals, who play the parts of mother and baby with each other as often and as clearly as those of husband and wife.

What I have been telling you here may be described as the prehistory of women. It is a product of the very last few years and may have been of interest to you as an example of detailed analytic work. Since its subject is woman, I will venture on this occasion to mention by name a few of the women who have made valuable contributions to this investigation. Dr Ruth Mack Brunswick [1928*b*] was the first to describe a case of neurosis which went back to a fixation in the pre-Oedipus stage and had never reached the Oedipus situation at all. The case took the form of jealous paranoia and proved accessible to therapy. Dr Jeanne Lampl-de Groot [1927] has established the incredible phallic activity of girls towards their mother by some assured observations, and Dr Helene [131]
Deutsch [1932] has shown that the erotic actions of homosexual women reproduce the relations between mother and baby.

It is not my intention to pursue the further behaviour of femininity through puberty to the period of maturity. Our knowledge, moreover, would be insufficient for the purpose. But I will bring a few features together in what follows. Taking its prehistory as a starting point, I will emphasize here only that the development of femininity remains exposed to disturbance by the residual phenomena of the early masculine period. Regressions to the fixations of the pre-Oedipus phases very frequently occur; in the course of some women's lives there is a repeated alternation between periods in which masculinity or femininity gains the upper hand. Some portion of what we men call 'the enigma of women' may perhaps be derived from this expression of bisexuality in women's lives. But another question seems to have become ripe for judgement in the course of these researches. We have called the driving force of sexual life 'the libido'. Sexual life is dominated by the polarity

of masculine–feminine; thus the notion suggests itself of considering the relation of the libido to this antithesis. It would not be surprising if it were to turn out that each sexuality had its own special libido appropriated to it, so that one sort of libido would pursue the aims of a masculine sexual life and another sort those of a feminine one. But nothing of the kind is true. There is only one libido, which serves both the masculine and the feminine sexual functions. To it itself we cannot assign any sex; if, following the conventional equation of activity and masculinity, we are inclined to describe it as masculine, we must not forget that it also covers trends with a passive aim. Nevertheless, the juxtaposition 'feminine libido' is without any justification. Furthermore, it is our impression that more constraint has been applied to the libido when it is pressed into the service of the feminine function, and that – to speak teleologically – Nature takes less careful account of its [that function's] demands than in the case of masculinity. And the reason for this may lie – thinking once again teleologically – in the fact that the accomplishment of the aim of biology has been entrusted to the aggressiveness of men and has been made to some extent independent of women's consent.

[132] The sexual frigidity of women, the frequency of which appears to confirm this disregard, is a phenomenon that is still insufficiently understood. Sometimes it is psychogenic and in that case accessible to influence; but in other cases it suggests the hypothesis of its being constitutionally determined and even of there being a contributory anatomical factor.

I have promised to tell you of a few more psychical peculiarities of mature femininity, as we come across them in analytic observation. We do not lay claim to more than an average validity for these assertions; nor is it always easy to distinguish what should be ascribed to the influence of the sexual function and what to social breeding. Thus, we attribute a larger amount of narcissism to femininity, which also affects women's choice of object, so that to be loved is a stronger need for them than to love. The effect of penis envy has a share, further, in the physical vanity of women, since they are bound to value their charms more highly as a late compensation for their original sexual inferiority.[1] Shame, which is considered to be a feminine characteristic *par excellence* but is far more a matter of convention than might be supposed, has as its purpose, we believe, concealment of genital deficiency. We are not forgetting that at a later time shame takes on other functions. It seems that women have made few contributions to the discoveries and

1 [Cf. 'On Narcissism' (1914*c*), *RSE*, **14**, 77.]

inventions in the history of civilization; there is, however, one technique which they may have invented – that of plaiting and weaving. If that is so, we should be tempted to guess the unconscious motive for the achievement. Nature herself would seem to have given the model which this achievement imitates by causing the growth at maturity of the pubic hair that conceals the genitals. The step that remained to be taken lay in making the threads adhere to one another, while on the body they stick into the skin and are only matted together. If you reject this idea as fantastic and regard my belief in the influence of lack of a penis on the configuration of femininity as an *idée fixe*, I am of course defenceless.

The determinants of women's choice of an object are often made unrecognizable by social conditions. Where the choice is able to show itself freely, it is often made in accordance with the narcissistic ideal of the man whom the girl had wished to become. If the girl has remained [133] in her attachment to her father – that is, in the Oedipus complex – her choice is made according to the paternal type. Since, when she turned from her mother to her father, the hostility of her ambivalent relation remained with her mother, a choice of this kind should guarantee a happy marriage. But very often the outcome is of a kind that presents a general threat to such a settlement of the conflict due to ambivalence. The hostility that has been left behind follows in the train of the positive attachment and spreads over on to the new object. The woman's husband, who to begin with inherited from her father, becomes after a time her mother's heir as well. So it may easily happen that the second half of a woman's life may be filled by the struggle against her husband, just as the shorter first half was filled by her rebellion against her mother. When this reaction has been lived through, a second marriage may easily turn out very much more satisfying.[1] Another alteration in a woman's nature, for which lovers are unprepared, may occur in a marriage after the first child is born. Under the influence of a woman's becoming a mother herself, an identification with her own mother may be revived, against which she had striven up till the time of her marriage, and this may attract all the available libido to itself, so that the compulsion to repeat reproduces an unhappy marriage between her parents. The difference in a mother's reaction to the birth of a son or a daughter shows that the old factor of lack of a penis has even now not lost its strength. A mother is only brought unlimited satisfaction by her relation to a son;

1 [This had already been remarked upon earlier, in 'The Taboo of Virginity' (1918*a*), *RSE*, **11**, 194 f.]

this is altogether the most perfect, the most free from ambivalence of all human relationships.[1] A mother can transfer to her son the ambition which she has been obliged to suppress in herself, and she can expect from him the satisfaction of all that has been left over in her of her masculinity complex. Even a marriage is not made secure until the wife
[134] has succeeded in making her husband her child as well and in acting as a mother to him.

A woman's identification with her mother allows us to distinguish two strata: the pre-Oedipus one which rests on her affectionate attachment to her mother and takes her as a model, and the later one from the Oedipus complex which seeks to get rid of her mother and take her place with her father. We are no doubt justified in saying that much of both of them is left over for the future and that neither of them is adequately surmounted in the course of development. But the phase of the affectionate pre-Oedipus attachment is the decisive one for a woman's future: during it preparations are made for the acquisition of the characteristics with which she will later fulfil her role in the sexual function and perform her invaluable social tasks. It is in this identification too that she acquires her attractiveness to a man, whose Oedipus attachment to his mother it kindles into passion. How often it happens, however, that it is only his son who obtains what he himself aspired to! One gets an impression that a man's love and a woman's are a phase apart psychologically.

The fact that women must be regarded as having little sense of justice is no doubt related to the predominance of envy in their mental life; for the demand for justice is a modification of envy and lays down the condition subject to which one can put envy aside. We also regard women as weaker in their social interests and as having less capacity for sublimating their drives than men. The former is no doubt derived from the dissocial quality which unquestionably characterizes all sexual relations. Lovers find sufficiency in each other, and families too resist inclusion in more comprehensive associations.[2] The aptitude for sublimation is subject to the greatest individual variations. On the other hand, I cannot help mentioning an impression that we are constantly receiving during analytic practice. A man of about thirty strikes us as a youthful, somewhat unformed individual, whom we expect to make powerful use of the possibilities for development opened up to him by

1 [This point seems to have been made by Freud first in the *Introductory Lectures*, XIII; *RSE*, **15**, 179. He repeated it in a footnote to Chapter VI of *Group Psychology* (1921*c*), ibid., **18**, 94 *n*. 2.]

2 [Cf. some remarks on this in Chapter XII (D) of *Group Psychology* (1921*c*), ibid., **18**, 130 f.]

analysis. A woman of the same age, however, often frightens us by her psychical rigidity and unchangeability. Her libido has taken up final [135]
positions and seems incapable of exchanging them for others. There are no paths open to further development; it is as though the whole process had already run its course and remains thenceforward insusceptible to influence – as though, indeed, the difficult development to femininity had exhausted the possibilities of the person concerned. As therapists we lament this state of things, even if we succeed in putting an end to our patient's ailment by doing away with her neurotic conflict.

That is all I had to say to you about femininity. It is certainly incomplete and fragmentary and does not always sound friendly. But do not forget that I have been describing women only insofar as their nature is determined by their sexual function. It is true that that influence extends very far; but we do not overlook the fact that an individual woman may be a human being in other respects as well. If you want to know more about femininity, enquire from your own experiences of life, or turn to the poets, or wait until science can give you deeper and more coherent information.

LECTURE XXXIV

EXPLANATIONS, APPLICATIONS AND ORIENTATIONS

[136] Ladies and Gentlemen, perhaps you will allow me for once, as a relief from the dry tone of these lectures, to talk to you about some things which have very little theoretical significance but which concern you closely insofar as you are friendlily disposed to psychoanalysis. Let us imagine, for instance, that in your leisure hours you take up a German, English or American novel, in which you expect to find an account of contemporary people and society. After a few pages you come upon a first comment on psychoanalysis and soon afterwards upon others, even though the context does not seem to call for them. You must not imagine that it is a question of applying depth psychology to a better understanding of the characters in the book or of their actions – though, incidentally, there are other and more serious works in which an attempt of that kind is in fact made. No, these are for the most part facetious remarks intended by the author to display his wide reading and intellectual superiority. Nor will you always form an impression that he really knows what he is talking about. Again, you may go as a recreation to a social gathering – and this need not necessarily happen in Vienna. After a short time the conversation turns upon psychoanalysis and you will hear the greatest variety of people passing their judgement on it, mostly in voices of unwavering certainty. It is quite usual for the judgement to be contemptuous or often slanderous or at least, once again, facetious. If you are so imprudent as to betray the fact that you know something about the subject, they fall upon you with one accord, ask for information and explanations and soon convince you that all these severe judgements had been arrived at without any basis of knowledge, that scarcely any of these critics had ever opened an analytic book or, if they had, had gone beyond the first resistance aroused by their contact with this new material.

[137] You may perhaps expect an introduction to psychoanalysis to give you instructions, too, on what arguments you should use to correct these obvious errors about analysis, what books you should recommend

to give more accurate information, or even what examples you should bring up in the discussion from your reading or experience in order to alter the company's attitude. I must beg you to do none of this. It would be useless. The best plan would be for you to conceal your superior knowledge altogether. If that is no longer possible, limit yourself to saying that, so far as you can make out, psychoanalysis is a special branch of knowledge, very hard to understand and to form an opinion on, which is concerned with very serious things, so that a few jokes will not bring one to close quarters with it – and that it would be better to find some other plaything for social entertainment. Nor, of course, will you join in attempts at interpretation if unwary people repeat their dreams; and you will resist the temptation to curry favour for analysis by retailing reports of its cures.

But you may raise the question of why these people – both the ones who write books and the conversationalists – behave so badly; and you may incline to the view that the responsibility for this lies not only on them but also on psychoanalysis. I think so too. What you come upon as prejudice in literature and society is an after-effect of an earlier judgement – the judgement, namely, that was formed upon the young psychoanalysis by the representatives of official science. I once complained of this in a historical account I wrote,[1] and I shall not do so again – perhaps that once was too often – but it is a fact that there was no violation of logic, and no violation of propriety and good taste, to which the scientific opponents of psychoanalysis did not give way at that time. The situation recalled what was actually put in practice in the Middle Ages when an evil-doer, or even a mere political opponent, was put in the pillory and given over to maltreatment by the mob [*Pöbel*]. You may not realize clearly, perhaps, how far upwards in our society mob characteristics extend, and what misconduct people will be guilty of when they feel themselves part of a crowd [*Massenbestandteil*] and relieved of personal responsibility. At the beginning of that time I was more or less alone and I soon saw that there was no future in polemics but that [138]
it was equally senseless to lament and to invoke the help of kindlier spirits, for there were no courts to which such appeals could be made. So I took another road. I made a first application of psychoanalysis by explaining to myself that this behaviour of the crowd [*Masse*] was a manifestation of the same resistance which I had to struggle against in individual patients. I refrained from polemics myself and influenced my adherents, when little by little they appeared, in the same direction. This

1 ['On the History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 17–19 and 33–5.]

procedure was the right one. The interdict which lay upon psychoanalysis in those days has been lifted since then. But, just as an abandoned faith survives as a superstition, just as a theory which has been given up by science continues to exist as a popular belief, so the original outlawing of psychoanalysis by scientific circles persists today in the facetious contempt of the laymen who write books or make conversation. So this will no longer surprise you.

But you must not expect to hear the glad tidings that the struggle about analysis is over and has ended in its recognition as a science and its admission as a subject for instruction at universities. There is no question of that. The struggle continues, though in more polite forms. What is also new is that a sort of buffer layer has formed in scientific society between analysis and its opponents. This consists of people who allow the validity of some portions of analysis and admit as much, subject to the most entertaining qualifications, but who on the other hand reject other portions of it, a fact which they cannot proclaim too loudly. It is not easy to divine what determines their choice in this. It seems to depend on personal sympathies. One person will take objection to sexuality, another to the unconscious; what seems particularly unpopular is the fact of symbolism. Though the structure of psychoanalysis is unfinished, it nevertheless presents, even today, a unity from which elements cannot be broken off at the caprice of whoever comes along: but these eclectics seem to disregard this. I have never had the impression that these half or quarter adherents based their rejection on an examination of the facts. Some distinguished men, too, are included in this category. They, to be sure, are excused by the fact that their time and their interest belong to other things – to those things, namely, in mastering which they have achieved so much. But in that case would they not do
[139] better to suspend their judgement instead of taking sides so decisively? With one of these great men I once succeeded in effecting a rapid conversion. He was a world-famous critic, who had followed the spiritual currents of the time with benevolent understanding and prophetic penetration. I came to know him only when he was past his eightieth year; but he was still enchanting in his talk. You will easily guess whom I mean.[1] Nor was it I who introduced the subject of psychoanalysis. It was

1 [It was Georg Brandes, the celebrated Danish scholar (1842–1927), for whom Freud had always had an admiration. Freud had heard him lecture in Vienna in March, 1900. He was enthusiastic, and, on his wife's suggestion, sent a copy of *The Interpretation of Dreams* to Brandes at his hotel; but it is not known whether there was any reaction. See Letter 131 of the Fliess correspondence (Freud, 1950*a*). Ernest Jones mentions their meeting (which took place in 1925) in the third volume of his biography (1957, 120). Freud gave another account of it in a letter of April 19, 1927, to one of his nieces (Letter 229 in Freud, 1960*a*).]

he who did so, by comparing himself with me in the most modest fashion. 'I am only a literary man,' he said, 'but you are a natural scientist and discoverer. However, there is one thing I must say to you: I have never had sexual feelings towards my mother.' 'But there is no need at all for you to have known them,' was my reply; 'to grown-up people those are unconscious feelings.' 'Oh! so *that's* what you think!' he said with relief, and pressed my hand. We went on talking together on the best of terms for another few hours. I heard later that in the few remaining years of his life he often spoke of analysis in a friendly way and was pleased at being able to use a word that was new to him – 'repression'.

There is a common saying that we should learn from our enemies. I confess I have never succeeded in doing so; but I thought all the same that it might be instructive for you if I undertook a review of all the reproaches and objections which the opponents of psychoanalysis have raised against it, and if I went on to point out the injustices and offences against logic which could so easily be revealed in them. But 'on second thoughts'[1] I told myself that it would not be at all interesting but would become tedious and distressing and would be precisely what I have been so carefully avoiding all these years. So you must forgive me if I pursue [140]
this path no further and if I spare you the judgements of our so-called scientific opponents. After all it is nearly always a question of people whose one qualification is the impartiality which they have preserved by keeping at a distance from the experiences of psychoanalysis. But I know there are other cases in which you will not let me off so lightly. 'Nevertheless', you will tell me, 'there are such a number of people to whom your last remark does not apply. They have not evaded analytic experience, they have analysed patients and have perhaps been analysed themselves; for a time they have even been your collaborators. Yet they have arrived at other views and theories on the basis of which they have seceded from you and founded independent schools of psychoanalysis. You ought to throw some light for us on the possibility and significance of these secessionist movements which have been so frequent in the history of analysis.'

Well, I will try to do so; but only in brief, since they contribute less to an understanding of analysis than you might expect. I feel sure you will be thinking in the first place of Adler's 'Individual Psychology', which, in America for instance, is regarded as a line of thought collateral with

1 [In English in the original.]

our psychoanalysis and on a par with it and which is regularly mentioned alongside of it. Actually, Individual Psychology has very little to do with psychoanalysis but, as a result of certain historical circumstances, leads a kind of parasitic existence at its expense. The determinants which we have attributed to this group of opponents apply to the founder of Individual Psychology only to a limited extent. Its very name is inappropriate and seems to have been the product of embarrassment. We cannot allow the legitimate use of the term as an antithesis to 'group psychology' to be interfered with; moreover, our own activity is concerned for the most part and primarily with the psychology of human individuals. I shall not enter today upon an objective criticism of Adler's Individual Psychology; there is no place for it in the plan of these introductory lectures. Besides, I have already attempted it once, and feel no temptation to change anything in what I said then.[1] I
[141] will, however, illustrate the impression his views produce by a small episode dating from the years before analysis.

In the neighbourhood of the little Moravian town in which I was born, and which I left when I was a three-year-old child,[2] there is a modest health resort, prettily situated in the woods. During my schooldays I went there several times in the holidays. Some twenty years later the illness of a near relative was the occasion for my visiting the place again. In the course of a conversation with the physician attached to the spa, who had attended my relative, I enquired among other things about his relations with the peasants – Slovaks, I believe – who constituted his whole clientele during the winter. He told me that his medical practice proceeded as follows. In his consulting hours the patients came into his room and stood in a row. One after another stepped forward and described his complaint: he had backache or pains in his stomach or had tired legs, and so on. The doctor then examined him and, after satisfying himself as to what was the matter, called out the diagnosis, which was the same in every case. He translated the word to me; it meant approximately 'bewitched'. I asked in astonishment whether the peasants made no objection to his verdict being the same with every patient. 'Oh, no!'

1 [Freud's main criticism of Adler's views was made in his 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 44–51. In the Editors' Note to that paper (ibid., 3–4) some references are given to other passages in Freud's writings where the matter is discussed. It will perhaps seem surprising that Jung's defection is not alluded to in the present lecture, apart from the short unidentified reference on p. 126 below, and that Freud expected Adler's views to be given first place by his readers. This is in agreement with some remarks in the 'History' in which he says that 'of the two movements under discussion Adler's is indubitably the more important' (*RSE*, **14**, 52).]

2 [Freiberg, afterwards renamed Příbor. See (1931*e*), ibid., **21**, 252.]

he replied, 'they are very pleased with it: it is what they expected. Each of them, as he went back to his place in the row, showed the others by looks and gestures that I was a fellow who understood things.' Little did I guess at the time in what circumstances I should come across an analogous situation once again.

For, whether a man is a homosexual or a necrophilic, a hysteric suffering from anxiety, an obsessional neurotic cut off from society, or a raving lunatic, the 'Individual Psychologist' of the Adlerian school will declare that the driving motive [*treibende Motiv*] of his condition is that he wishes to assert himself, to overcompensate for his inferiority, to remain 'on top', to pass from the feminine to the masculine line. In my [142]
young student days we used to hear something very much the same in the out-patients' department when a case of hysteria was introduced: hysterical patients, we were told, produce their symptoms to make themselves interesting, to draw attention to themselves. It is a remarkable thing how these ancient pieces of wisdom keep on cropping up. But even at that time this fragment of psychology did not seem to cover the riddle of hysteria. It left unexplained, for instance, why the patients used no other methods for attaining their purpose. There must, of course, be *something* correct in this theory of the 'Individual Psychologists': a small particle is taken for the whole. The self-preservative drive will try to profit by every situation; the ego will seek to turn even illness to its advantage. In psychoanalysis this is known as the 'secondary gain from illness'.[1] Though, indeed, when we think of the facts of masochism, of the unconscious need for punishment and of neurotic self-injury, which make plausible the hypothesis of there being drive impulses that run contrary to self-preservation, we even feel shaken in our belief in the general validity of the commonplace truth on which the theoretical structure of Individual Psychology is erected. But a theory such as this is bound to be very welcome to the great mass of the people, a theory which recognizes no complications, which introduces no new concepts that are hard to grasp, which knows nothing of the unconscious, which gets rid at a single blow of the universally oppressive problem of sexuality and which restricts itself to the discovery of the artifices by which people seek to make life easy. For the mass [*grossen Menge*] of the people themselves take things easily: they call for no more than a single reason by way of explanation, they do not thank science for its diffuseness, they want to have simple solutions and to know that problems are solved. When we consider how very far

1 [Cf. *Introductory Lectures*, XXIV; *RSE*, **16**, 338 f.]

Individual Psychology goes in meeting these demands, we cannot suppress the recollection of a sentence in *Wallenstein*:

> Wär' der Gedank' nicht so verwünscht gescheidt,
> Man wär' versucht, ihn herzlich dumm zu nennen.[1]

[143] Criticism from specialist circles, which is so relentless against psychoanalysis, has in general handled Individual Psychology with kid gloves. It is true that in America one of the most highly respected psychiatrists published a paper against Adler under the title 'Enough', in which he gave energetic expression to his boredom at the 'compulsion to repeat' of Individual Psychology. If others have treated it far more amiably, no doubt their antagonism to analysis has had much to do with it.

I need not say much about other schools which have branched off from our psychoanalysis. The fact that they have done so cannot be used either for or against the validity of psychoanalytic theories. You have only to think of the strong emotional factors that make it hard for many people to fit themselves in with others or to subordinate themselves, and of the still greater difficulty justly insisted on by the dictum 'Quot capita tot sensus'.[2] When the differences of opinion had gone beyond a certain point, the most sensible thing was to part and thereafter to proceed along our different ways – especially when the theoretical divergence involved a change in practical procedure. Suppose, for instance, that an analyst[3] attaches little value to the influence of the patient's personal past and looks for the causation of neuroses exclusively in present-day motives and in expectations of the future. In that case he will also neglect the analysis of childhood; he will have to adopt an entirely different technique and will have to make up for the omission of the events from the analysis of childhood by increasing his didactic influence and by directly indicating certain particular aims in life. We for our part will then say: 'This may be a school of wisdom; but it is no longer analysis.' Or someone else[4] may arrive at the view that the experience of anxiety at birth sows the seed of all later neurotic disturbances. It may thereupon seem to him legitimate to restrict analysis to the consequences of

1 [Were the idea not so confounded clever,
I'd be inclined to call it really stupid.
Schiller, *Die Piccolomini*, Act II, Scene 7.]

2 [More usually given in the form (derived from Terence, *Phormio*, Act II, Scene 4), 'Quot homines tot sententiae (As many men, so many opinions)'.]

3 [The allusion is to Jung.]

4 [Here Rank is referred to.]

this single impression and to promise therapeutic success from a treatment lasting from three to four months. As you will observe, I have chosen two examples which start from diametrically opposite premises. It is an almost universal characteristic of these 'secessionist movements' that each of them takes hold of one fragment out of the wealth of [144]
themes in psychoanalysis and makes itself independent on the basis of this seizure – selecting the drive to mastery, for instance, or ethical conflict, or the [importance of the] mother, or genitality, and so on. If it appears to you that secessions of this sort are already more numerous today in the history of psychoanalysis than in other intellectual movements, I am not sure that I should agree with you. If it is the case, the responsibility must be laid on the intimate relations which exist in psychoanalysis between theoretical views and therapeutic treatment. Mere differences of opinion would be tolerable for far longer. People like accusing us psychoanalysts of intolerance. The only manifestation of this ugly characteristic has been precisely our parting from those who think differently from us. No other harm has been done to them. On the contrary, they have fallen on their feet, and are better off than they were before. For by their separation they have usually freed themselves of one of the burdens which weigh us down – the odium of infantile sexuality, perhaps, or the absurdity of symbolism – and are regarded by their environment as passably respectable, which is still not true of those of us who are left behind. Moreover, apart from one notable exception, it was they who excluded themselves.[1]

What further claims do you make in the name of tolerance? That when someone has uttered an opinion which we regard as completely false we should say to him: 'Thank you very much for having given voice to this contradiction. You are guarding us against the danger of complacency and are giving us an opportunity of showing the Americans that we are really as "broad-minded"[2] as they always wish. To be sure, we do not believe a word of what you are saying, but that makes no difference. Probably you are just as right as we are. After all, who can possibly know who is right? In spite of our antagonism, pray allow us to represent your point of view in our publications. We hope that you will be kind enough in exchange to find a place for our views which you deny.' In the future, when the misuse of Einstein's relativity has been entirely achieved, this will obviously become the regular custom in scientific affairs. For the moment, it is true, we have not gone quite so far.

1 [This may possibly refer to Stekel.]

2 [In English in the original.]

We restrict ourselves, in the old fashion, to putting forward only our
[145] own convictions, we expose ourselves to the risk of error because it cannot be guarded against, and we reject what is in contradiction to us. We have made plentiful use in psychoanalysis of the right to change our opinions if we think we have found something better.

One of the first applications of psychoanalysis was to teach us to understand the opposition offered to us by our contemporaries because we practised psychoanalysis. Other applications, of an objective nature, may claim a more general interest. Our first purpose, of course, was to understand the disorders of the human mind, because a remarkable experience had shown that here understanding and cure almost coincide, that a traversable road leads from the one to the other.[1] And for a long time it was our only purpose. Then, however, we perceived the close relations, the internal identity indeed, between pathological processes and what are known as normal ones. Psychoanalysis became a depth psychology; and, since nothing that men make or do is understandable without the cooperation of psychology, the applications of psychoanalysis to numerous fields of knowledge, in particular to those of the mental sciences, came about of their own accord, pushed their way to the front and called for ventilation. These tasks unluckily came up against obstacles which, rooted as they were in the circumstances, have not yet been overcome even today. An application of this kind presupposes specialized knowledge which an analyst does not possess, while those who possess it, the specialists, know nothing of analysis and perhaps want to know nothing. The result has been that analysts, as amateurs with an equipment of greater or lesser adequacy, often hastily scraped together, have made excursions into such fields of knowledge as mythology, the history of civilization [*Kulturgeschichte*], ethnology, the science of religion and so on. They were no better treated by the experts resident in those fields than are trespassers in general: their methods and their findings, insofar as they attracted attention, were in the first instance rejected. But these conditions are constantly improving, and in every region there is a growing number of people who study psychoanalysis in order to make use of it in their special subject, and in
[146] order, as colonists, to replace the pioneers. Here we may expect a rich harvest of new discoveries. Applications of analysis are always confirmations of it as well. There, too, where scientific work is further

1 [Breuer's treatment of his first patient. See *Introductory Lectures*, XVIII; *RSE*, **16**, 246 f.]

removed from practical activity, the inevitable differences of opinion will no doubt take a less embittered form.

I feel a strong temptation to conduct you through all the applications of psychoanalysis to the mental sciences. They are things worth knowing by anyone with intellectual interests; and not to hear about abnormality and illness for a time would be a well-deserved relaxation. But I must renounce the idea: it would once more carry us outside the framework of these lectures and, I must honestly admit, I should not be equal to the task. It is true that in a few of these regions I myself took the first step; but today I no longer embrace the whole field, and I should have to do a great deal of studying in order to master what has been accomplished since my beginnings. Any of you who are disappointed by my refusal may make up for it in the pages of our periodical *Imago*, which is designed to cover the non-medical applications of analysis.[1]

But there is one topic which I cannot pass over so easily – not, however, because I understand particularly much about it or have contributed very much to it. Quite the contrary: I have scarcely concerned myself with it at all.[2] I must mention it because it is so exceedingly important, so rich in hopes for the future, perhaps the most important of all the activities of analysis. What I am thinking of is the application of psychoanalysis to education [*Pädagogik*], to the upbringing [*Erziehung*][T] of the next generation. I am glad that I am at least able to say that my [147]
daughter, Anna Freud, has made this study her life-work and has in that way compensated for my neglect.

The road that led to this application is easily traced. When in the treatment of an adult neurotic we followed up the determinants of his symptoms, we were regularly led back to his early childhood. A knowledge of the later aetiological factors was not sufficient either for understanding the case or for producing a therapeutic effect. We were therefore compelled to make ourselves acquainted with the psychical

1 [See *Introductory Lectures*, X; *RSE*, **15**, 146.]

2 [Though this is perhaps the longest of Freud's discussions on the relations between analysis and education, it is in fact far from being the only one. Apart from numerous incidental references, the question was considered by him at some length in Section III of Chapter III of the 'Little Hans' case history (1909*b*), ibid., **10**, 107–12; and he dealt with it again in his prefaces to two books, one by Pfister (1913*b*), ibid., **12**, 327 ff., and the other by Aichhorn (1925*f*), ibid., **19**, 279 ff. The special problems connected with sex education were the theme of an early paper on 'The Sexual Enlightenment of Children' (1907*c*), ibid., **9**, 111 ff., and were touched on again thirty years later in the last paragraph of Section IV of 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 211. Lastly it may be mentioned that the question of religious education had come up at several points in Chapters IX and X of *The Future of an Illusion* (1927*c*), ibid., **21**, 43 ff. and 48 ff.]

peculiarities of childhood; we learnt a quantity of things which could not have been learnt except through analysis, and we were able to put right many opinions that were generally held about childhood. We recognized that particular importance attached to the first years of childhood – up to the age of five, perhaps – for several reasons. Firstly, because those years include the early efflorescence of sexuality which leaves behind it decisive instigating factors for the sexual life of maturity. Secondly, because the impressions of this period impinge upon an immature and feeble ego, and act upon it like traumas. The ego cannot fend off [*erwehren*] the emotional storms which they provoke in any way except by repression and in this manner acquires in childhood all its dispositions to later illnesses and functional disturbances. We realized that the difficulty of childhood lies in the fact that in a short span of time a child has to appropriate the results of a cultural evolution which stretches over thousands of years, including the acquisition of control over his drives and adaptation to society – or at least the first beginnings of these two. He can only achieve a part of this modification through his own development; much must be imposed on him by education.[1] We are not surprised that children often carry out this task very imperfectly. During these early times many of them pass through states that may be put on a par with neuroses – and this is certainly so in the case of all those who produce manifest illnesses later on. In some children the neurotic illness does not wait till maturity but breaks out already in childhood and gives parents and doctors plenty of trouble.

[148] We had no misgivings over applying analytic treatment to children who either exhibited unambiguous neurotic symptoms or who were on the road to an unfavourable development of character. The apprehension expressed by opponents of analysis that the child would be injured by it proved unfounded. What we gained from these undertakings was that we were able to confirm on the living subject what we had inferred (from historical documents, as it were) in the case of adults. But the gain for the children was also very satisfactory. It turned out that a child is a very favourable subject for analytic therapy; the results are thorough and lasting. The technique of treatment worked out for adults must, of course, be largely altered for children. A child is psychologically a different object from an adult. As yet he possesses no superego, the method of free association [*freien Assoziation*] does not carry far with him,

1 [As discussed in *RSE*, **24**, 66, the German word '*Erziehung*', which is here and elsewhere in this discussion translated 'education', has a much wider meaning than the English word and includes 'upbringing' in a general sense.]

transference (since the real parents are still on the spot) plays a different part. The internal resistances against which we struggle in adults are replaced for the most part in children by external difficulties. If the parents make themselves vehicles of the resistance, the aim of the analysis – and even the analysis itself – is often imperilled. Hence it is often necessary to combine with a child's analysis a certain amount of analytic influencing of his parents. On the other hand, the inevitable deviations of analyses of children from those of adults are diminished by the circumstance that some of our patients have retained so many infantile character traits that the analyst (once again adapting himself to his subject) cannot avoid making use with them of certain of the techniques of child analysis. It has automatically happened that child analysis has become the domain of women analysts, and no doubt this will remain true.

The recognition that most of our children pass through a neurotic phase in the course of their development carries with it the germ of a hygienic challenge. The question may be raised whether it would not be expedient to come to a child's help with an analysis even if he shows no signs of a disturbance, as a measure for safeguarding his health, just as today we inoculate healthy children against diphtheria without waiting to see if they fall ill of it. The discussion of this question has only an academic interest at present, but I may venture to consider it here. The mere suggestion would seem to the great bulk of our contemporaries to [149] be a monstrous outrage, and in view of the attitude towards analysis of most people in a parental position any hope of putting through such an idea must be abandoned for the time being. Prophylaxis such as this against neurotic illness, which would probably be very effective, also presupposes a quite other constitution of society. The watchword for the application of psychoanalysis to education is to be found today elsewhere. Let us make ourselves clear as to what the first task of education is. The child must learn to control his drives. It is impossible to give him liberty to carry out all his impulses without restriction. To do so would be a very instructive experiment for child psychologists; but life would be impossible for the parents and the children themselves would suffer grave damage, which would show itself partly at once and partly in later years. Accordingly, education must inhibit, forbid and suppress, and this it has abundantly seen to in all periods of history. But we have learnt from analysis that precisely this suppression of drives involves the risk of neurotic illness. As you will remember, we have examined in detail how this occurs.[1] Thus education has to find its way

1 [See *Introductory Lectures*, in particular Lectures XXII and XXIII. The educational dilemma is discussed there in *RSE*, **16**, 313 and 322.]

between the Scylla of non-interference and the Charybdis of frustration. Unless this problem is entirely insoluble, an optimum must be discovered which will enable education to achieve the most and damage the least. It will therefore be a matter of deciding how much to forbid, at what times and by what means. And in addition we have to take into account the fact that the objects of our educational influence have very different innate constitutional dispositions, so that it is quite impossible that the same educational procedure can be equally good for all children. A moment's reflection tells us that hitherto education has fulfilled its task very badly and has done children great damage. If it discovers the optimum and carries out its task ideally, it can hope to wipe out one of the factors in the aetiology of falling ill – the influence of the accidental traumas of childhood. It cannot in any case get rid of the other factor – the power of an insubordinate drive constitution. If now we consider the difficult problems that confront the educator – how he has
[150] to recognize the child's constitutional individuality, to infer from small indications what is going on in his immature mind, to give him the right amount of love and yet to maintain an effective degree of authority – we shall tell ourselves that the only appropriate preparation for the profession of educator is a thorough psychoanalytic training. It would be best that he should have been analysed himself, for, when all is said and done, it is impossible to assimilate analysis without experiencing it personally. The analysis of teachers and educators seems to be a more efficacious prophylactic measure than the analysis of children themselves, and there are fewer difficulties in the way of putting it into practice.

We may mention, though only as an incidental consideration, an indirect way in which the upbringing of children may be helped by analysis and which may with time acquire a greater influence. Parents who have themselves experienced an analysis and owe much to it, including an insight into the faults of their own upbringing, will treat their children with better understanding and will spare them much of what they themselves were not spared.

Parallel with the efforts of analysts to influence education, other investigations are being made into the origin and prevention of delinquency and crime. Here again I am only opening the door for you and showing you the rooms that lie beyond it, without leading you inside.[1] I am certain that if you remain loyal to your interest in psychoanalysis

1 [See, in this connection, Freud's Preface to Aichhorn's *Wayward Youth* (Freud, 1925*f*), *RSE*, **19**, 279 ff.]

you will be able to learn much that is new and valuable on these subjects. I must not, however, leave the topic of education without referring to one particular aspect of it. It has been said – and no doubt justly – that every education has a partisan aim, that it endeavours to bring the child into line with the established order of society, without considering how valuable or how stable that order may be in itself. If [it is argued] one is convinced of the defects in our present social arrangements, education with a psychoanalytic alignment cannot justifiably be put at their service as well: it must be given another and higher aim, liberated from the prevailing demands of society. In my opinion, however, this argument is out of place here. Such a demand goes beyond the legitimate function of analysis. In the same way, it is not the business of a doctor who is [151] called in to treat a case of pneumonia to concern himself with whether the patient is an honest man or a suicide or a criminal, whether he deserves to remain alive or whether one ought to wish him to. This other aim which it is desired to give to education will also be a partisan one, and it is not the affair of an analyst to decide between the parties. I am leaving entirely on one side the fact that psychoanalysis would be refused any influence on education if it admitted to intentions inconsistent with the established social order. Psychoanalytic education will be taking an uninvited responsibility on itself if it proposes to mould its pupils into rebels. It will have played its part if it sends them away as healthy and efficient as possible. It itself contains enough revolutionary factors to ensure that no-one educated by it will in later life take the side of reaction and suppression. It is even my opinion that revolutionary children are not desirable from any point of view.

I propose further, ladies and gentlemen, to say a few words to you about psychoanalysis as a form of therapy. I discussed the theoretical side of this question fifteen years ago[1] and I cannot formulate it in any other manner today; I have now to tell you of our experience during this interval. As you know, psychoanalysis originated as a method of treatment; it has far outgrown this, but it has not abandoned its home ground and it is still linked to its contact with patients for increasing its depth and for its further development. The accumulated impressions from which we derive our theories could be arrived at in no other way. The failures we meet with as therapists are constantly setting us new tasks and the demands of real life are an effective guard against an overgrowth of the speculation which we cannot after all do without in

1 [In *Introductory Lectures*, XXVII and XXVIII; *RSE*, **16**, 381 ff. and 396 ff.]

our work. I have already discussed long ago the means used by psychoanalysis in helping patients, when it does help them, and the method by which it does so;[1] today I shall enquire how much it achieves.

[152] You are perhaps aware that I have never been a therapeutic enthusiast; there is no danger of my misusing this lecture by indulging in eulogies. I would rather say too little than too much. During the period at which I was the only analyst, people who were ostensibly friendly to my ideas used to say to me: 'That's all very nice and clever; but show me a case that you have cured by analysis.' This was one of the many formulas which in the course of time have succeeded one another in performing the function of pushing the uncomfortable novelty aside. Today it is as out of date as many others: the analyst, too, has a heap of letters in his files from grateful patients who have been cured. The analogy does not stop at that. Psychoanalysis is really a method of treatment like others. It has its triumphs and its defeats, its difficulties, its limitations, its indications. At one time a complaint was made against analysis that it was not to be taken seriously as a treatment since it did not dare to issue any statistics of its successes. Since then, the Psychoanalytic Institute in Berlin, which was founded by Dr Max Eitingon, has published a statement of its results during its first ten years.[2] Its therapeutic successes give grounds neither for boasting nor for being ashamed. But statistics of that kind are in general uninstructive; the material worked upon is so heterogeneous that only very large numbers would show anything. It is wiser to examine one's individual experiences. And here I should like to add that I do not think our cures can compete with those of Lourdes. There are so many more people who believe in the miracles of the Blessed Virgin than in the existence of the unconscious. If we turn to mundane competitors, we must compare psychoanalytic treatment with other kinds of psychotherapy. Today organic physical methods of treating neurotic states need scarcely be mentioned. Analysis as a psychotherapeutic procedure does not stand in opposition to other methods used in this specialized branch of medicine; it does not diminish their value nor exclude them. There is no theoretical inconsistency in a doctor who likes to call himself a psychotherapist using analysis on his patients alongside of any other method of treatment according to the peculiarities of the case and the favourable or unfavourable external circumstances. It is in fact technique that necessitates the specialization in medical practice. Thus in the same way surgery and

1 [See footnote, p. 133 above, and the papers on technique in *RSE*, **12**, 83 ff.]

2 [Freud contributed a Preface to this (1930*b*), ibid., **21**, 248.]

orthopaedics were obliged to separate. Psychoanalytic activity is arduous and exacting; it cannot well be handled like a pair of glasses that one puts on for reading and takes off when one goes for a walk. As a rule psychoanalysis possesses a doctor either entirely or not at all. Those psychotherapists who make use of analysis among other methods, occasionally, do not to my knowledge stand on firm analytic ground; they have not accepted the whole of analysis but have watered it down – have drawn its fangs, perhaps; they cannot be counted as analysts. This is, I think, to be regretted. But cooperation in medical practice between an analyst and a psychotherapist who restricts himself to other techniques would serve quite a useful purpose. [153]

Compared with the other psychotherapeutic procedures psychoanalysis is beyond any doubt the most powerful. It is just and fair, too, that this should be so for it is also the most laborious and time-consuming; it would not be used on slight cases. In suitable cases it is possible by its means to get rid of disturbances and bring about changes for which in pre-analytic times one would not have ventured to hope. But it has its very appreciable limits. The therapeutic ambition of some of my adherents has made the greatest efforts to overcome these obstacles so that every sort of neurotic disorder might be curable by psychoanalysis. They have endeavoured to compress the work of analysis into a shorter duration, to intensify transference so that it may be able to overcome any resistance, to unite other forms of influence with it so as to compel a cure. These efforts are certainly praiseworthy, but, in my opinion, they are in vain. They bring with them, too, a danger of being oneself forced away from analysis and drawn into a boundless course of experimentation.[1] The expectation that every neurotic phenomenon can be cured may, I suspect, be derived from the layman's belief that the neuroses are something quite unnecessary which have no right whatever to exist. Whereas in fact they are severe, constitutionally fixed illnesses, which rarely restrict themselves to only a few attacks but persist as a rule over long periods or throughout life. Our analytic experience that they can be extensively influenced, if the historical precipitating causes and accidental auxiliary factors of the illness can be dealt with, has led us to neglect the constitutional factor in our therapeutic practice, and in any case we can do nothing about it; but in theory we ought always to bear it in mind. The radical inaccessibility of the [154]

1 [It may well be that in writing these sentences Freud had his friend Ferenczi in mind, whose obituary, which he was to write a few months later, contains an echo of these ideas. See below, p. 243.]

psychoses to analytic treatment should, in view of their close relationship to the neuroses, restrict our pretensions in regard to these latter. The therapeutic effectiveness of psychoanalysis remains cramped by a number of weighty and scarcely assailable factors. In the case of children, where one might count on the greatest successes, the difficulties are the external ones connected with their relation to their parents, though these difficulties are after all a necessary part of being a child. In the case of adults the difficulties arise in the first instance from two factors: the amount of psychical rigidity present and the form of the illness with all that that covers in the way of deeper determinants.

The first of these factors is often unjustly overlooked. However great may be the plasticity of mental life and the possibility of reviving old conditions, not everything can be brought to life again. Some changes seem to be definitive and correspond to scars formed when a process has run its course. On other occasions one has an impression of a general stiffening of mental life; the psychical processes, to which one could very well indicate other paths, seem incapable of abandoning the old ones. But perhaps this is the same thing as what I mentioned just now, only looked at differently. All too often one seems to see that it is only the treatment's lack of the necessary driving force [*Triebkraft*] that prevents one from bringing the change about. One particular dependent relation, one special drive component, is too powerful in comparison with the opposing forces that we are able to mobilize. This is quite generally true with the psychoses. We understand them well enough to know the point at which the levers should be applied, but they would not be able to move the weight. It is here, indeed, that hope for the future lies: the possibility that our knowledge of the operation of the hormones (you know what they are) may give us the means of successfully combating the quantitative factors of the illnesses: but we are far from that today. I realize that the uncertainty in all these matters is a constant instigation towards perfecting analysis and in particular the transference. Beginners in analysis especially are left in doubt in case of a failure whether [155] they should blame the peculiarities of the case or their own clumsy handling of the therapeutic procedure. But, as I have said already, I do not think much can be achieved by efforts in this direction.

The second limitation upon analytic successes is given by the form of the illness. You know already that the field of application of analytic therapy lies in the transference neuroses – phobias, hysteria, obsessional neurosis – and further, abnormalities of character which have been

developed in place of these illnesses. Everything differing from these, narcissistic and psychotic conditions, is unsuitable to a greater or lesser extent. It would be entirely legitimate to guard against failures by carefully excluding such cases. This precaution would lead to a great improvement in the statistics of analysis. There is, however, a pitfall here. Our diagnoses are very often made only after the event [*nachträglich*]. They resemble the Scottish king's test for identifying witches that I read about in Victor Hugo.[1] This king declared that he was in possession of an infallible method of recognizing a witch. He had the women stewed in a cauldron of boiling water and then tasted the broth. Afterwards he was able to say: 'That was a witch', or 'No, that was not one.' It is the same with us, except that *we* are the sufferers. We cannot judge the patient who comes for treatment (or, in the same way, the candidate who comes for training) till we have studied him analytically for a few weeks or months. We are in fact buying a pig in a poke. The patient brings along indefinite general ailments which do not admit of a conclusive diagnosis. After this period of testing it may turn out that the case is an unsuitable one. If so we send him away if he is a candidate, or continue the trial a little longer if he is a patient on the chance that we may yet see things in a more favourable light. The patient has his revenge by adding to our list of failures, and the rejected candidate does so perhaps, if he is paranoid, by writing books on psychoanalysis himself. As you see, our precautions have been of no avail.

I am afraid these detailed discussions are exhausting your interest. But [156]
I should be still more sorry if you were to think it is my intention to lower your opinion of psychoanalysis as a therapy. Perhaps I really made a clumsy start. For I wanted to do the opposite: to excuse the therapeutic limitations of analysis by pointing out their inevitability. With the same aim in view I turn to another point: the reproach against analytic treatment that it takes a disproportionately long time. On this it must be said that psychical changes do in fact only take place slowly; if they occur rapidly, suddenly, that is a bad sign. It is true that the treatment of a fairly severe neurosis may easily extend over several years; but consider, in case of success, how long the illness would have lasted. A decade, probably, for every year of treatment: the illness, that is to say (as we see so often in untreated cases), would not have ended at all. In some cases we have reasons for resuming an analysis many years afterwards. Life had developed fresh pathological reactions to fresh

1 [The origin of this anecdote has not been found. Freud had already used it in his contribution to a discussion on masturbation (1912*f*), *RSE*, **12**, 248.]

precipitating causes; but in the meantime our patient had been well. The first analysis had not in fact brought to light all his pathological dispositions, and it was natural for the analysis to have been stopped when success was achieved. There are also severely handicapped people who are kept under analytic supervision all through their lives and are taken back into analysis from time to time. But these people would otherwise have been altogether incapable of existence and we must feel glad that they can be kept on their feet by this piecemeal and recurrent treatment. The analysis of character disorders also calls for long periods of treatment; but it is often successful; and do you know of any other therapy with which such a task could even be approached? Therapeutic ambition may feel unsatisfied by such results; but we have learnt from the example of tuberculosis and lupus that success can only be obtained when the treatment has been adapted to the characteristics of the illness.[1]

I have told you that psychoanalysis began as a method of treatment; but I did not want to commend it to your interest as a method of treatment but on account of the truths it contains, on account of the information
[157] it gives us about what concerns human beings most of all – their own nature – and on account of the connections it discloses between the most different of their activities. As a method of treatment it is one among many, though, to be sure, *primus inter pares*. If it was without therapeutic value it would not have been discovered, as it was, in connection with sick people and would not have gone on developing for more than thirty years.

1 [One of the very last of Freud's writings, 'Analysis Terminable and Interminable' (1937*c*), is devoted to a long discussion of the limitations of psychoanalytic therapy; *RSE*, **23**, 195 ff.]

LECTURE XXXV

THE QUESTION OF A *WELTANSCHAUUNG*[1]

Ladies and Gentlemen, at our last meeting we were occupied with little [158]
everyday concerns – putting our own modest house in order, as it were. I propose that we should now take a bold leap and venture upon answering a question which is constantly being asked in other quarters: does psychoanalysis lead to a particular *Weltanschauung* and, if so, to which?

'*Weltanschauung*' is, I am afraid, a specifically German concept, the translation of which into foreign languages might well raise difficulties. If I try to give you a definition of it, it is bound to seem clumsy to you. In my opinion, then, a *Weltanschauung* is an intellectual construction which solves all the problems of our existence uniformly on the basis of one overriding hypothesis, which, accordingly, leaves no question unanswered and in which everything that interests us finds its fixed place. It will easily be understood that the possession of a *Weltanschauung* of this kind is among the ideal wishes of human beings. Believing in it one can feel secure in life, one can know what to strive for, and how one can deal most expediently with one's emotions and interests.

If that is the nature of a *Weltanschauung*, the answer as regards psychoanalysis is made easy. As a specialist science, a branch of psychology – a depth psychology or psychology of the unconscious – it is quite unfit to construct a *Weltanschauung* of its own: it must accept the scientific one. But the *Weltanschauung* of science already departs noticeably from our definition. It is true that it too assumes the *uniformity* of the explanation of the world; but it does so only as a programme, the fulfilment of which [159]
is relegated to the future. Apart from this it is marked by negative characteristics, by its limitation to what is at the moment knowable and by its sharp rejection of certain elements that are alien to it. It asserts that there are no sources of knowledge of the world other than the intellectual working over of carefully scrutinized observations – in other words, what we

1 [This word might be translated 'philosophy of life' or, literally, 'world view', but Freud himself explains its meaning in the second paragraph below. As it appears more than thirty times in the course of this lecture, the simplest plan seems to be to leave it in German; and in any case it has almost naturalized itself in our language. Freud had already approached the topic of this lecture in a passage at the end of Chapter II of *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 85.]

call research – and alongside of it no knowledge derived from revelation, intuition or divination. It seems as though this view came very near to being generally recognized in the course of the last few centuries that have passed; and it has been left to *our* century to discover the presumptuous objection that a *Weltanschauung* like this is alike paltry and cheerless, that it overlooks the claims of the human intellect [*Menschengeistes*] and the needs of the human mind [*Seele*].

This objection cannot be too energetically repudiated. It is quite without a basis, since the intellect and the mind are objects for scientific research in exactly the same way as any non-human things. Psychoanalysis has a special right to speak for the scientific *Weltanschauung* at this point, since it cannot be reproached with having neglected what is mental in the picture of the world. Its contribution to science lies precisely in having extended research to the mental field. And, incidentally, without such a psychology science would be very incomplete. If, however, the investigation of the intellectual and emotional functions of men (and of animals) is included in science, then it will be seen that nothing is altered in the attitude of science as a whole, that no new sources of knowledge or methods of research have come into being. Intuition and divination would be such, if they existed; but they may safely be reckoned as illusions, the fulfilments of wishful impulses. It is easy to see, too, that these demands upon a *Weltanschauung* are only based on emotion. Science takes notice of the fact that the human mind produces these demands and is ready to examine their sources; but it has not the slightest reason to regard them as justified. On the contrary, it sees this as a warning carefully to separate from knowledge everything that is illusion and an outcome of emotional demands like these.

This does not in the least mean that these wishes are to be pushed
[160] contemptuously on one side or their value for human life underestimated. We are ready to trace out the fulfilments of them which they have created for themselves in the products of art and in the systems of religion and philosophy; but we cannot nevertheless overlook the fact that it would be illegitimate and highly inexpedient to allow these demands to be transferred to the sphere of knowledge. For this would be to lay open the paths which lead to psychosis, whether to individual or group psychosis, and would withdraw valuable amounts of energy from endeavours which are directed towards reality in order, so far as possible, to find satisfaction in it for wishes and needs.

From the standpoint of science one cannot avoid exercising one's critical faculty here and proceeding with rejections and dismissals. It is

not permissible to declare that science is one field of human mental activity and that religion and philosophy are others, at least its equal in value, and that science has no business to interfere with the other two: that they all have an equal claim to be true and that everyone is at liberty to choose from which he will draw his convictions and in which he will place his belief. A view of this kind is regarded as particularly superior, tolerant, broad-minded and free from illiberal prejudices. Unfortunately it is not tenable and shares all the pernicious features of an entirely unscientific *Weltanschauung* and is equivalent to one in practice. It is simply a fact that the truth cannot be tolerant, that it admits of no compromises or limitations, that research regards every sphere of human activity as belonging to it and that it must be relentlessly critical if any other power tries to take over any part of it.

Of the three powers which may dispute the basic position of science, religion alone is to be taken seriously as an enemy. Art is almost always harmless and beneficent; it does not seek to be anything but an illusion. Except for a few people who are spoken of as being 'possessed' by art, it makes no attempt at invading the realm of reality. Philosophy is not opposed to science, it behaves like a science and works in part by the same methods; it departs from it, however, by clinging to the illusion of being able to present a picture of the world which is without gaps and is coherent, though one which is bound to collapse with every fresh advance in our knowledge. It goes astray in its method by overestimating the epistemological value of our logical operations and by accepting other sources [161] of knowledge such as intuition. And it often seems that the poet's derisive comment is not unjustified when he says of the philosopher:

> Mit seinen Nachtmützen und Schlafrockfetzen
> Stopft er die Lücken des Weltenbaus.[1]

But philosophy has no direct influence on the great mass of mankind; it is of interest to only a small number even of the top layer of intellectuals and is scarcely intelligible to anyone else. On the other hand, religion is an immense power which has the strongest emotions of human beings at its service. It is well known that at an earlier date it comprised everything that played an intellectual part in men's lives, that it took the place of science when there was scarcely yet such a thing as

1 Heine, ['Die Heimkehr', LVIII. Literally 'With his nightcaps and the tatters of his dressing-gown he patches up the gaps in the structure of the world.' The lines were favourite ones with Freud. He alluded to them in connection with the secondary revision of dreams in Chapter VI (I) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 438 f., and again in a letter to Jung of February 25, 1908 (Jones, 1955, 488). Many years earlier he had quoted them in full in a letter to his future wife (who was a distant relative of Heine's), in July, 1883 (Jones, 1953, 214).]

science, and that it constructed a *Weltanschauung*, consistent and self-contained to an unparalleled degree, which, although it has been profoundly shaken, persists to this day.

If we are to give an account of the grandiose [*grossartigen*] nature of religion, we must bear in mind what it undertakes to do for human beings. It gives them information about the origin and coming into existence of the world, it assures them of its protection and of ultimate happiness in the ups and downs of life and it directs their thoughts and actions by precepts which it lays down with its whole authority. Thus it fulfils three functions. With the first of them it satisfies the human thirst for knowledge; it does the same thing that science attempts to do with *its* means, and at that point enters into rivalry with it. It is to its second function that it no doubt owes the greatest part of its influence. Science can be no match for it when it soothes the fear [*Angst*] that men feel of the dangers and vicissitudes [*Wechselfällen*] of life, when it assures them of a happy ending and offers them comfort in unhappiness. It is true that science can teach us how to avoid certain dangers and that there
[162] are some sufferings which it can successfully combat; it would be most unjust to deny that it is a powerful helper to men; but there are many situations in which it must leave a man to his suffering and can only advise him to submit to it. In its third function, in which it issues precepts and lays down prohibitions and restrictions, religion is furthest away from science. For science is content to investigate and to establish facts, though it is true that from its application rules and advice are derived on the conduct of life. In some circumstances these are the same as those offered by religion, but, when this is so, the reasons for them are different.

The convergence between these three aspects of religion is not entirely clear. What has an explanation of the origin of the world to do with the inculcation of certain particular ethical precepts? The assurances of protection and happiness are more intimately linked with the ethical requirements. They are the reward for fulfilling these commands; only those who obey them may count upon these benefits, punishment awaits the disobedient. Incidentally, something similar is true of science. Those who disregard its lessons, so it tells us, expose themselves to injury.

The remarkable combination in religion of instruction, consolation and requirements can only be understood if it is subjected to a genetic [*genetischen*] analysis. This may be approached from the most striking point of the aggregate, from its instruction on the origin of the universe;

for why, we may ask, should a cosmogony be a regular component of religious systems? The doctrine is, then, that the world was created by a being resembling a man, but magnified in every respect, in power, wisdom and the strength of his passions – an idealized superman [*Übermenschen*]. Animals as creators of the world point to the influence of totemism, upon which we shall have a few words at least to say presently. It is an interesting fact that this creator is always only a single being, even when there are believed to be many gods. It is interesting, too, that the creator is usually a man, though there is far from being a lack of indications of female deities; and some mythologies actually make the creation begin with a male god getting rid of a female deity,[1] who is degraded into being a monster. Here the most interesting problems of detail open out; but we must hurry on. Our further path is made [163] easy to recognize, for this god-creator is undisguisedly called 'father'. Psychoanalysis infers that he really is the father, with all the magnificence in which he once appeared to the small child. A religious man pictures the creation of the world just as he pictures his own origin.

This being so, it is easy to explain how it is that consoling assurances and strict ethical demands are combined with a cosmogony. For the same person to whom the child owed his existence, the father (or more correctly, no doubt, the parental agency compounded of the father and mother), also protected and watched over him in his feeble and helpless state, exposed as he was to all the dangers lying in wait in the external world; under his father's protection he felt safe. When a human being has himself grown up, he knows, to be sure, that he is in possession of greater strength, but his insight into the perils of life has also grown greater, and he rightly concludes that fundamentally he still remains just as helpless and unprotected as he was in his childhood, that faced with the world he is still a child. Even now, therefore, he cannot do without the protection which he enjoyed as a child. But he has long since recognized, too, that his father is a being of narrowly restricted power, and not equipped with every excellence. He therefore harks back to the mnemic image of the father whom in his childhood he so greatly overvalued. He exalts the image into a deity and makes it into something contemporary and real. The effective strength of this mnemic image and the persistence of his need for protection jointly sustain his belief in God.

The third main item in the religious programme, the ethical demand,

1 [Freud had considerably more to say about female deities in Essay III, Part I, Section D, of *Moses and Monotheism* (1939*a*), *RSE*, **23**, 77.]

also fits into this childhood situation with ease. I may remind you of Kant's famous pronouncement in which he names, in a single breath, the starry heavens and the moral law within us [see p. 55 above].[1] However strange this juxtaposition may sound – for what have the heavenly
[164] bodies to do with the question of whether one human creature loves another or kills him? – it nevertheless touches on a great psychological truth. The same father (or parental agency) which gave the child life and guarded him against its perils taught him as well what he might do and what he must leave undone, instructed him that he must adapt himself to certain restrictions on his drive wishes, and made him understand what regard he was expected to have for his parents and brothers and sisters, if he wanted to become a tolerated and welcome member of the family circle and later on of larger associations. The child is brought up to a knowledge of his social duties by a system of loving rewards and punishments, he is taught that his security in life depends on his parents (and afterwards other people) loving him and on their being able to believe that he loves them. All these relations are afterwards introduced by men unaltered into their religion. Their parents' prohibitions and demands persist within them as a moral conscience. With the help of this same system of rewards and punishments, God rules the world of men. The amount of protection and happy satisfaction assigned to an individual depends on his fulfilment of the ethical demands; his love of God and his consciousness of being loved by God are the foundations of the security with which he is armed against the dangers of the external world and of his human environment. Finally, in prayer he has assured himself a direct influence on the divine will and with it a share in the divine omnipotence.

I feel sure that while you have been listening to me you have been bothered by a number of questions which you would be glad to hear answered. I cannot undertake to do so here and now, but I feel confident that none of these detailed enquiries would upset our thesis that the religious *Weltanschauung* is determined by the situation of our childhood. That being so, it is all the more remarkable that, in spite of its infantile nature, it nevertheless had a precursor. There is no doubt that there was a time without religion, without gods. This is known as the

1 [In the original edition the present sentence read: 'In a famous pronouncement the philosopher Kant named the existence of the starry heavens and that of the moral law within us as the most powerful witnesses to the greatness of God.' It was changed to the form translated above in the *GS* (1934) – the earlier quotation of the same passage having no doubt been previously overlooked.]

stage of animism. At that time, too, the world was peopled with spiritual beings resembling men – we call them demons. All the objects in the external world were their habitation, or perhaps were identical to them; but there was no superior power which had created them all and afterwards ruled them and to which one could turn for protection and help. [165] The demons of animism were for the most part hostile in their attitude to human beings, but it appears that human beings had more self-confidence then than later on. They were certainly in a constant state of the most acute fear of these evil spirits; but they defended themselves against them by certain actions to which they ascribed the power to drive them away. Nor apart from this did they regard themselves as defenceless. If they desired something from Nature – if they wished for rain, for instance – they did not direct a prayer to the weather god, but they performed a magical act which they expected to influence Nature directly: they themselves did something which resembled rain. In their struggle against the powers of the world around them their first weapon was *magic*, the earliest forerunner of the technology of today. Their reliance on magic was, as we suppose, derived from their overvaluation of their own intellectual operations, from their belief in the 'omnipotence of thoughts', which, incidentally, we come upon again in our obsessional neurotic patients.[1] We may suppose that human beings at that period were particularly proud of their acquisitions in the way of language, which must have been accompanied by a great facilitation of thinking. They attributed magical power to words. This feature was later taken over by religion. 'And God said "Let there be light!" and there was light.' Moreover, the fact of their magical actions shows that animistic men did not simply rely on the power of their wishes. They expected results, rather, from the performance of an action which would induce Nature to imitate it. If they wanted rain, they themselves poured out water; if they wanted to encourage the earth to be fruitful, they demonstrated a dramatic performance of sexual intercourse to it in the fields.

You know how hard it is for anything to die away when once it has achieved psychical expression. So you will not be surprised to hear that many of the utterances of animism have persisted to this day, for the most part as what we call superstition, alongside of and behind religion. But more than this, you will scarcely be able to reject a judgement that the philosophy of today has retained some essential features of the [166]

1 [For all of this see the third essay in *Totem and Taboo* (1912–13*a*), particularly Section 3; *RSE*, **13**, 84 ff.]

animistic mode of thought – the overvaluation of the magic of words and the belief that the real events in the world take the course which our thinking seeks to impose on them. It would seem, it is true, to be an animism without magical actions. On the other hand, we may suppose that even in those days there were ethics of some sort, precepts upon the mutual relations of men; but nothing suggests that they had any intimate connection with animistic beliefs. They were probably the direct expression of men's relative powers and of their practical needs.

It would be well worth knowing what brought about the transition from animism to religion, but you may imagine the obscurity which today still veils these primaeval ages of the evolution of the human spirit [*Menschengeistes*]. It appears to be a fact that the first form assumed by religion was the remarkable phenomenon of totemism, the worship of animals, in whose train the first ethical commandments, the taboos, made their appearance. In a volume called *Totem and Taboo* [1912–13*a*], I once elaborated a notion which traced this transformation back to a revolution in the circumstances of the human family. The main achievement of religion as compared with animism lies in the psychical binding of the fear of demons. Nevertheless, a vestige of this primaeval age, the Evil Spirit, has kept a place in the religious system.

This being the prehistory of the religious *Weltanschauung*, let us turn now to what has happened since then and to what is still going on before our eyes. The scientific spirit, strengthened by the observation of natural processes, has begun, in the course of time, to treat religion as a human affair and to submit it to a critical examination. Religion was not able to stand up to this. What first gave rise to suspicion and scepticism were its tales of miracles, for they contradicted everything that had been taught by sober observation and betrayed too clearly the influence of the activity of the human imagination. After this its doctrines explaining the origin of the world met with rejection, for they gave evidence of an ignorance which bore the stamp of ancient times and to which, thanks to their increased familiarity with the laws of Nature, people knew they were superior. The idea that the world came
[167] into existence through acts of copulation or creation analogous to the origin of individual people had ceased to be the most obvious and self-evident hypothesis since the distinction between animate creatures with a mind and an inanimate Nature had impressed itself on human thought – a distinction which made it impossible to retain belief in the original animism. Nor must we overlook the influence of the

comparative study of different religious systems and the impression of their mutual exclusiveness and intolerance.

Strengthened by these preliminary exercises, the scientific spirit gained enough courage at last to venture on an examination of the most important and emotionally valuable elements of the religious *Weltanschauung*. People may always have seen, though it was long before they dared to say so openly, that the pronouncements of religion promising men protection and happiness if they would only fulfil certain ethical requirements had also shown themselves unworthy of belief. It seems not to be the case that there is a Power in the universe which watches over the well-being of individuals with parental care and brings all their affairs to a happy ending. On the contrary, the destinies of mankind can be brought into harmony neither with the hypothesis of a Universal Benevolence nor with the partly contradictory one of a Universal Justice. Earthquakes, tidal waves, conflagrations, make no distinction between the virtuous and pious and the scoundrel or unbeliever. Even where what is in question is not inanimate Nature but where an individual's fate depends on his relations to other people, it is by no means the rule that virtue is rewarded and that evil finds its punishment. Often enough the violent, cunning or ruthless man seizes the envied good things of the world and the pious man goes away empty. Obscure, unfeeling and unloving powers determine men's fate; the system of rewards and punishments which religion ascribes to the government of the world seems not to exist. Here once again is a reason for dropping a portion of the animistic theory which had been rescued from animism by religion.

The last contribution to the criticism of the religious *Weltanschauung* was effected by psychoanalysis, by showing how religion originated from the helplessness of children and by tracing its contents to the survival into maturity of the wishes and needs of childhood. This did not precisely mean a contradiction of religion, but it was nevertheless a [168]
necessary rounding off of our knowledge about it, and in one respect at least it was a contradiction, for religion itself lays claim to a divine origin. And, to be sure, it is not wrong in this, provided that our interpretation of God is accepted.

In summary, therefore, the judgement of science on the religious *Weltanschauung* is this. While the different religions wrangle with one another as to which of them is in possession of the truth, our view is that the question of the truth of religious beliefs may be left altogether on one side. Religion is an attempt to master the sensory world in which

we are situated by means of the wishful world which we have developed within us as a result of biological and psychological necessities. But religion cannot achieve this. Its doctrines bear the imprint of the times in which they arose, the ignorant times of the childhood of humanity. Its consolations deserve no trust. Experience teaches us that the world is no nursery. The ethical demands on which religion seeks to lay stress need, rather, to be given another basis; for they are indispensable to human society and it is dangerous to link obedience to them with religious faith. If we attempt to assign the place of religion in the evolution of mankind, it appears not as a permanent acquisition but as a counterpart to the neurosis which individual civilized men have to go through in their passage from childhood to maturity.[1]

You are of course free to criticize this description of mine; I will even go halfway to meet you on this. What I told you about the gradual crumbling away of the religious *Weltanschauung* was certainly incomplete in its abbreviated form. The order of the different processes was not given quite correctly; the cooperation of various forces in the awakening of the scientific spirit was not followed. I also left out of account the alterations which took place in the religious *Weltanschauung* itself during the period of its undisputed sway and afterwards under the influence of growing criticism. Finally, I restricted my remarks, strictly
[169] speaking, to one single form taken by religion, that of the Western peoples. I constructed an anatomical model, so to speak, for the purpose of a hurried demonstration which was to be as impressive as possible. Let us leave on one side the question of whether my knowledge would in any case have been sufficient to do the thing better and more completely. I am aware that you can find everything I said to you said better elsewhere. Nothing in it is new. But let me express a conviction that the most careful working over of the material of the problems of religion would not shake our conclusions.

The struggle of the scientific spirit against the religious *Weltanschauung* is, as you know, not at an end: it is still going on today under our eyes. Though as a rule psychoanalysis makes little use of the weapon of controversy, I will not hold back from looking into this dispute. In doing so I may perhaps throw some further light on our attitude to *Weltanschauungen*. You will see how easily some of the arguments

1 [The possibility of society suffering from neuroses analogous to individual ones was mentioned by Freud in *The Future of an Illusion* (1927*c*), *RSE*, **21**, 40 f., and in *Civilization and its Discontents* (1930*a*), ibid., **21**, 130. He discussed it at much greater length in Essay III, Part I, Section C of *Moses and Monotheism* (1939*a*), ibid., **23**, 66 ff. The analogy between religious practices and obsessive actions had been pointed out much earlier (Freud, 1907*b*), ibid., **9**, 104–5.]

brought forward by the supporters of religion can be answered, though it is true that others may evade refutation.

The first objection we meet with is to the effect that it is an impertinence on the part of science to make religion a subject for its investigations, for religion is something sublime, superior to any operation of human understanding, something which may not be approached with hair-splitting criticisms. In other words, science is not qualified to judge religion: it is quite serviceable and estimable otherwise, so long as it keeps to its own sphere. But religion is not its sphere, and it has no business there. If we do not let ourselves be put off by this brusque repulse and enquire further what is the basis of this claim to a position exceptional among all human concerns, the reply we receive (if we are thought worthy of any reply) is that religion cannot be measured by human measurements, for it is of divine origin and was given us as a revelation by a Spirit which the human spirit cannot comprehend. One would have thought that there was nothing easier than the refutation of this argument: it is a clear case of *petitio principii*, of 'begging the question'[1] – I know of no good German equivalent expression. The actual question raised is whether there *is* a divine spirit and a revelation by it; and the matter is certainly not decided by saying that this question cannot be asked, since [170] the deity may not be put in question. The position here is what it occasionally is during the work of analysis. If a usually sensible patient rejects some particular suggestion on specially foolish grounds, this logical weakness is evidence of the existence of a specially strong motive for the denial – a motive which can only be of an affective nature, an emotional tie.

We may also be given another answer, in which a motive of this kind is openly admitted: religion may not be critically examined because it is the highest, most precious and most sublime thing that the human spirit has produced, because it gives expression to the deepest feelings and alone makes the world tolerable and life worthy of men. We need not reply by disputing this estimate of religion but by drawing attention to another matter. What we do is to emphasize the fact that what is in question is not in the least an invasion of the field of religion by the scientific spirit, but on the contrary an invasion by religion of the sphere of scientific thought. Whatever may be the value and importance of religion, it has no right in any way to restrict thought – no right, therefore, to exclude itself from having thought applied to it.

Scientific thinking does not differ in its nature from the normal

1 [In English in the original.]

activity of thought, which all of us, believers and unbelievers, employ in looking after our affairs in ordinary life. It has only developed certain features: it takes an interest in things even if they have no immediate, tangible use; it is concerned carefully to avoid individual factors and affective influences; it examines more strictly the trustworthiness of the sense perceptions on which it bases its conclusions; it provides itself with new perceptions which cannot be obtained by everyday means and it isolates the determinants of these new experiences in experiments which are deliberately varied. Its endeavour is to arrive at correspondence with reality – that is to say, with what exists outside us and independently of us and, as experience has taught us, is decisive for the fulfilment or disappointment of our wishes. This correspondence with the real external world we call 'truth'. It remains the aim of scientific work even if we leave the practical value of that work out of account. When, therefore, religion asserts that it can take the place of science,
[171] that, because it is beneficent and elevating, it must also be true, that is, in fact, an invasion which must be repulsed in the most general interest. It is asking a great deal of a person who has learnt to conduct his ordinary affairs in accordance with the rules of experience and with a regard to reality, to suggest that he shall hand over the care of what are precisely his most intimate interests to an agency which claims as its privilege freedom from the precepts of rational thinking. And as regards the protection which religion promises its believers, I think none of us would be so much as prepared to enter a motor car if its driver announced that he drove, unperturbed by traffic regulations, in accordance with the impulses of his soaring imagination.

The prohibition against thought issued by religion to assist in its self-preservation is also far from being free from danger either for the individual or for human society. Analytic experience has taught us that a prohibition like this, even if it is originally limited to a particular field, tends to widen out and thereafter to become the cause of severe inhibitions in the subject's conduct of life. This result may be observed, too, in the female sex, following from their being forbidden to have anything to do with their sexuality even in thought.[1] Biography is able to point to the damage done by the religious inhibition of thought in the life stories of nearly all eminent individuals in the past. On the other hand, intellect – or let us call it by the name that is familiar to us, reason – is among the powers which we may most expect to exercise a unifying influence on men – on men who are held together with such difficulty

1 [This had been considered in *The Future of an Illusion* (1927*c*), *RSE*, **21**, 45.]

and whom it is therefore scarcely possible to rule. It may be imagined how impossible human society would be, merely if everyone had his own multiplication table and his own private units of length and weight. Our best hope for the future is that intellect – the scientific spirit, reason – may in process of time establish a dictatorship in the mental life of man. The nature of reason is a guarantee that afterwards it will not fail to give man's emotional impulses and what is determined by them the position they deserve. But the common compulsion exercised by such a dominance of reason will prove to be the strongest uniting bond among men and lead the way to further unions. Whatever, like religion's pro- [172]
hibition against thought, opposes such a development is a danger for the future of mankind.

It may then be asked why religion does not put an end to this dispute which is so hopeless for it by frankly declaring: 'It is a fact that I cannot give you what is commonly called "truth"; if you want that, you must keep to science. But what I have to offer you is something incomparably more beautiful, more consoling and more uplifting than anything you could get from science. And because of that, I say to you that it is true in another, higher sense.' It is easy to find the answer to this. Religion cannot make this admission because it would involve its forfeiting all its influence on the mass of mankind. The ordinary man knows only one kind of truth, in the ordinary sense of the word. He cannot imagine what a higher or a highest truth may be. Truth seems to him no more capable of comparative degrees than death; and he cannot join in the leap from the beautiful to the true. Perhaps you will think as I do that he is right in this.

So the struggle is not at an end. The supporters of the religious *Weltanschauung* act upon the ancient dictum: the best defence is attack. 'What', they ask, 'is this science which presumes to disparage our religion – our religion which has brought salvation and consolation to millions of people over many thousands of years? What has it accomplished so far? What can we expect from it in the future? On its own admission it is incapable of bringing consolation and exaltation. Let us leave them on one side then, though that is no light renunciation. But what about its theories? Can it tell us how the universe came about and what fate lies before it? Can it even draw us a coherent picture of the universe, or show us where we are to look for the unexplained phenomena of life or how the forces of the mind are able to act upon inert matter? If it could do this we should not refuse it our respect. But none of these, no problem of this kind, has been solved by it hitherto. It gives

us fragments of alleged discovery, which it cannot bring into harmony with one another; it collects observations of uniformities in the course of events which it dignifies with the name of laws and submits to its risky interpretations. And consider the small degree of certainty which it attaches to its findings! Everything it teaches is only provisionally true:
[173] what is praised today as the highest wisdom will be rejected tomorrow and replaced by something else, though once more only tentatively. The latest error is then described as the truth. And for this truth we are to sacrifice our highest good!'

I expect, ladies and gentlemen, that, insofar as you yourselves are supporters of the scientific *Weltanschauung* which is attacked in these words, you will not be too profoundly shaken by this criticism. And here I should like to recall to you a remark that once went the rounds in Imperial Austria. The old gentleman[1] once shouted at the committee of a parliamentary party that was troublesome to him: 'This isn't ordinary opposition any more! It's *factious* opposition!' Similarly, as you will recognize, the reproaches against science for not having yet solved the problems of the world are exaggerated in an unjust and malicious manner; it has truly not had time enough yet for these great achievements. Science is very young – a human activity which developed late. Let us bear in mind, to select only a few dates, that only some three hundred years have passed since Kepler discovered the laws of planetary movement, that the life of Newton, who analysed light into the colours of the spectrum and laid down the theory of gravitation, ended in 1727 – that is to say, little more than two hundred years ago – and that Lavoisier discovered oxygen shortly before the French Revolution. The life of an individual is very short in comparison with the duration of human evolution; I may be a very old man today,[2] but nevertheless I was already alive when Darwin published his book on the origin of species. In the same year as that, 1859, Pierre Curie, the discoverer of radium, was born. And if you go further back, to the beginnings of exact science among the Greeks, to Archimedes, to Aristarchus of Samos (about 250 B.C.) who was the forerunner of Copernicus, or even to the first beginnings of astronomy among the Babylonians, you will have covered only a small fraction of the length of time which anthropologists require for the evolution of man from an apelike ancestral form, and which certainly comprises more than a hundred thousand years. And we must not forget that the last century has brought such a wealth of new discoveries, such

1 [The Emperor Franz Joseph was popularly so named.]

2 [Freud was 76 when he wrote this.]

a great acceleration of scientific advance that we have every reason to view the future of science with confidence. [174]

We must admit to some extent the correctness of the other criticisms. The path of science is indeed slow, hesitating, laborious. This fact cannot be denied or altered. No wonder the gentlemen in the other camp are dissatisfied. They are spoilt: revelation gave them an easier time. Progress in scientific work is just as it is in an analysis. We bring expectations with us into the work, but they must be forcibly held back. By observation, now at one point and now at another, we come upon something new; but to begin with the pieces do not fit together. We put forward conjectures, we construct hypotheses, which we withdraw if they are not confirmed, we need much patience and readiness for any eventuality, we renounce early convictions so as not to be led by them into overlooking unexpected factors, and in the end our whole expenditure of effort is rewarded, the scattered findings fit themselves together, we get an insight into a whole section of mental events, we have completed our task and now we are free for the next one. In analysis, however, we have to do without the assistance afforded to research by experiment.

Moreover, there is a good deal of exaggeration in this criticism of science. It is not true that it staggers blindly from one experiment to another, that it replaces one error with another. It works as a rule like a sculptor at his clay model, who tirelessly alters his rough sketch, adds to it and takes away from it, till he has arrived at what he feels is a satisfactory degree of resemblance to the object he sees or imagines. Besides, at least in the older and more mature sciences, there is even today a solid groundwork which is only modified and improved but no longer demolished. Things are not looking so bad in the business of science.

And what, finally, is the aim of these passionate disparagements of science? In spite of its present incompleteness and of the difficulties attaching to it, it remains indispensable to us and nothing can take its place. It is capable of undreamt-of improvements, whereas the religious *Weltanschauung* is not. This is complete in all essential respects; if it was a mistake, it must remain one for ever. No belittlement of science can in any way alter the fact that it is attempting to take account of our dependence on the real external world, while religion is an illusion and it derives its strength from its readiness to fit in with our wishful drive impulses.[1] [175]

1 [Freud's most elaborate evaluation of religion had been made in *The Future of an Illusion* (1927*c*), *RSE*, **21**, 5 ff.]

I am under an obligation to go on to consider other *Weltanschauungen* which are in opposition to the scientific one; but I do so unwillingly, for I know that I am not properly competent to judge them. So you must bear this proviso in mind in listening to the following remarks, and if your interest has been aroused you should seek better instruction elsewhere.

And here I must first mention the various systems of philosophy which have ventured to draw a picture of the world as it is reflected in the mind of thinkers who were for the most part turned away from the world. But I have already attempted to give a general account of the characteristics of philosophy and of its methods [p. 141 f. above] and I am probably as unqualified as few people have ever been to form an estimate of the different systems. So I will invite you to join me in turning to a consideration of two other phenomena which, particularly in our days, it is impossible to disregard.

The first of these *Weltanschauungen* is as it were a counterpart to political anarchism, and is perhaps a derivative of it. There have certainly been intellectual nihilists of this kind in the past, but just now the relativity theory of modern physics seems to have gone to their head. They start out from science, indeed, but they contrive to force it into self-abrogation, into suicide; they set it the task of getting itself out of the way by refuting its own claims. One often has an impression in this connection that this nihilism is only a temporary attitude which is to be retained until this task has been performed. Once science has been disposed of, the space vacated may be filled by some kind of mysticism or, indeed, by the old religious *Weltanschauung*. According to the anarchist theory there is no such thing as truth, no assured knowledge of the external world. What we give out as being scientific truth is only the product of our own needs as they are bound to find utterance under changing external conditions: once again, they are illusion. Fundamentally, we find only what we need and see only what we want to see. We [176] have no other possibility. Since the criterion of truth – correspondence with the external world – is absent, it is entirely a matter of indifference what opinions we adopt. All of them are equally true and equally false. And no-one has a right to accuse anyone else of error.

A person of an epistemological bent might find it tempting to follow the paths – the sophistries – by which the anarchists succeed in enticing such conclusions from science. No doubt we should come upon situations similar to those derived from the familiar paradox of the

Cretan who says that all Cretans are liars.[1] But I have neither the desire nor the capacity for going into this more deeply. All I can say is that the anarchist theory sounds wonderfully superior so long as it relates to opinions about abstract things: it breaks down with its first step into practical life. Now the actions of men are governed by their opinions, their knowledge; and it is the same scientific spirit that speculates about the structure of atoms or the origin of man and that plans the construction of a bridge capable of bearing a load. If what we believe were really a matter of indifference, if there were no such thing as knowledge distinguished among our opinions by corresponding to reality, we might build bridges just as well out of cardboard as out of stone, we might inject our patients with a decagram of morphine instead of a centigram, and might use tear-gas as a narcotic instead of ether. But even the intellectual anarchists would violently repudiate such practical applications of their theory.

The other opposition has to be taken far more seriously, and in this instance I feel the liveliest regret at the inadequacy of my information. I suspect that you know more about this business than I do and that you took up your position long ago in favour of Marxism or against it. Karl Marx's investigations into the economic structure of society and into the influence of different economic systems upon every department of human life have in our days acquired an undeniable authority. How far his views in detail are correct or go astray, I cannot of course tell. I understand that this is not an easy matter even for others better [177] instructed than I am. There are assertions contained in Marx's theory which have struck me as strange: such as that the development of forms of society is a process of natural history, or that the changes in social stratification arise from one another in the manner of a dialectical process. I am far from sure that I understand these assertions aright; nor do they sound to me 'materialistic' but, rather, like a precipitate of the obscure Hegelian philosophy in whose school Marx graduated. I do not know how I can shake off my lay opinion that the class structure of society goes back to the struggles which, from the beginning of history, took place between human hordes [*Menschenhorden*][2] only slightly differing from each other. Social distinctions, so I thought, were originally distinctions between clans or races. Victory was decided

1 [The simplest form of this paradox (known as the 'Epimenides') is provided by a man who says 'I am lying'. If he is lying, he is speaking the truth; and if he is speaking the truth, he is lying.]

2 [Freud uses the term 'horde' to mean comparatively *small* groups. Cf. *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 117.]

by psychological factors, such as the amount of constitutional aggressiveness, but also by the firmness of the organization within the horde, and by material factors, such as the possession of superior weapons. Living together in the same area, the victors became the masters and the vanquished the slaves. There is no sign to be seen in this of a natural law or of a conceptual [dialectical] evolution. On the other hand the influence exercised upon the social relations of mankind by progressive control over the forces of Nature is unmistakable. For men always put their newly acquired instruments of power at the service of their aggressiveness and use them against one another. The introduction of metals – bronze and iron – made an end to whole epochs of civilization and their social institutions. I really believe that it was gunpowder and firearms that abolished chivalry and aristocratic rule, and that the Russian despotism was already doomed before it lost the war, because no amount of inbreeding among the ruling families of Europe could have produced a race of tsars capable of withstanding the explosive force of dynamite.

It is possible, indeed, that with our present economic crisis, following after the Great War, we are only paying the price of our latest tremendous victory over Nature, the conquest of the air. That does not sound very illuminating, but the first links at least in the chain are clearly
[178] recognizable. English politics were based on the security which was guaranteed by the seas that washed her coasts. In the moment at which Blériot flew across the Channel in his aeroplane this protective isolation was breached; and in the night during which (in peacetime and on an exercise) a German Zeppelin cruised over London the war against Germany was no doubt a foregone conclusion.[1] Nor must the U-boat threat be forgotten in this connection.

I am almost ashamed to comment to you on a subject of such importance and complexity with these few inadequate remarks, and I know too that I have told you nothing that is new to you. I merely want to draw your attention to the fact that the relation of mankind to their control over Nature, from which they derive their weapons for fighting their fellow men, must necessarily also affect their economic arrangements. We seem to have come a long way from the problem of a *Weltanschauung*, but we shall very soon be back to it. The strength of Marxism clearly lies, not in its view of history or the prophecies of the future that are based on it, but in its sagacious indication of the decisive influence which the economic circumstances of men have upon their

1 I was told of this from trustworthy sources during the first year of the war.

intellectual, ethical and artistic attitudes. A number of connections and implications were thus uncovered, which had previously been almost totally overlooked. But it cannot be assumed that economic motives are the only ones that determine the behaviour of human beings in society. The undoubted fact that different individuals, races and nations behave differently under the same economic conditions is alone enough to show that economic motives are not the sole dominating factors. It is altogether incomprehensible how psychological factors can be overlooked where what is in question are the reactions of living human beings; for not only were these reactions concerned in establishing the economic conditions, but even under the domination of those conditions men can only bring their original drive impulses into play – their self-preservative drive, their aggressiveness, their need to be loved, their drive towards obtaining pleasure and avoiding unpleasure. In an earlier enquiry I also pointed out the important claims made by the superego, which represents tradition and the ideals of the past and will for a time resist the incentives of a new economic situation.[1] And finally we must [179] not forget that the mass of human beings who are subjected to economic necessities also undergo the process of cultural development – of civilization as other people may say[2] – which, though no doubt influenced by all the other factors, is certainly independent of them in its origin, being comparable to an organic process and very well able on its part to exercise an influence on the other factors.[3] It displaces drive aims and brings it about that people become antagonistic to what they had previously tolerated. Moreover, the progressive strengthening of the scientific spirit seems to form an essential part of it. If anyone were in a position to show in detail the way in which these different factors – the general inherited human disposition, its racial variations and its cultural transformations – inhibit and promote one another under the conditions of social rank, profession and earning capacity – if anyone were able to do this, he would have supplemented Marxism so that it was

1 [See above, p. 59 f.]

2 [Cf. the parallel passage in *Why War?* (1933*b*), p. 224 below, and Freud's sweeping comment on this verbal point in *The Future of an Illusion* (1927*c*), *RSE*, **21**, 6: 'I scorn to distinguish between culture and civilization.' See ibid., **24**, 74.]

3 [The notion of a 'process of civilization' was very much in Freud's mind at this time. He had discussed it at several points in *Civilization and its Discontents* (1930*a*) (see, for instance, ibid., **21**, 88 f., 109 f. and 125–7); and he mentioned it again in *Why War?* (1933*b*), p. 224 below. But the idea was closely linked with one of much longer standing – the hypothesis, namely, of *repression* as an organic process. He himself brought out the connection fully in the two long footnotes at the beginning and end of Chapter IV of *Civilization and its Discontents*, *RSE*, **21**, 90–1 *n.* and 95–6 *n.* 3. The history of this hypothesis, going back to the year 1897, is given in full in the Editors' Introduction to the last-named work, ibid., 56–7.]

made into a genuine social science. For sociology too, dealing as it does with the behaviour of people in society, cannot be anything but applied psychology. Strictly speaking, there are only two sciences: psychology, pure and applied, and natural science.

The newly achieved discovery of the far-reaching importance of economic relations brought with it a temptation not to leave alterations in them to the course of historical development but to put them into effect oneself by revolutionary action. Theoretical Marxism, as realized in
[180] Russian Bolshevism, has acquired the energy and the self-contained and exclusive character of a *Weltanschauung*, but at the same time an uncanny likeness to what it is fighting against. Though originally a portion of science and built up, in its implementation, upon science and technology, it has created a prohibition of thought which is just as ruthless as was that of religion in the past. Any critical examination of Marxist theory is forbidden, doubts of its correctness are punished in the same way as heresy was once punished by the Catholic Church. The writings of Marx have taken the place of the Bible and the Koran as a source of revelation, though they would seem to be no more free from contradictions and obscurities than those older sacred books.

And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the drive restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an afterlife, expected the arrival

of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand.

There is no doubt of how Bolshevism will reply to these objections. It will say that so long as men's nature has not yet been transformed it [181] is necessary to make use of the means which affect them today. It is impossible to do without compulsion in their education, without the prohibition of thought and without the employment of force to the point of bloodshed; and if the illusions were not awakened in them, they could not be brought to acquiesce in this compulsion. And we should be politely asked to say how things could be managed differently. This would defeat us. I could think of no advice to give. I should admit that the conditions of this experiment would have deterred me and those like me from undertaking it; but we are not the only people concerned. There are men of action, unshakeable in their convictions, inaccessible to doubt, without feeling for the sufferings of others if they stand in the way of their intentions. We have to thank men of this kind for the fact that the tremendous experiment of producing a new order of this kind is now actually being carried out in Russia. At a time when the great nations announce that they expect salvation only from the maintenance of Christian piety, the revolution in Russia – in spite of all its disagreeable details – seems nonetheless like the message of a better future. Unluckily neither our scepticism nor the fanatical faith of the other side gives a hint as to how the experiment will turn out. The future will tell us; perhaps it will show that the experiment was undertaken prematurely, that a sweeping alteration of the social order has little prospect of success until new discoveries have increased our control over the forces of Nature and so made easier the satisfaction of our needs. Only then perhaps may it become possible for a new social order not only to put an end to the material need of the masses but also to give a hearing to the cultural demands of the individual. Even then, to be sure, we shall still have to struggle for an incalculable time with the difficulties which the untameable character of human nature presents to every kind of social community.

Ladies and gentlemen, allow me in conclusion to sum up what I had to say of the relation of psychoanalysis to the question of a *Weltanschauung*. Psychoanalysis, in my opinion, is incapable of creating a *Weltanschauung* of its own. It does not need one; it is a part of science and can adhere to the scientific *Weltanschauung*. This, however, scarcely deserves such a grandiloquent title, for it is not all-comprehensive, it is too incomplete [182]

and makes no claim to being self-contained and to the construction of systems. Scientific thought is still very young among human beings; there are too many of the great problems which it has not yet been able to solve. A *Weltanschauung* erected upon science has, apart from its emphasis on the real external world, mainly negative traits, such as submission to the truth and rejection of illusions. Any of our fellow men who is dissatisfied with this state of things, who calls for more than this for his momentary consolation, may look for it where he can find it. We shall not grudge it him, we cannot help him, but nor can we on his account think differently.

CONTRIBUTIONS TO BULLITT'S *THOMAS WOODROW WILSON: A PSYCHOLOGICAL STUDY* (1967)

EDITORS' INTRODUCTION

CONTRIBUTIONS TO BULLITT'S *THOMAS WOODROW WILSON: A PSYCHOLOGICAL STUDY*

GERMAN EDITIONS

'Einleitung'

1932 Probable date of Freud's own final version.

1971 In J. Cremerius (ed.), *Neurose und Genialität: Psychoanalytische Biographien*, S. Fischer Verlag, Frankfurt, 27–34.

1987 *GW*, **Nachtr.**, 686–92.

2007 In S. Freud & W. C. Bullitt, *Thomas Woodrow Wilson: Der 28. Präsident der Vereinigten Staaten von Amerika (1913–1921): Eine psychoanalytische Studie* (ed. H. J. Wirth), Psychosozial-Verlag, Giessen, 17–23.

Untitled (draft of the opening chapter)

1931 Probable date of composition.

2006 '[Ohne Titel]: Ein bisher unbekannter Text', in *Neue Rundschau*, **117** (1), 9–26.

2009 '[Darstellung der Grundvoraussetzungen der Psychoanalyse]', in S. Freud, *Abriss der Psychoanalyse: Einführende Darstellungen*, Fischer Taschenbuch Verlag, Frankfurt, 285–305. (Enlarged edition.)

Draft of the Opening Chapter

2006 *J. Amer. Psychoanal. Assn.*, **54** (4), 1263–98. (Tr. Mark Solms.)

All previous editions of the 'Introduction' derive from a slightly inaccurate typescript version of the German manuscript. The present translation, based on the original handwritten manuscript, is a new one by Mark Solms. The translation of the untitled manuscript that became the opening chapter is a revised version of the one published in 2006. The translation of the manuscript entitled 'Wilson's "Breakdowns"', which has not been published before, is also by Mark Solms.

Much controversy has surrounded Freud's involvement in the 1966 biography of Thomas Woodrow Wilson published by an American journalist and diplomat, William C. Bullitt, with the senior authorship attributed to Freud. Although the book was published too late for potential inclusion in the *SE*, it was considered in the 'Addenda and Corrigenda' in Volume 24, which was published some years after the first 23 volumes (1974). The opinion expressed there was that, 'although quite clearly influenced by Freud's ideas, [it] does not appear to contain any written contribution by Freud, with the exception of an Introduction (Freud, 1966*b*) of which the German original is extant' (p. 466). This implies that future editions of Freud's *Complete Psychological Works* should include only the Introduction. Angela Richards (the Editor of *SE*, **24**) accordingly included only this in the supplementary volume of the *GW* (1987, edited in collaboration with Ilse Grubrich-Simitis).

The initial decision to exclude the remainder of the book from Freud's official *oeuvre* was based not only on internal evidence – specifically, the poor style and unlikely content of the main body of the work – but also on the lack of any original documents, apart from the German typescript version of the Introduction. However, a contradiction arises from the fact that, in this Introduction, the authorship of which was not disputed, Freud wrote: 'For the analytical part [of the book] we are both responsible in equal measure; it arose out of close cooperation, and we wrote it together.' The suspicion therefore remained that portions of the main body of the work were indeed attributable to Freud. Even Jones described it as a 'joint work', in which 'it is not hard to distinguish the analytical contributions of the one author from the political contributions of the other' (1957, 160).

This would have left the Editor of the *RSE* in something of a quandary, if it were not for the discovery by Paul Roazen in 2004 of original documents pertaining to the preparation of the book, deposited by Bullitt's daughter at the library of Yale University. These documents made it possible to disentangle from the web of revisions, additions and distortions that became the basis for the published book the three texts published here, for all of which there is a German original in Freud's own hand (see Grubrich-Simitis, 2006, 2008, 2009; Solms, 2006, 2008).

These documents also make it possible to reconstruct the nature of the collaboration between Bullitt and Freud with reasonable accuracy. The project apparently started in April, 1930, when Bullitt told Freud that he was planning to write a book about some of the statesmen he had known personally. According to Bullitt, Freud offered to co-author the chapter on Wilson. This led Bullitt to recast the project entirely, since 'to bury Freud on Wilson in a chapter of my book would be to produce an impossible monstrosity; the part would be greater than the whole' (Bullitt, 1966, vi). He therefore persuaded Freud to collaborate in a full-scale biography of Wilson. According to a memorandum by Bullitt, dated October 22, 1930, the respective contributions of the two authors were assigned as follows: 'An introduction to be signed by him: An introduction to be signed by me: A statement of the facts of Wilson's career to be signed by me: The analysis of Wilson to be signed by him and me jointly.'

There is little reason to doubt this account, which is consistent with what Freud himself later wrote in his Introduction (see p. 169 ff. below).

The 'Introduction'

The Yale documents reveal that the published version of the Introduction, supposedly based on Freud's German manuscript, differs in two crucial respects from what he had actually written. Firstly, and most importantly, in the original handwritten version, Freud had heavily crossed out precisely the sentence quoted above to the effect that 'for the analytical part we are both responsible'. This sentence remains intact, however, in two English typescript translations, corrected in Bullitt's handwriting, with the heading 'Introduction by Sigmund Freud' (also in Bullitt's handwriting). These translations formed the basis for a second German typescript (the version that was reprinted in the *GW*, **Nachtr.**) which carries no trace of Freud's hand. This second German typescript was then retranslated into English, and became the published (1966) version.

The original handwritten manuscript experienced a different fate.[1] It became the basis for a new German typescript which incorporated Freud's previous handwritten changes and contained further corrections in his own hand. In this version (the only authorizable typescript), which Bullitt chose not to publish, Freud substituted the following distinctly different alternative for the deleted sentence: 'For the analytical part, too, the bulk of the work and most of the conclusions are his [Bullitt's] own, but I added so many amendments and additions that I may carry joint responsibility for the result.' It is uncertain when Freud composed this revised sentence, but it seems most likely to have been in the spring of 1932, when (according to Bullitt, 1966, viii) Freud 'made textual changes and wrote a number of new passages to which I objected'.

Still other, presumably later (typescript) versions of the disputed sentence exist in the Yale documents; but the version quoted above is the only one that exists in a manuscript that may be attributed definitely to Freud, and it is therefore the one published here.

The second crucial difference between the published (German and English) versions of the Introduction and the actual, authorizable manuscript is this: in both the original handwritten version and the revised typescript German version with Freud's handwritten corrections, the text reads: 'I must commence my modest contribution to William C. Bullitt's psychological study of Thomas Woodrow Wilson with . . .'. In the second of the adulterated English typescripts mentioned above, the word 'modest' is deleted as well as the words 'William C. Bullitt', which are replaced (in Bullitt's handwriting) with the word 'this'. These changes were then carried over to the English and German typescript versions which were published. The implication is that Freud thought he was writing an introduction to a book by William C. Bullitt, but Bullitt wanted to create a different impression.

Draft of the Opening Chapter

Bullitt's October, 1930 memorandum concerning the assignment of contributions (quoted above) does not specify who would actually *write* the 'jointly signed' part of the book. It states only that 'we should go to work together on the analysis of Wilson'. The other documents in the collection suggest that the following procedure

1 It is noteworthy that the original version of the Introduction was written *before* the 'Analysis of Wilson', in late 1930 or early 1931. At that stage, of course, Freud had no idea what the final form of the book would be.

was followed. Bullitt collected literature on Wilson (which he shared with Freud) and composed the 'historical' chapters of the book. Freud held 'talks' with Bullitt, at least some of which were purely educational. On the basis of these talks, Bullitt then composed drafts of the 'analytical' chapters, which were submitted to Freud for review and revision. Although this 'analytical' part of the book was based on Freud's oral presentations to Bullitt, he evidently considered Bullitt to be the author of the work, and understood his role to be that of educator and quasi-editor.

Accordingly, when Bullitt submitted his first draft (of what was ultimately to become the first two chapters of the book) Freud responded: 'I am just through your manuscript . . . There is only one passage where you suddenly dive into deep analysis which I would like to see omitted. Now you ask for an appointment. My idea is you ought to have a short respite' (letter dated November 22, 1930). Freud's reference to '*your* manuscript' is consistent with a letter he wrote a few days later to Arnold Zweig concerning his involvement in the project: 'I am once again writing an Introduction for something someone else is doing. I must not say what it is, but it too is an analysis and at the same time very much a matter of contemporary interest, almost political' (letter dated December 7, 1930). Freud's impression that the Introduction was for 'something *someone else* is doing' is consistent with what he actually wrote in the Introduction, before Bullitt modified it. It is also consistent with the subsequent correspondence between Freud and Bullitt. For example, in a letter dated March 7, 1931, Bullitt states that he had a new idea about why Wilson had become a statesman and concluded: 'If you accept this interpretation, I should say that Wilson's choice of statesmanship would be one of the most interesting features of our work instead of one of the least interesting.' (Bullitt's analytic construction in this regard became a prominent part of the published book.)

The correspondence culminates in Freud's response to Bullitt's revised draft of the analytical chapters of the book, which Freud again repeatedly describes as 'yours':

> I have finished my task sooner than expected. While I have changed some things in the general part, and written down the whole thing in German, I found there was little that needed my interference, particularly when you turn to W. himself, and nothing at all from p. 142 onwards. In fact it is excellently done, and in reading it gives the strong impression as if it were also correct in its essence. Except my remarking that some analytic formulas are too often repeated,[1] and my dislike of one paragraph (Greek and Jewish-English), whose statements I find 'sweeping', I have nothing to object. I could now think of translating your whole text into English, but my time will not allow this as my full work will start in October again. When you come to Vienna we will engage a translator, whose work I control, while you help him understand some American peculiarities. By the

1 In an undated fragment of a letter to Bullitt, found among the papers at Yale, Freud remarks: 'The last contributions to Wilson were too short for an evaluation, I have to wait until a longer piece exists. [However] I noticed that the expression "libido that flows towards the father through the channel of passivity" recurs all too frequently.'

> end of the year everything could be done. I expect from this book a good effect on the public and for you yourself.
>
> (Letter dated September 30, 1931.)[1]

The draft that Freud returned with this letter was approximately 389 pages long, but only the first 55 typescript pages have survived, together with Freud's handwritten amendments and additions, as well as his suggestions for the following 86 pages. Among these amendments and additions is an original manuscript version of the 'general part', which, as Freud mentions above, he wrote out in German. This is the part that was evidently based on Freud's 'talks' with Bullitt, and which Freud translated into German while 'changing some things' in it. The manuscript formed the basis for the first chapter of the published book, whereafter the book 'turns to Wilson himself'. This manuscript is the second of the three texts published here.

Although it was clearly the product of joint work, this is the only self-standing portion of the 'analytical' part of the book for which an original handwritten version exists – apart from the smaller fragment described below (on Wilson's 'Breakdowns'). In other words, the version published here is the only intact product of the joint work between Freud and Bullitt that we can be sure Freud approved. The fact that he had a substantial hand in the *content* of this part is further attested to by the fact that it caused serious disagreements with Bullitt, which ultimately led to the suspension of their collaboration, in the spring of 1932. A comparison between Freud's manuscript version and the corresponding 'general part' of the published book suggests that the disagreements revolved around three main topics.

The first of them was castration anxiety. As can be seen from the editorial footnotes in the text published below, Bullitt systematically expunged this topic from the book – including from the description of the Oedipus complex, which must have been difficult for Freud to accept. The second theme was Freud's interpretation of Christianity (or Christ identification) in relation to homosexuality. This, too, was removed from the published chapter – which may well have been galling for Freud, since it was the most original part of his contribution. Bullitt's discomfort with this theme presumably derived, as he himself suggested in his Foreword, from the fact that he was 'a believing Christian' (p. viii). The third basis for disagreement introduces the last of the three documents selected for inclusion in the *RSE*.

'Wilson's "Breakdowns"'

Bullitt claimed in his Foreword that 'Freud wrote the first draft of portions of the manuscript and I wrote the first draft of other portions' (1966, vii). This is not supported by the documents discovered by Roazen: apart from one fragment, a short manuscript concerning Wilson's 'breakdowns', handwritten by Freud, there is no evidence that Freud wrote the first draft of any other part of the book.

Freud was concerned about the interpretation of Wilson's 'breakdowns' from the start. In the memorandum dated October 22, 1930 (cited above), Bullitt reports that Freud 'asked me for any facts I had as to Wilson's physical condition, saying "we must not attribute to psychological causes symptoms which may have a physical origin".' Bullitt therefore invited Freud to write this section: 'Please go ahead as fast

1 This entire correspondence was conducted in English.

as you can on the interpretation of his illnesses' (December 7, 1931). The result was the short manuscript published here, which, however, differs substantially from the corresponding passages in the published book.

In the manuscript version Freud writes: 'It is, of course, possible that [Wilson's illnesses] were organic affections – attributable to a constitutional weakness – and that psychical factors had no share, or only a small share, in them . . . They recurred throughout his entire life and in the end became confluent with severe, undoubtedly somatic diseases. The possibility cannot be excluded, therefore, that the illnesses were physical from the very start . . . [This question] is not unimportant for an understanding of Wilson'.

The equivalent passage in the published book starts with the following pregnant alteration: 'To discuss these "breakdowns" is of course not easy. It is, of course, possible, *though improbable*, that they were organic affections' (p. 80, emphasis added). Freud's medical opinion of Wilson's illnesses must have seemed to Bullitt like cold water poured on his entire 'psychoanalysis' of the President.

A remaining question is: why did Freud eventually relent to the publication of a version (we shall never know which version) of this highly problematical book? The most likely answer is to be found in Bullitt's Foreword: 'In 1938 the Nazis permitted Freud to leave Vienna. I met him at the railroad station in Paris, where I was then American Ambassador, and suggested that we might discuss our book once more after he was settled in London. I carried the manuscript to Freud and was delighted when he agreed to eliminate the additions he had written at the last minute, and we were both happy that he found no difficulty in agreeing on certain changes in the text . . . We then agreed that it would be courteous to refrain from publishing the book so long as the second Mrs Woodrow Wilson lived' (1966, viii). With a minimum of inference, it appears that Freud relented to Bullitt's entreaties, under extremely trying circumstances, due to the part Bullitt had played in saving his family from the Nazis. But this is no reason to include in the *RSE* anything other than the three manuscripts that really are attributable to Freud.

Ironically, considering the reception of the bowdlerized published version, the reader will observe that there is much to recommend the present work. This applies especially to Freud's draft of the opening chapter, which provides a wonderfully lucid account of the fundamental concepts of psychoanalysis circa 1931. Also of special interest is Freud's interpretation of a type of identification that might be applied to many practitioners of Christianity (priests, for example) besides the individual personality of Woodrow Wilson.

Note in proof: Professor Patrick Weil recently studied and commented upon allegedly new documentary material relevant to the collaboration between Freud and Bullitt. His conclusions were reported too late for consideration in this Editors' Introduction (see Weil, 2022).

ORIGINAL VERSION OF THE 'INTRODUCTION'

[c. 1932]

Usually, when an author undertakes to submit his opinion of an historical figure [*Person*][T] for publication, he does not neglect to assure his readers at the outset that he has taken care to keep himself impartial and free of affective bias – that he has worked *sine ira et studio*, as the beautiful classical phrase puts it. I must, however, commence my modest contribution to William C. Bullitt's[I] psychological study of Thomas Woodrow Wilson with the acknowledgement that I was unsympathetic to the shape of the American President from the beginning, as it rose above the horizon of Europeans, and that this aversion only increased over the years, the more we learnt about him and the more severely we suffered the consequences of his intervention in our destiny [*Schicksal*][T].

With increasing acquaintance it was not difficult to find good reasons to support this intuitive [*gefühlsmässige*] attitude. It is reported that Wilson, when recently elected as President, shook off one of the politicians who drew attention to his services in connection with the election, with the words: 'God ordained that I should be the next President of the United States. Neither you nor any other mortal could have prevented that.'[2] I do not know how I could avoid the conclusion that a man who is capable of taking the pretences of religion so literally, and who feels so assured of a special personal relationship with the deity, is not suited to dealing with other, ordinary children of men. As everyone knows, one of the hostile camps during the war sheltered a chosen darling of Providence [the German Kaiser]. It is most regrettable that a

1 [Freud's attribution of the study to Bullitt is replaced in the published version with the neutral attribution 'this psychological study' and the word 'modest' is struck out. See Editors' Introduction, p. 165 above.]

2 [English in the original. A footnote appended to an early transcription of Freud's manuscript, and the English translation of it, both of which are among the documents described in the Editors' Introduction, states that Bullitt verified this anecdote and identified the politician as William F. McCombs, Chairman of the Democratic National Committee. (In the published version, the identity of the politician was transposed into the main body of the Introduction.) The reference to Bullitt in the translation perhaps casts doubt on the supposition (in *GW*, **Nachtr.**, 683 *n.*) that he was the translator of Freud's original manuscript, as does Freud's suggestion to him (quoted in the Editors' Introduction) that they should jointly appoint a translator.]

second one later appeared on the other side. No-one gained from it, and it cannot have enhanced the reputation of the Almighty.

Another widely recognized peculiarity of the President, which he himself proclaimed, is chiefly to blame for the fact that we do not know where to begin with his personality, that we experience him, so to speak, as a foreign body in our midst. Through a long and arduous process of development we have learnt to draw a boundary around our mental [*seelische*][T] inner world in contradistinction to the real external world. We cannot get to know the latter except through observation, study and the accumulation of experience. It has not been easy for us to thus renounce the things that would have fulfilled our wishes and confirmed our illusions, but the effort has rewarded us, it has paved the way to an undreamt-of mastery over Nature. In recent times we have begun to apply the same procedure to the contents of our mental inner world, thereby placing even greater demands on our self-critical faculties and our respect for facts. We expect the same result in this field, too. The more comprehensive and accurate our knowledge of mental life has become, the more we are able to bridle and guide our drive impulses [*Triebregungen*][T].

Seele

Trieb, Regung

By contrast, Wilson repeatedly declared that mere facts meant nothing to him, that he valued nothing but human convictions and intentions. In consequence of this attitude it was natural for him to repel from his thoughts the facts of the real outer world, indeed to disavow [*verleugnen*][T] them, whenever they contradicted his expectations and wishes. He therefore also lacked any motivation to reduce his ignorance by taking account of the particular facts of a case. All that mattered to him were noble intentions. When he crossed the ocean to bring a just and lasting peace to war-torn Europe, this placed him in the lamentable position of the benefactor who would restore the eyesight of a patient but knows nothing of the structure of the eye and has neglected to learn the appropriate surgical procedures.

Verleugnung

This same way of thinking is apparently responsible for the fact that so much insincerity, unreliability and inclination to deny [*Verleugnung*] the truth are expressed in Wilson's dealings with others, which is always conspicuous in an idealist. The obligation to speak the truth must indeed be ethically grounded, but it is surely also based on respect for the facts.

I must also acknowledge that there was an intimate connection between Wilson's withdrawal from reality and his pious faith. Many details of his public activity almost produce the impression of the methods of Christian Science transferred [*übertragen*] on to politics.

God is good, illness is evil, illness stands in contradiction to the basic nature of God. Therefore, since God *exists*, illness does *not*, there is no illness. And who would expect a therapist of this orientation to take an interest in symptomatology and diagnostics?

I return now to the starting point of these remarks, to the confession of my antipathy to Wilson, in order to say something more in justification of it. We all know that we are not fully responsible for our actions. We undertake something in the service of certain intentions; then it becomes apparent that it has had consequences that we did not expect and probably could not have foreseen. In this way we frequently reap more criticism and disrepute, and occasionally more praise and honour, than we deserve. However, when someone brings about in almost every respect the opposite of what he sets out to achieve, as Wilson did, when he reveals himself to be the very antithesis of the power that 'always desires evil and always creates good',[1] when a claim to free the world of evil culminates only in a renewed demonstration of the danger that fanatics pose to public safety, then it is small wonder that feelings of mistrust of a kind that preclude sympathy develop in the beholder. To be sure, when I was prompted, under Bullitt's influence, to go more deeply into the life history of the President, this emotional disposition did not remain unaltered. A degree of sympathy developed, but of a special sort, sympathy blended with pity, such as one experiences when reading Cervantes, for his hero, the 'ingenious' knight de la Mancha.[2] And finally, when I measured the powers of the man against the enormity of the task he had assumed, this pity became so overpowering that it repelled every other impulse. Thus, after all, I can still ask the reader not to reject in advance the study that follows due to its admitted partiality; although it did not come into being without the participation of strong affects, these affects were nevertheless substantially tamed. And I can vouch the same for Bullitt, as whose collaborator I appear here.

Bullitt, who knew the President personally, who was in his service during his period of prominence, and was at that time devoted to him with all the enthusiasm of youth, is alone responsible for the historical part of this book, about Wilson's childhood and youth. For the analytical part, too, the bulk of the work and most of the conclusions are his own, but I added so many amendments and additions that I may carry joint responsibility for the result.[3]

1 [As Mephistopheles says of himself in *Faust*, Part I, Scene 3.]

2 [Miguel de Cervantes, *El Ingenioso Hidalgo Don Quijote de la Mancha*.]

3 [Replaced in the published version by an earlier draft of this sentence, which Freud had explicitly rejected: 'For the analytical part we are both responsible in equal measure; it arose out of close cooperation, and we wrote it together.' See Editors' Introduction, p. 164 above.]

A few further remarks by way of explanation and justification will not be out of place here. The reader may object that our text is introduced as a 'Psychological Study', when it has taken a psychoanalytic approach to its subject, and to this end uses psychoanalytical assumptions and technical terms without restriction. But this is not misrepresentation, designed perhaps to divert the hostile prejudices of the general public. On the contrary, this title is meant to convey in an unmistakable fashion the conviction that psychoanalysis is nothing but psychology, simply a part of it, and that one need not apologize for employing analytical methods in a psychological investigation aimed at elucidating deeper mental facts. It is most certainly inadmissible to make public the results of such a depth psychological investigation, to expose them to general curiosity, so long as the person concerned is still alive; it is highly unlikely that this would happen with his consent.[1] Therapeutic analyses are conducted between doctor and patient, they exclude the presence of a third person, and they are governed by the duty to protect confidentiality. However, when someone whose life and work are significant for his contemporaries and for posterity departs the land of the living, he falls prey to biography by common consent and the previous restrictions can no longer be upheld. The question of a period of biographic 'immunity' still needs to be considered, but it is very seldom raised; it also would not be easy to reach agreement about such a period and to enforce it. Thomas Woodrow Wilson died in 1924.

Finally we must counter the view that it is the secret purpose of this book to demonstrate that Wilson was a pathological character, that he was sick, in order to undermine his legacy in a roundabout way. No, that is not our intention, and even if it were, we would not achieve the suspected aim. For belief in a rigid framework of normality and a sharp demarcation between normality and pathology in mental life has long since been abandoned by our science. A refined approach to diagnosis has enabled us to recognize neuroses in all sorts of places where we least expected to find them; indeed it almost justifies the assertion that neurotic symptoms and characterological restrictions have to a certain extent become common to all members of a civilized community [*Kulturgemeinschaft*][T]. We even believe that we have gained insight into

Kultur

1 [This is perhaps a suitable place to insert an English translation of a remark that Freud (1912*j*) appended to Jones's 'Psychoanalyse Roosevelts' (*Zbl. Psychoanal.*, **2**, 676 *n.*), which was not included in the *SE*, but was reprinted in *GW*, **Nachtr.**, 767:

'We take this opportunity to stress that we do not in any way approve of the tendency to use psychoanalysis for purposes of intruding into private lives. – Editorial Office.']

the exigency that effected this result.[1] We have furthermore been compelled to recognize that the categories, normal vs. pathological, are just as inadequate for the assessment of mental processes as the earlier autocratic ones, good vs. bad. Only a minority of cases of mental disorder can be traced back to inflammatory processes or the introduction of foreign substances into the organism, and even then, the effect of these factors is not direct. In the majority of cases it is purely quantitative relations that determine the shift to pathological functioning, such as the effects exerted on certain parts of the mental apparatus by excessively strong stimuli, a greater or lesser supply of the substances manufactured by the body which are indispensable for the functioning of the nervous system, and by temporal disturbances – precocity or retardation along the developmental lines of life.[2] We rediscover these aetiological characteristics when, with the help of psychoanalysis, we study what now appears to us to be the elementary material of mental events. A relative strengthening of one of the many varieties of drive impulse which supply energy to mental life, a particular deepening of one of the identifications upon which character is typically built, an especially strong reaction-formation against an impulse which must be restrained; such quantitative relations decide the final form of the personality, stamp upon it a special disposition and guide its activity along a certain path.

In his characterization of the deceased Brutus, Shakespeare has Mark Antony say:

> the elements
> so mixed in him that Nature might stand up
> and say to all the world: 'This was a man.'[3]

Drawing upon [*In Anlehnung an*][T] these words of the poet we are tempted to assert that the elements of a mental constitution are always the same. What varies in the mixture is the proportionate relations of the elements, and – we add this – their accommodation in the different provinces of mental life and in different objects. We then judge the disposition of the individual according to certain criteria as being normal or pathological, or as exhibiting pathological features. But these criteria are by no means unambiguous, reliable and constant. They are

1 [Cf. *Civilization and its Discontents* (1930*a*), *RSE*, **21**.]

2 [This unusually organic account of psychopathological mechanisms may reflect Freud's concern that Bullitt would 'psychologize' Wilson's illnesses. See Editors' Introduction, p. 163 ff. above.]

3 [*Julius Caesar*, Act V, Scene 5.]

difficult to grasp scientifically, are at bottom only practical aids, and often are of conventional origin. In effect, 'normal' means merely average or close to the average, and our judgement as to whether or not a character trait or behaviour should be considered pathological is often determined by whether or not it is harmful – harmful to the individual or to the community of which he is a member. Despite the indefiniteness of these concepts and the uncertainty as to the foundations of such judgements, in practical life we cannot dispense with the distinction between normal and pathological, but we should not wonder at the fact that it does not coincide with other important antitheses.

Fools, dreamers [*Phantasten*], the deluded, severe neurotics and the mentally ill (in the psychiatric sense) have played a great part in the history of mankind throughout the ages, and not merely when an accident of birth has bequeathed sovereignty to them. Usually they have wreaked havoc, but not always. Such people exerted a far-reaching influence on their own and later times, they gave impetus to important cultural movements and made great findings and discoveries. Such achievements were on the one hand made possible by the intact portion of their personalities (therefore despite their pathology), but on the other hand it is often precisely the pathological features of their nature – the lopsidedness of their development, the abnormal strength of individual wishful impulses, the uncritical and uninhibited [*hemmungslose*][T] abandonment to a single aim – which give them the power to sweep others along with them, and to overcome the resistance of the outer world. Great achievement is so frequently accompanied by psychical abnormality that it is tempting to believe that the one is bound up with the other. But this is contradicted by the fact that in all fields of human accomplishment we also find great men who fulfil the requirements of normality.

Hemmung

With these remarks we hope we have allayed the suspicion that this book is anything other than a psychological study of Wilson. And yet we cannot deny – in this case as in all others – that a more intimate knowledge of the man would have led to a better evaluation of his efforts.

DRAFT OF THE OPENING CHAPTER[1]

[c. 1931]

Many books have been written about Thomas Woodrow Wilson, and many people close to him have tried to provide an explanation, for themselves and for others, of his nature. All these attempts at explanation have one thing in common: they end with a question mark. Wilson has remained a character full of contradiction, an enigma, even for his biographers and supporters. Colonel House[2] notes in his diary on June 10, 1919: 'I think I never knew a man whose general appearance changed so much from hour to hour. It is not the President's face alone that changes. He is one of the most difficult and complex characters that I have ever known. He is so contradictory that it is hard to pass judgment upon him.' Wilson's friends and biographers have all come to the same conclusion, more or less explicitly.

Wilson was certainly a complicated personality, and it will not be easy to find our way to the underlying principle that unifies the apparent contradictions in his nature. We do not want to entertain false hopes as we set out to subject his mental life to analysis. This analysis cannot be complete and entirely satisfactory, for we know nothing about many aspects of his life and person. In fact, what we do know about him seems less important than what we do not know. We could learn everything we would like to know about him if he were still alive, and if he were to submit to the rigours of psychoanalytic investigation. But he is no longer alive, so no-one will ever be able to learn those things. We have no prospect of ascertaining the crucial facts of his mental life, with all their details and the way they fit together, and so we also have no right to call our work a psychoanalysis of Wilson. It is a psychological study based on the material that is still available to us; we make no greater claim for it.

1 [This (untitled) manuscript corresponds roughly to the first chapter of the published book (pp. 35–49). The differences between the two versions of the chapter are too numerous to detail in full. Only the most significant ones are recorded in these footnotes.]

2 [Col. Edward M. House, friend and confidant of Wilson.]

On the other hand we also do not want to minimize the fact that we do know a good deal about many aspects of Wilson's life and character. Even if we cannot aspire to a complete analysis, our knowledge is sufficient to justify the hope of correctly inferring the main lines of his mental development. In addition to what we know of Wilson as an individual, we may also include what psychoanalysis has taught us generally about all children of men. Wilson was, after all, basically a human being like any other, subject to the same laws of mental development. Psychoanalytic research has shown the universal validity of these laws by investigating countless individual cases.

When we say this, we do not mean to claim that psychoanalysis has uncovered the ultimate secrets of human mental life. But it has, so to speak, opened the door to this inner life and permitted us to recognize certain things in the vicinity of the doorway, while other, deeper-lying things are still shrouded in darkness. It has also cast some light into this darkness, so we can discern the outlines of various things. Further effort will in all probability show us that we have not described their shape quite correctly. But that does not matter. Our expectation that the details of our current concepts will undergo revision need not keep us from employing them, for the present, just as they are. Our science is still very young. Newton's achievement was not invalidated by the later appearance of Einstein and his theory, and without Newton there probably would not have been an Einstein. We shall therefore employ some of the theorems that psychoanalysis has provided and asked us to accept, and we must review these definitions and assumptions as concisely as possible before addressing the psychological problem posed by Wilson's character.

Our starting point is that there is a force [*Kraft*][T] at work in human mental life from the very start, which we call *libido*, the energy of the sexual drive[I] [*Sexualtriebs*][T]. The question of its origin does not concern us here. It is, however, not superfluous to remark that the sexual drive, whose energy we have called libido, encompasses not only what the term generally refers to, but also far more. We consider it to be expressed in everything that is described by the ambiguous word 'love'. Its scope coincides roughly with Plato's concept of *Eros*. It would probably make things easier for outsiders if, instead of 'sexual drive' and 'sexuality', we used the terms 'Eros' and 'erotism', and defined 'libido' as the energy of Eros. But for particular reasons this did not happen in psychoanalysis, and we cannot change it now.

Trieb

1 [The remainder of this paragraph is deleted in the published book (p. 36).]

This libido must be accommodated somewhere. We assume that it 'cathects' ['*besetzt*'][T] certain regions and parts of our mental apparatus, somewhat as an electric charge attaches to a conductor, and that just like an electric charge it undergoes quantitative variations, and that in the resting state it produces a tension corresponding to this quantity, and presses for discharge. We assume further that it is continuously supplied and renewed from somatic sources. *Besetzung*

The libido is in the first instance accommodated in self-love, in *narcissism*. This is most apparent in the newborn infant whose interests are restricted to the activities and products of its own body – for whom the source of all pleasure [*Lustquellen*][T] is itself. The nursing infant does of course have the maternal breast as an object, but it is obliged to absorb this object into its ego [*Ich*][T] and treat it as if it were a part of itself. *Lust*

We contrast narcissism with *object love*. In rare cases, adults remain in a position analogous to the narcissism of the newborn infant. Such people strike us as monsters of egoism, incapable of loving anything but themselves. During the course of life, a portion of the libido is normally directed towards objects, but another part remains attached to the ego. Narcissism is the libido's original home, and it is also its most enduring one. The ratio of narcissistic and object libido can fluctuate within a wide range; the main portion of the libido may be invested in the ego or in objects, but no human being is entirely devoid of self-love.

Our second theorem is this: all human beings are double gendered, or bisexual. Every individual, whether male or female, is composed of both masculine and feminine elements. This fact is just as fundamental to psychoanalysis as, for instance, it is to chemistry that the elements oxygen, hydrogen, carbon, etc., are present in all organic molecules.[1] We need not provide the proof of this statement here, and we may also be spared a discussion of all the difficulties one encounters when one tries to ascribe psychological meanings to the terms 'male' and 'female', alongside their biological ones. Our proposition will seem more credible, however, if we recall that the same sexual organs occur in both the male and the female body, differing only in the extent of their maturation and in an alteration (or loss) of their function. Likewise, the male body has two totally useless mammary glands, its prostate gland corresponds to the uterus, and the penis is equivalent to the small clitoris of the female.

1 [The remainder of this paragraph is deleted in the published book (p. 37).]

When the primary phase of pure narcissism has been surpassed and object cathexes begin to play their role, there are three ways in which the libido may be accommodated, namely in narcissistic, masculine and feminine tendencies. We consider all tendencies that are characterized by passivity to be expressions of femininity – such as, above all, the need to be loved, but also the inclination to submit to others – which reaches its extreme form in masochism, in wanting to suffer pain at the hands of others. By contrast, we consider everything that is characterized by activity to be masculine: the need to love, to dominate others, and to subdue the outside world and alter it according to one's wishes. So we permit masculinity to be equated with activity and femininity with passivity.[1] The relative proportion of masculinity and femininity in our bisexual disposition appears to be constitutionally determined. The general rule here is that the ratio is determined by the manifest gender of the individual. When someone is equipped with organs which enable him to perform the masculine role in the sexual act, we may expect the degree of masculinity in his constitution and his behaviour to be greater than the degree of femininity; and the same applies in the case of female sexual activity. (The opposite applies in many classes of animals.) This rule, however, allows for numerous exceptions. Anatomical masculinity and psychological masculinity frequently do not coincide. It happens that males are born with so little masculinity and so much femininity that by far the greater amount of their libido is characterized by feminine tendencies; conversely, there are females who are endowed with so little femininity that they resemble males in every respect other than the anatomy of their genitals. How this happens, we do not know. Psychology must accept these facts; it need not explain them. Perhaps some day advances in endocrinology will solve the puzzle for us. Endogenous secretions, however, are not a subject for psychology. For the present, it suffices us to know that such things occur.

These extreme homosexuals are, in any event, quite rare.[2] In the majority of cases both masculinity and femininity are well developed in the individual. Innate masculinity may be stronger than femininity, or the latter stronger than the former. All possible degrees of difference in relative proportion are realized in the individual case.

If the extent of the innate femininity in a male exceeds that of his masculinity, this by no means indicates that he is now predestined to

1 [The remainder of this paragraph is deleted in the published book (p. 38).]

2 [This entire paragraph and the next one are deleted in the published book (p. 38).]

lead the life of a homosexual. His childhood experiences can still thrust his libido, as regards object choice, in the one direction or the other. He may become a homosexual, but he is equally likely to become a normal heterosexual. In the converse case, if his masculinity is stronger than his femininity, it is still not certain that his libido will opt for normal heterosexual object choice; under the influence of powerful childhood experiences he could still become a homosexual. A very masculine male can develop into a homosexual despite full preservation of his masculinity, in which case it is not the character of his gender [*Geschlechtscharakter*][T] but only that of his object that is changed. It must not be overlooked that even these two factors [gender identity and sexual orientation] do not stand in a clear and fixed relationship to each other. All that can be said is that the male who is equipped with more masculinity from the outset has a better chance of withstanding those childhood influences that could push his libido in the direction of homosexual object choice. A brother, on the other hand, in whom the opposite, the feminine predisposition is stronger, could easily find his way to a normal heterosexual life if childhood influences were favourable. All these many variations are insignificant in comparison with the fact that the libido, insofar as it has transcended narcissism, is divided between both masculine and feminine relations to objects.

Geschlecht

The first human objects encountered by the child are the mother and the father, or their substitutes. Initial relations with them are of a passive nature: the child is nurtured, caressed, guided by their instructions, and punished by them. The child's libido is therefore firstly directed towards these relationships. Then a reaction gradually sets in. The child wants to repay his parents for what they do to him; he wants to take an active role with them, to caress them, dominate them, and take revenge on them. Henceforward, his libido has four possible outlets: those of passivity towards father and mother and those of activity towards them. This situation provides the basis for the emergence of the Oedipus complex.

In order to explain the Oedipus complex we must introduce the third proposition of psychoanalytic theory, an assumption from drive theory. This theory states that two main drives are active in mental life: that of Eros – sexuality in the broadest sense – whose energy we have already described as libido; and another one that we call the 'death drive' in view of its ultimate goal, which is revealed to us in the form of aggressive and destructive impulses. The death drive is

the antagonist of Eros, which strives to produce ever greater unities held together by the libido. Both drives are present simultaneously in mental life from the start. However, we rarely, if ever, come across them in pure form; they are generally amalgamated in varying proportions.

What we perceive as masculinity and femininity never consists in libido alone; they are always accompanied by a certain admixture of aggression or destructiveness. We assume that this admixture is far greater in masculinity than in femininity, but it is not absent in the latter,[1] where it is directed inwards instead of outwards – against the person herself. An attempt to provide the evidence for this piece of psychoanalytic theory would lead us much too far afield. We must, however, warn the reader against succumbing to the inclination to simplify, and thereby to identify the contrast between masculinity and femininity with that between Eros and the death drive. To simplify is admirable, but truth should not be sacrificed to simplicity. The truth seems to be that the world is something very complicated.

We emphasize once more that every libidinal cathexis is accompanied by a piece of aggression – and we return again to the Oedipus complex. We shall, however, trace it in the male child only.[2] The Oedipus complex develops differently in girls. The difference lies in its relationship to the castration complex, about which we shall hear more soon. In boys, the Oedipus complex precedes the castration complex and is brought to an end by the fear of castration. In girls, the discovery that they have been castrated is the first step in a developmental process that culminates in the formation of the Oedipus complex.

We have seen that the libido of the young child has five pathways open to it: (1) that of narcissism; (2) that of passivity to the mother; (3) that of passivity towards the father; (4) that of activity (with aggression) towards the mother; (5) that of activity towards the father. The Oedipus complex now arises from conflicts between these various libidinal tendencies. Initially the child is not aware of any conflict; he derives satisfaction from all these tendencies and is not disturbed by the contradictions between them. Gradually, however, it becomes too difficult for him to reconcile his active inclinations towards the father and mother with his passive inclinations towards them, either because the intensity of the tendencies has increased, or because there is now a need to unify (synthesize) all these libidinal positions. It is particularly difficult for the

1 [The remainder of this paragraph is deleted in the published book (p. 39).]

2 [The remainder of this paragraph is deleted in the published book (p. 39).]

male child to combine his activity towards the mother with his passivity towards the father. If he wants to give full expression to his activity towards his mother, he finds the father in his way, for in reality it is the father, not he, who possesses the mother. He would like to direct his aggressive activity against the father, to remove him as an obstacle in relation to the mother, but he also wants to submit to the father in every respect. He cannot simultaneously possess the mother and remain passive towards the father. His desire to eliminate the father is incompatible with his passivity towards him. Libidinal expression in all of these attitudes is now inhibited. The child finds himself in conflict. And that is the Oedipus complex.

In the early stage of the development of the Oedipus complex the boy has as yet no knowledge of the anatomical difference between the sexes.[1] He differentiates the father and mother as personalities but not as sexual beings. He still thinks that all human beings possess a penis, as he himself does. We call this the phallic phase. But at some point before the age of three, he observes that the penis, which he had attributed to all people, is missing in some. Understandably he draws the conclusion that the woman is a man whose penis has been taken away – cut off. As a result, he is stricken with castration anxiety [*Kastrationsangst*][T]; he is afraid that his own penis will be taken away. (The little girl has meanwhile assumed to her horror that she, too, once had a penis that was cut off.) Psychoanalysis teaches that castration anxiety is always present, in nearly all human beings. It is something that scarcely anyone is spared. *Angst*

The first consequence of castration anxiety is an enormous intensification of the conflicts inherent in the Oedipus complex. There is a great increase in the strength of the current of the boy's libido in his active attitude towards the father; added to this, hostility and hatred stemming from the fear that the father is going to punish him by castrating him for coveting the mother now appear. The more pronounced the boy's masculinity, the stronger his hostility towards the father. In order to free himself from castration anxiety and secure his possession of the mother, the boy as a rule comes to wish his father dead, and because the father doesn't die, the wish to kill him is stirred.

On the other hand, the boy's active affectionate attitude towards the mother diminishes considerably, not only due to the danger of castration connected with the satisfaction of this libidinal current, but also because the mother as a castrated being has lost part of her attraction

1 [This entire paragraph and the following four (ending: '. . . some form of escape') are deleted in the published book (p. 39).]

for the boy – indeed she has even become an object of horror to him. This last factor also reduces the current of passive libido towards the mother. In this way, castration anxiety inevitably leads to the mother losing value as a libidinal object.

As the boy's libido turns from the mother to the father, the passive attitude towards the father intensifies greatly. The portion of the boy's libido that had been directed towards femininity, towards taking pleasure in being passive, towards the need to submit to the father, would presumably be fully satisfied if the boy's assumption were correct that castration turns a male into a female. The boy believes in this transformation. His passivity inclines him to want to accept castration – to become female, and in this way escape castration anxiety once and for all. The female that he wants to become is usually his own mother, whose place he takes with the father, substituting himself for her with the father. Thus, identification with the mother is established, and from this point on it is included as a permanent component of the boy's unconscious, where it is destined to play a major role in his subsequent life. Later we shall become acquainted with another mechanism that contributes to the formation of this identification with the mother. [p. 183 below.]

The influence of castration anxiety on the boy's active and passive tendencies forces upon him a struggle against both of the dilemmas that make up the Oedipus complex. He wants to kill his father and at the same time he wants to submit to him without reservation, even to the point of accepting the sacrifice of castration and transformation into a female. On the other hand, he wants to possess the mother as a lover, while at the same time he is repelled by her because she reminds him of the dreaded castration. The conflict eventually becomes so unbearable that the child is compelled to find some form of escape.

The resolution of the Oedipus complex is the most difficult task facing human children in their psychic development. For boys the effect of castration anxiety[1] is that the greater part of their libido is directed away from the mother, towards the father. So the main problem is the incompatibility of two drive impulses, namely to kill the father and to submit to him unreservedly, both of which he passionately desires. A secondary problem is the irreconcilability of his erotic desire for his mother with the horror she awakens in him.

Identifying with the father is a technique practised by all male children, to free themselves from the main problem connected with the

1 [The reference here to castration anxiety is deleted in the published book (p. 40).]

Oedipus complex. Equally unable to kill the father or to submit to him, the child finds a way out which is similar to eliminating the father yet at the same time avoids killing him. He identifies with the father. This satisfies both his loving and his hostile impulses. Not only has he given expression to his love and admiration for the father, he has also eliminated him by incorporating him, as though by an act of cannibalism. Now he himself is the great, admired father.

This step of identifying with the father also explains the boy's urge to surpass him, to be greater than the father – a desire which so often dominates the life of a growing boy. To be sure, the father with whom the little boy identifies is not the father as he really is, and as his son will later recognize him to be, but rather a father whose power and merits have become extraordinarily exaggerated while his weaknesses and faults have been disavowed [*verleugnet*]. He is the father as he appears to the little child. In later years, measured against this ideal figure, the real father inevitably falls short; and when the youth wants to surpass the father, he is really only turning from the father of his present experience back to the father figure of his childhood. As a result of incorporating his father, the all-mighty, all-wise, all-benevolent father of the child's early years becomes an internal mental agency, which in psychoanalysis we refer to as the ego ideal or as the 'superego' [*Über-ich*][T]. The superego is manifested throughout life in the form of commands and prohibitions. Its negative, prohibiting function is known to us all as conscience; its other, positive, authoritative side, although perhaps less easily perceptible, is certainly even more influential. It is expressed in everything a person strives for, consciously as well as unconsciously. In this way identification with the father evolves from the boy's unsatisfied desire to kill him; and from this identification in turn, the ego ideal and superego evolve.

The establishment of the superego does not, of course, resolve all the difficulties associated with the Oedipus complex, but it does accommodate a certain portion of the libidinal current that originally took the form of activity towards the father. However, it also becomes the source of new difficulties with which the ego has to struggle. For the superego will, for the remainder of one's life, admonish, censure, repress [*verdrängen*][T], and attempt to stem and divert from their aims, all libidinal wishful impulses which (in their original form) do not meet the demands of the superego. For many people this struggle between the libido in the ego and the superego does not turn out too badly, either because the libido is weak and easily controlled by the superego, or

Verdrängung

because the superego is so weak that it must tolerate the libido going its own way, or finally, because the demands of the superego do not greatly exceed what human nature is capable of, so that it no longer expects more of the libido than the latter is able to provide. A superego like this is very comfortable for the person who possesses it, but it has the disadvantage of allowing nothing more than a quite ordinary person to develop. A superego that does not demand much from the libido will not obtain much from it; the person who does not expect much of himself will not accomplish much either.

At the other end of the spectrum is the superego whose demands are so grandiose [*grossartig*] that it continually exacts what is virtually impossible from the ego. A superego like this sometimes produces great men, along with many psychotics and neurotics. The manner in which such a superego comes about is no mystery. We know that every child's imagination [*Vorstellung*][T] exaggerates the father's greatness and power, but in some cases this exaggeration is so extreme that the father, with whom the child identifies and who provides the material from which his superego is constructed, is equated with the Almighty, with God-the-Father Himself. In this case the superego literally demands the impossible from the ego. Nothing the ego achieves in life satisfies the superego. It admonishes the ego incessantly: 'You must make the impossible possible. You can do it. You are your father's beloved son, you are the father himself, you are God'. Such extremes on the part of the superego are not rare; psychoanalysis confirms that identifying the father with God is a normal, if not usual, occurrence in mental life. And if the son identifies with the father, and then identifies the father with God, and sets up this father image as his superego, then the son feels that he has God within himself, that he himself has become God. Then everything he does has to be right because it is God Himself who has done it. The amount of libido invested in the identification with God is so large in some people that they lose the ability to acknowledge those facts of the external world that are inconsistent with it. Then they end up in an asylum. To be sure, a man whose superego is based on this kind of identification, and who has retained full respect for reality, can, if he has the ability, achieve great things in the world. His superego has demanded much and received much in return.

Naturally, it is one of the major tasks for every human being to come to terms with the world of reality. This is no easy task for the child. None of the tendencies of his libido can be fully satisfied in reality. He cannot kill his father; he cannot possess his mother. It is impossible for

him to submit completely to his mother; it is just as impossible to submit completely to his father and become his wife by means of castration. The child cannot be almighty like God. Somehow or other all these contradictory desires must be reconciled, not only with one another but also with the realities of life. Every human being in the world must achieve this reconciliation. Those who completely fail in the task will succumb to psychosis, to madness. Those who attain only a partial, and thus unstable, balance among the conflicting demands will become neurotic. Only someone who succeeds in attaining a perfect balance will become a healthy, normal person. It must be added, though, that only rarely will healthy people be able to reconcile these conflicts so successfully that the balance achieved would not break down under the pressure of external difficulties. We are justified in saying that all human beings are more or less neurotic. Nevertheless, for many people the balance is so firmly established that they can endure great misfortune without becoming neurotic; for others it takes very little misfortune for them to develop neurotic symptoms. We may say, in conclusion, that every human ego is the resultant of the effort to reach a balance among all of these conflicts: the conflicts between different libidinal tendencies, and the conflicts between the libido and the demands of the superego as well as those of the real external world. The kind of balance ultimately achieved depends, on the one hand, on the extent of the innate masculinity and femininity, and, on the other hand, on the impressions received by the human being in childhood. The outcome of this attempt to establish a balance is what we call the 'character' of the ego.

The ego's task of reconciling the demands of the libido with the commands of the superego and with the conditions imposed on it by the external world is, as we have said, not an easy one. All the demands of the drives must somehow be dealt with; the superego insists on its demands; and reality cannot be evaded. If it is impossible to fully satisfy the libido, then three mechanisms, which we shall now turn to, are available to complete the task: repression, identification and sublimation. *Repression* consists in disavowing[1] the demand of the drive that craves satisfaction, treating it as if it doesn't exist, leaving it in the unconscious and forgetting about it. *Identification* seeks to satisfy the wish of the drive by transforming the ego itself into the desired object, so that it becomes both at the same time: the desiring subject and the desired object. *Sublimation* uses the method of satisfying the wish of the

1 ['*zu verleugnen*'; the term is here evidently not used in the usual technical sense.]

drive at least partially, by substituting its unattainable object for another one that has nothing to fear from the reaction of the superego or from external circumstances. In this way the wish is displaced from a highly satisfying but inadmissible aim or object to a perhaps less satisfying but more readily attainable one.

Repression is the most impractical of these methods for achieving the sought-after resolution of conflict, because it is impossible in the long run to disregard the demands of a drive. The pressure from the libido eventually becomes too strong. The repression fails, and the libido breaks through. The intensity of the libido is greatly increased by repression, for it not only has been cut off from any possibility of discharge [*Abfuhr*]^{T} but also has been deprived of the moderating influence of reason, which takes reality into account. Behind the dam that repression has built, pressure from the libido grows, making an irruption inevitable. But repression succeeds insofar as the libido does not attain its original object, but rather must strike out on new paths and become attached to another object.

abführen

For example, a boy who completely represses his hostility towards the father shall for that reason not be freed of the wish to kill him. On the contrary, behind the dam of repression, aggressive activity towards the father builds up until the pressure becomes too great for the dam. The repression breaks down, and the hostility towards the father bursts through, acting either against the father himself or against persons who can be substituted for him, who somehow resemble him, and so on. If a neurosis develops, the child will displace [*verschiebt*]^{T} his relationship with the father on to an animal, and will display symptoms of the corresponding phobia.

Verschiebung

Hostility towards the father is unavoidable for the boy insofar as he lays claims to masculinity. If a male has completely repressed this drive impulse in his childhood, he will surely lapse into hostile relations with father representatives in later life. He will manifest this hostility even when those in question do not deserve it, but incur it for no other reason than that they in some way remind him of his father. In this case, the cause of his hostility lies completely within himself, there is virtually no external reason for it. But if it should happen that he does have real grounds for his hostility, then his emotional reaction will be excessive and far out of proportion to the real situation. Such a person will find it generally difficult to maintain friendly relations with other men of equal status, power and ability; and he will find it utterly impossible to

get along with those who are superior to him in these respects. He is compelled to hate them.

We cannot leave the subject of repression without mentioning the technique used by the ego to reinforce individual acts of repression. To do this the ego creates what we call 'reaction-formations', usually by strengthening impulses that stand in an opposite relation to those that are to be repressed. Thus, for example, repression of an initial predilection for dirt (originally for one's own faeces) is replaced by a strong tendency towards over-cleanliness, or by an aesthetic attitude in general. The tendency to repress passivity towards the father may result in an overemphasis on masculinity, which is then expressed in the arrogant rejection of any father substitute. Human mental life is a very complicated thing. Reaction-formations against repressed drive impulses play no less a role in character formation than do the two early identifications with the father and with the mother.

The method called *identification*, which the ego employs to satisfy the demands of the drive, is a very useful method and it is frequently applied. We have already traced the process by which aggressive activity towards the father leads to father identification and the creation of the superego, and by which passivity towards the father becomes mother identification. But everyone uses countless other forms of identification every day. It can be observed how a child whose kitten has been taken away compensates for the loss of this object by identifying with the kitten, with the way it meows, crawls around and eats from the floor. If a child is accustomed to have his father carry him on his shoulders (to playing 'horsey'), and the father is away for a long time, the child may put a doll on his own shoulders and carry it as his father carried him, now playing the role of the father. A man who has lost the woman he loves may attempt, until he finds a new love, to substitute his own self for the lost love object. (We shall come upon an instructive example of this kind in Wilson's life.)[1] A man whose passivity towards his father could not find a direct outlet will often have recourse to a double identification. He will identify with his father and he will seek out a younger man whom he identifies with himself, and on whom he bestows the same love that he wished for from his father, but which remained unsatisfied due to his passivity towards him. In this way he may become an active homosexual.

1 [Many of the mechanisms described and examples used in this 'general part' (which can easily be traced to other works by Freud) silently laid foundations for the 'analysis' of Wilson that was to follow.]

In many cases a man whose passive attitude towards the father has not found direct expression will find that expression by identifying with Jesus Christ. This identification is a regular occurrence in the mental life of a Christian; according to psychoanalytic evidence, it can be demonstrated in completely normal people.[1] That should not surprise us, for this identification accomplishes the feat of miraculously reconciling two extremely powerful and absolutely contradictory wishes, by fulfilling them both at the same time. The two wishes are: to be completely passive and subservient towards the father, that is, to be completely feminine, and on the other hand to be completely masculine, powerful and authoritative, like the father himself. Christ was able to fulfil both these wishes. By humbly submitting to the will of God-the-Father He was able to become God Himself; by surrendering to total femininity He was able to attain the ultimate aim of masculinity. It is therefore understandable that identification with Christ is so frequently used to deal with the more important of the two Oedipal problems – the relationship with the father.

It is probably no accident that with the world-wide spread of Christianity during the first centuries after the birth of Christ, an extraordinary decline in the direct expression of homosexuality occurred, which coincided with its official suppression. Its direct expression had simply become unnecessary. Identifying with Christ expressed homosexuality in a manner that not only attained social approval but also must have been acceptable to the superego, which always strives to resemble God. Christ is, after all, the perfect reconciliation between masculinity and femininity. Belief in His divinity includes the belief that one can realize the wildest dreams of activity by means of the utmost passivity; by submitting unreservedly to the father, one triumphs over him, and becomes God oneself. This mechanism of reconciling the opposing impulses of masculinity in the constitutionally bisexual human being, by identifying with Christ, is something so satisfying that it assures the Christian religion a long existence. People will not readily give up something that rescues them from the most difficult conflict they have to grapple with. They will continue to identify with Christ for a long time to come.

There is yet another way to take care of the father problem inherent in the Oedipus complex once and for all, a way that involves a double identification. When the boy has become a man and has had a son of his own, he will identify this son with himself as a child, and identify

1 [The remainder of this paragraph and the whole of the next one are deleted in the published book (p. 45).]

himself with his own father. His passivity towards his father is now expressed in his relationship with his son; he gives his son the love he had once craved from his own father. This resolution of the Oedipus complex is the only normal one provided by Nature, but it requires having a son. The working out of one's passivity towards the father is thus added to all the other motives for wanting a son.

We have already explained how passivity to the father results in identification with the mother. Now we must mention a strengthening of this identification, which takes place when the Oedipus complex dissolves, and the boy gives up his mother as a love object. One part of his active as well as his passive attitude to the mother is preserved by the boy's displacing both attitudes on to other women; but another part is not satisfied by this substitution, and identification ensues. In accordance with the mechanism with which we are now familiar, the child compensates for the loss of the mother by identifying with her. In the course of his life, he will then bestow on other men who take the place of the child he once was more or less of the measure of love that he as a child had craved from the mother.

The third method used by the ego to reconcile its conflicts is *sublimation*, which, as we have said, replaces the libido's original aims with others of which neither the superego nor society disapproves. As far as objects are concerned, the same goal is attained through the process of displacement. This is the case when a boy, who after all cannot possess his mother, directs his libido away from her towards his sisters, if he has any, and then towards his cousins or his sisters' girlfriends, and finally from them towards unrelated women with whom he falls in love – until this road leads him to the woman he marries. The greater the woman's similarity to his mother, the more abundant the libidinal current directed towards his marriage can be, and the more satisfaction he will find in it. But just as many causes for disagreement are also present in this new mother relationship.

The number of sublimations that occur in people's libidinal investments is truly countless. We have these sublimations to thank for all the higher achievements of our culture; all art and literature, for example, serve to create an outlet for some unsatisfied libidinal tendency or other; even scientific research is born of the child's early curiosity concerning his parents' genitals. Human society itself is held together by sublimated homosexual libido, for the passivity of boys towards their fathers is later transformed into a love of their fellow men, which serves society. If human bisexuality necessarily appears at times to be a heavy burden,

and the source of endless difficulties, then we must not forget that without it human society could not exist at all. If men displayed nothing but aggressive activity and women nothing but passivity, the human race would have become extinct long before the dawn of historical times, because the men would all have murdered one another. It is homosexuality – although not in its manifest form but rather in its sublimations – that ensures the continuation of a community of men, and that will perhaps succeed one day in uniting all the races of humanity in one great brotherhood.

Before ending this presentation of the basic presuppositions of psychoanalysis, it may be useful to mention some additional findings.

Anything that prevents the draining away of libido creates a damming up and increases pressure in the affected area – pressure that can then spread to other areas. The libido will press for discharge. Damming of the libido is not tolerated for long above a certain level. We can compare the libido to a stream of water flowing from a high mountain reservoir, fed by sources that never dry up – a stream that then divides into a number of channels. This analogy is useful as it reminds us of the libido's characteristic demand for discharge, and also illustrates the possibility of communication between its various channels. The comparison is also inadequate, however, because it does not sufficiently emphasize that the libido can remain in a resting state, in the form of a cathexis at a certain level.

The intensity of the libido – or we should say, from our point of view, its quantity – varies widely from person to person. Some have an extraordinarily powerful libido, others only a very weak one. Or to use our metaphor again: in some the reservoir on the mountain is a large lake, in others a small pool.

The libido will always abandon the channel it flows into when a new one, closer to its source, opens up – provided that the opposition from the ego and the external world is not greater in the case of the new one. It will also be prepared to relinquish a vehicle of sublimation if it can establish another one that is more satisfying.

In childhood, the discovery of gender differences led to castration anxiety[1] with all its consequences. There is another childhood experience, second in importance only to this one, and that is the birth of another child. When confronted with the arrival of a little brother, a boy generally reacts in a specific way: he feels betrayed by the father and the mother, because both of his wishes – to have a child with the mother and to bear a child for the father – have now been disappointed. The fact that

1 [The reference here to castration anxiety is deleted in the published book (p. 48).]

a child has arrived through intercourse between the father and mother, but without any consideration of his own fervent wishes, drives him to feelings of intense hostility towards both parents, hostility that can culminate in wishing them both dead. The reproach for having been betrayed by his parents, and the hatred, can then be transferred, wholly or in part, on to the younger brother. A child who is developing normally will free himself of the hatred by means of a typical identification. He becomes the [new] child's father and puts the younger brother in his own place. But in less normal cases the reproach of betrayal remains attached to the brother, and for the rest of his life the older boy will be suspiciously on the look-out, to see if the friends who later take the place of the younger brother act towards him in ways that repeat the earlier betrayal.

In the case just described, the feeling of having been betrayed is based on the disappointment of active as well as passive libidinal impulses. But something much more serious can result from passive homosexuality. Its repression drives many people into the persecutory form of paranoia, into delusions of persecution. As a rule, the patient at first believes that he is being persecuted and betrayed by the person he has loved most. The delusions of betrayal and persecution often have no factual basis whatsoever; they express the need to break free from the loved person who has not gratified the passive homosexuality of the patient. If the patient can assume that the person he loves so ardently is betraying and persecuting him, then he may replace love with hate, and is thus freed of the love. All cases of unjustified mistrust and delusions of persecution can easily be traced back to repressed homosexuality. People who cannot be called insane also make use of this same mechanism to keep their passive homosexuality from getting out of hand. Whenever we come across a man who is inclined to believe that his closest friends want to betray him, we may assume that his suspicions are a sign that he is protecting himself against passive homosexual feelings. If a friend can in any way be seen as a representative of the original betrayer, namely the younger brother, this defence against homosexuality will obviously have an easier time of it. Fortunately it is difficult for halfway normal people to be compelled to turn from the facts of real life to imagined facts; this occurs only in those unfortunate individuals whose passive homosexuality is excessive.

It is perhaps a general law, but in any case a frequent occurrence, that one directs a considerable amount of hatred towards a person one loves with particular intensity. When this occurs, one or the other of the

opposing emotions is wholly or partly forced into the unconscious. We call this the fact or principle of 'ambivalence'.

Frustrations and misfortunes of every kind have the effect of forcing the libido back into its previous positions – for example, of reversing sublimations to their original wishful cathexes. This is what we call 'regression'.

In the course of a human life it can happen that mental development comes to a sudden standstill and terminates at some point. An overwhelming event has forced the libido into positions which are then clung to until death, or until mental collapse, occurs. This is the definition of 'fixation' [*Fixierung*][T].

NOTE ON WILSON'S 'BREAKDOWNS'[1]

[c. 1931]

A discussion of those of Wilson's illnesses that were known as his 'break-downs'[2] is no easy task, and may not lead to any definite conclusions. It is of course possible that these were organic affections – attributable to a constitutional weakness – and that psychical factors had no share, or only a small share, in them. The first attack of this sort occurred during his seventeenth and eighteenth years, in 1874–5; but they recurred throughout his entire life and in the end became confluent with severe, undoubtedly somatic diseases. The possibility cannot be excluded, therefore, that the illnesses were physical from the very start. The absence of any material that might provide an answer to this question, which is not unimportant for an understanding of Wilson, is most regrettable.

The purely medical remarks that follow would have no place at all here if they did not promise at least to cast light on an obscure point in the history of Wilson's youth. If any young man of seventeen or eighteen years consults a physician complaining of states of general nervousness, headaches and dyspepsia, which periodically become so severe that they make it completely impossible to work and cause him to feel seriously ill, the physician would have immediate suspicions which he would seek to confirm through questions and investigations. He would associate the disturbances with a process that puberty can bring about in the male, and he will be reminded of many similar cases in his practice, in which the same clinical picture – general nervousness (fatigue, irritability, inability to work), persistent headache, indigestion and constipation – in which the certain aetiology was excessive masturbation or overabundant nocturnal pollutions. The physician would describe the clinical picture as a convincing and true case of neurasthenia, and provide a generally favourable prognosis. So long as he did not concern himself with the psychical situation of the

1 [This paper was reduced to little more than a paragraph in the published book (p. 80).]

2 [In English in the original.]

patient, however, he would not be able to predict whether or not he would remain what is loosely termed 'a neurasthenic' for the whole of his life.

Masturbation – that is, achieving sexual satisfaction by stimulating the genitals without involving a second person, usually under the arousing influence of sexually exciting thoughts [*Vorstellungen*][T] – has a bad reputation, still today, among both young and old. In times gone by, even the physicians blamed various serious conditions on this depraved habit, and painted repellent pictures of its ruinous consequences. Modern medicine has withdrawn these suspicions. We now believe that self-satisfaction is an extremely common, almost normative, generally harmless process, which, even in excess, causes nothing worse than a certain reduction in potency, and precisely the symptoms of neurasthenia. Even this degree of harm does not occur in all cases. We have no way of identifying the cases in which it is likely to have damaging effects. Many people tolerate even excessive masturbation without any negative consequences; so we have also come to the view that a tendency to compulsive [*intensive betriebener*] and protracted masturbation is evidence only that the person in question is disposed to disorders of sexual development.

It is naturally neither biologically nor socially desirable that self-satisfaction should persist for long after puberty. Sexual need is, after all, expected to become the root of the strongest bonds between members of human society. By grossly exaggerating the inferiority of self-satisfaction in our culture, and branding it as a serious offence among the youth, we ensure that the next generation will associate all their feelings of guilt with this form of sexual activity which can, nevertheless, scarcely be avoided under civilized conditions. But this link [between masturbation and guilt] is easier to understand if one recalls that masturbation is, at bottom, nothing but the executive agency of outlawed infantile sexuality.

There is no reason to suppose that even the young Thomas Wilson would have been spared the developmental difficulties of puberty. Anyone who cannot bring himself to imagine the future President of the USA, and future saviour of the world, in the situation of a masturbator, is free to believe that his nervous symptoms were caused or accompanied by excessive nocturnal ejaculations (wet dreams[I]). Feelings of guilt cannot be attached to these completely involuntary discharges, since they cannot be characterized as actions and do not

1 [In English in the original.]

give rise to conflicts regarding submission to one's desires. And yet they carry the same aetiological significance as masturbation and they give rise to the same illnesses.[1]

In 1876 Wilson wrote to his father that he had 'found his mind',[2] meaning that he had discovered that he had a good 'mind', that he had attained confidence in his intellectual [*geistigen*] faculties. This discovery was made after an extended period of illness and inability to work, and it led directly to Wilson's decision to become, not a clergyman ('minister'),[2] but a statesman. In making this decision he escaped – apparently for the first time – the overwhelming influence of the father, and achieved a certain degree of independence. It is hard to believe that a young man, 20 years old, would think and write like this if he had not been in a muddle for a good length of time already, if he had not doubted his intellect or feared that his intellectual capacities were impaired. We are reminded that such fears feature prominently among the predictable consequences of the sexual turmoil of this period of youth. It may therefore well have been the case that Wilson's development took a favourable turn at this point, that the pollutions settled or that he mastered his masturbatory tendencies, with the result that his headaches receded and his capacity for intellectual work was enhanced. We also know that a young person gains enormously in self-confidence when he is able, through force of will, to suppress masturbation. These possibilities are not contradicted by the fact that Wilson's neurasthenic symptom complex persisted, and resurfaced repeatedly in response to difficult situations.

1 [The following paragraph appears to have been written at a later date than the rest. The handwritten manuscript for the paragraph begins on a new letterhead, and it is lacking in one of the two English translations of the German original that were found among Bullitt's papers.]

The present translation is a revised and corrected reprint of the *SE* version.

This paper seems to have been written in the last month of 1931 (Jones, 1957, 177).

The connection between fire and micturition, which is the central feature of this discussion of the myth of Prometheus, had long been familiar to Freud. It provides the key to the analysis of the first dream in the case history of 'Dora' (1905*e* [1901]), *RSE*, **7**, 57 ff., and it crops up again in the much later 'Wolf Man' analysis (1918*b* [1914]), ibid., **17**, 82–3. In both these cases the topic of enuresis is involved, and this links up with another main thread in the present paper – the close association, physiological and psychological, between the two functions of the penis (p. 205 f. below). This too has a long history in Freud's earlier writings, for it too is explicitly remarked on in the 'Dora' analysis (*RSE*, **7**, 29). Earlier still, in a letter to Fliess of September 27, 1898, Freud had declared that 'a child who regularly wets his bed up to his seventh year . . . , must have experienced sexual excitation in infancy' (Freud, [186]

1950*a*, Letter 97).[1] The equivalence of enuresis and masturbation was insisted upon repeatedly at all periods: once more, for instance, in 'Dora', *RSE*, **7**, 70; in the *Three Essays* (1905*d*), ibid., **7**, 168; in the paper on hysterical attacks (1909*a*), ibid., **9**, 204, and, much later, in 'The Dissolution of the Oedipus Complex' (1924*d*), ibid., **19**, 168 f., and the paper on the anatomical distinction between the sexes (1925*j*), ibid., **19**, 251.

Another connection of urethral erotism, in the field of character formation, is not mentioned in this paper, though it appears in the footnote to *Civilization and its Discontents* (1930*a*), ibid., **21**, 82 f. *n.* 3, of which this paper is an expansion. The relation between urethral erotism and ambition was first pointed out explicitly in 'Character and Anal Erotism' (1908*b*), ibid., **9**, 153 f.; but something very similar, its connection with feelings of grandeur and megalomania, had been discussed at two points in *The Interpretation of Dreams* (1900*a*), ibid., **4**, 193, and **5**, 419 f., in the latter of which the extinction of fire makes an incidental appearance. The connection with ambition was alluded to in passing once or twice later on, and was given a rather longer mention soon after the appearance of the present paper, in Lecture XXXII of the *New Introductory Lectures* (1933*a*), p. 90 above.

1 The early paper 'On a Symptom which Often Accompanies *Enuresis Nocturna* in Children' (1893*g*) is a purely neurological work with no psychological bearing. (See *RSE*, **3**, 243; *NSW*, **1**.)

THE ACQUISITION AND CONTROL OF FIRE

In a footnote to my *Civilization and its Discontents* [1930*a*][1] I mentioned – though only incidentally – a conjecture which could be formed on the basis of psychoanalytic material, about primal man's acquisition of control over fire. I am led to take up this theme again by Albrecht Schaeffer's contradiction (1930) and by Erlenmeyer's striking reference in the preceding paper[2] to the Mongolian law against 'pissing on ashes'.[3] [187]

For I think my hypothesis – that, in order to gain control over fire, men had to renounce the homosexually tinged desire [*Lust*][T] to put it out with a stream of urine – can be confirmed by an interpretation [*Deutung*][T] of the Greek myth of Prometheus, provided that we bear in mind the distortions which must be expected to occur in the transition from facts to the contents of a myth. These distortions are of the same sort as, and no worse than, those which we acknowledge every day, when we reconstruct from patients' dreams the repressed [*verdrängten*][T] but extremely important experiences of their childhood. The mechanisms employed in the distortions I have in mind are symbolic representation and turning into the opposite. I should not venture to explain *all* the features of our myth in this fashion; apart from the original set of facts, other and later occurrences may have contributed to its content. But the elements which admit of analytic interpretation are, after all, the most striking and important – viz. the manner in which Prometheus transported the fire, the character of his act (an outrage, a theft, a defrauding of the gods) and the meaning of his punishment. *Verdrängung* [188]

1 [*RSE*, **21**, 82 f. *n*. 3.]

2 [The article by Erlenmeyer (1932) was printed immediately before Freud's in the issue of *Imago* in which this first appeared, and (in an English translation) immediately after the English version of the present paper in *Int. J. Psycho-Anal.*, **13**.]

3 This refers no doubt to hot ashes, from which fire can still be obtained, and not to ashes which are quite extinct. – The objection raised by Lorenz (1931) is based on the assumption that man's subjugation of fire began only when he discovered that he could produce it at will by some sort of manipulation. As against this, Dr J. Hárnik refers me to a remark made by Dr Richard Lasch (in Georg Buschan's compilation, *Illustrierte Völkerkunde*, 1922, **1**, 24), who writes: 'Presumably the art of *conserving* fire was understood long before that of *kindling* it; we have evidence of this in the fact that, although the present-day pygmy-like [negrito] aborigines of the Andamans possess and conserve fire, they have no indigenous method of kindling it.'

The myth tells us that Prometheus the Titan, a culture hero who was still a god[1] and who was perhaps originally himself a demiurge and a creator of men, brought fire to men, having stolen it from the gods, hidden in a hollow stick, a fennel-stalk. If we were interpreting a dream we should be inclined to regard such an object as a penis symbol, although the unusual stress laid on its hollowness might make us hesitate. But how can we bring this penis-tube into connection with the preservation of fire? There seems little chance of doing this, till we remember the procedure of reversal, of turning into the opposite, of inverting relationships, which is so common in dreams and which so often conceals their meaning from us. What a man harbours in his penis-tube is not fire. On the contrary, it is the means of *quenching* fire; it is the water of his stream of urine. This relationship between fire and water then connects up with a wealth of familiar analytic material.

Secondly, the acquisition of fire was a crime; it was accomplished by robbery or theft. This is a constant feature in all the legends about the acquiring of control over fire. It is found among the most different and widely separated peoples and not merely in the Greek myth of Prometheus the Bringer of Fire. Here, then, must be the essential content of mankind's distorted recollection. But why is the acquisition of fire inseparably connected with the idea of a crime? Who is it that was injured or defrauded by it? The Promethean myth in Hesiod gives us a straight answer; for, in another story, not itself directly connected with fire, Prometheus so arranged the sacrifices to the gods as to give men
[189] the advantage over Zeus.[2] It is the gods, then, who were defrauded. We know that in myths the gods are granted the satisfaction of all the desires which human creatures have to renounce, as we have learnt from the case of incest.[3] Speaking in analytic terms, we should say that the life of
Trieb the drives [*Triebleben*][T] – the id – is the god who is defrauded when the quenching of fire is renounced: in the legend, a human desire is transformed into a divine privilege. But in the legend the deity possesses nothing of the characteristics of a superego [*Über-Ichs*][T], he is still the representative [*Repräsentant*] of the paramount life of the drives.

1 Heracles, at a later time, was a demi-god, and Theseus wholly human.

2 ['It being agreed that men should sacrifice to the gods and share the victim with them, the question arose which part of the victim should be for men and which for the gods. Prometheus was called upon to arbitrate. He killed an ox, cut it up, and separated the flesh and entrails from the bones. The latter he wrapped in fat and made, with the hide, into a bundle; the rest he enclosed in the stomach. Zeus, on being given his choice, at once snatched the inviting-looking parcel of fat, and was furious to find that he had got little but bones.' (Rose, 1928, 55, from Hesiod, *Theogonia*, 535 ff.)]

3 [Cf. 'Obsessive Actions and Religious Practices' (1907*b*), *RSE*, **9**, 104 f., and *The Question of Lay Analysis* (1926*e*), ibid., **20**, 190.]

Transformation into the opposite is most radically present in a third feature of the legend, in the punishment of the Bringer of Fire. Prometheus was chained to a rock, and every day a vulture fed on his liver. In the fire legends of other peoples, too, a bird plays a part, and it must have something to do with the matter; but for the moment I shall not attempt an interpretation. On the other hand, we feel on firm ground when it comes to explaining why the liver was selected as the location of the punishment. In ancient times the liver was regarded as the seat of all passions and desires; hence a punishment like that of Prometheus was the right one for a criminal impelled by his drives, who had committed an offence at the prompting of evil desires. But the exact opposite is true of the Bringer of Fire: he had renounced a drive and had shown how beneficent, and at the same time how indispensable, such a renunciation was for the purposes of civilization [*in kultureller Absicht*]^{T}. And why should the legend treat a deed that was thus a benefit to civilization as a crime deserving punishment? Well, if, through all its distortions, it barely allows us to get a glimpse of the fact that the acquisition of control over fire presupposes renunciation of a drive, at least it makes no secret of the resentment which the culture hero [*Kulturheros*] could not fail to arouse in men impelled by their drives. And this is in accordance with what we know and expect. We know that a demand for a renunciation of drive, and the enforcement of that demand, call out hostility and aggressiveness [*Aggressionslust*]^{T}, which is only transformed into a sense of guilt in a later phase of psychical development.[1]

Kultur

[190] *Lust*

The obscurity of the Prometheus legend, as of other fire-myths, is increased by the fact that primitive man was bound to regard fire as something analogous to the passion of love – or, as we should say, as a symbol of the libido. The warmth that is radiated by fire calls up the same sensation that accompanies a state of sexual excitation [*Erregtheit*]^{T}, and the shape and movements of a flame suggest a phallus in activity. There can be no doubt about the mythological significance of flame as a phallus; we have further evidence of it in the legend of the parentage of Servius Tullius, the Roman king.[2] When we ourselves speak of the 'devouring fire' of love and of 'licking' flames – thus comparing the flame to a tongue – we have not moved so very far away from the mode of thinking of our primitive ancestors. One of the presuppositions

Erregung

1 [For all of this see *Civilization and its Discontents* (1930*a*), particularly Chapter VII; *RSE*, **21**.]

2 [His mother, Ocrisia, was a slave in the household of King Tarquin. One day she 'was offering as usual cakes and libations of wine on the royal hearth, when a flame in the shape of a male member shot out from the fire . . . Ocrisia conceived by the god or spirit of the fire and in due time brought forth Servius Tullius' (Frazer, 1911*a*, **2**, 195).]

on which we based our account of the myth of the acquisition of fire[1] was, indeed, that to primal man the attempt to quench fire with his own water had the meaning of a pleasurable struggle [*lustvolles Ringen*] with another phallus.

Phantasie

It may thus well be that, by way of this symbolic analogy, other elements, of a purely imaginative [*phantastische*][T] sort, have made their way into the myth and become interwoven with its historical elements. It is difficult to resist the notion that, if the liver is the seat of passion, its significance, symbolically, is the same as that of fire itself; and that, if this is so, its being daily consumed and renewed gives an apt picture of the behaviour of the erotic desires, which, though daily satisfied, are daily revived. The bird which sates itself on the liver would then have the meaning of a penis – a meaning which is not strange to it in other connections, as we know from legends, dreams, linguistic usage and [191] plastic representations in ancient times.[2] A short step further brings us to the phoenix, the bird which, as often as it is consumed by fire, emerges rejuvenated once more, and which probably bore the significance of a penis revivified after its collapse rather than, and earlier than, that of the sun setting in the glow of evening and afterwards rising once again.

Seele

The question may be asked whether we may attribute to the mythopoeic activity an attempt to give (in play, as it were) a disguised representation to universally familiar, though also extremely interesting, mental [*seelischer*][T] processes that are accompanied by physical manifestations, with no motive [*Motiv*][T] other than the sheer pleasure of representation. We can certainly give no decided answer to this question without having fully grasped the nature of myths; but in the two instances before us [Prometheus's liver and the phoenix], it is easy to recognize the same content and, with it, a definite purpose. Each describes the revival of libidinal desires [*Gelüste*] after they have been quenched through being sated. That is to say, each brings out the indestructibility of those desires; and this emphasis is particularly appropriate as a consolation where the historical core of the myth[3] deals with a defeat of drive activity, with a renunciation of drive that has become necessary. It is, as it were, the second part of primal man's understandable reaction when he has suffered a blow in his drives: after the punishment of the offender comes the assurance that after all at bottom he has done no damage.

A reversal into the opposite is unexpectedly found in another myth

1 [See p. 201 above.]

2 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 352 f. and 521 f.]

3 [Cf. a long Editors' footnote on this in Part II (G) of the third essay of *Moses and Monotheism* (1939*a*), ibid., **23**, 118 *n.* 3.]

which in appearance has very little to do with the fire-myth. The Lernaean hydra with its countless flickering serpent's heads – one of which was immortal – was, as its name tells us, a water dragon. Heracles, the culture hero, fought it by cutting off its heads; but they always grew again, and it was only after he had burnt up the immortal head with fire that he overcame the monster. A water dragon subdued by fire – that surely makes no sense. But, as in so many dreams, sense emerges if we reverse the manifest content. In that case the hydra is a brand of fire and the flickering serpent's heads are the flames; and these, in proof of their libidinal nature, once more display, like Prometheus's liver, the phenomenon of regrowth, of renewal after attempted destruction. Heracles, then, extinguishes this brand of fire with – water. (The [192]
immortal head is no doubt the phallus itself, and its destruction signifies castration.) But Heracles was also the deliverer of Prometheus and slew the bird which devoured his liver. Should we not suspect a deeper connection between the two myths? It is as though the deed of the one hero was made up for by the other. Prometheus (like the Mongolian law) had forbidden the quenching of fire; Heracles permitted it in the case in which the brand of fire threatened disaster. The second myth seems to correspond to the reaction of a later epoch of civilization [*Kulturzeit*] to the events of the acquisition of power over fire. It looks as though this line of approach might take us quite a distance into the secrets of the myth; but admittedly we should carry a feeling of certainty with us only a short way.

In the antithesis between fire and water, which dominates the entire field of these myths, yet a third factor can be demonstrated in addition to the historical factor and the factor of symbolic phantasy. This is a physiological fact, which the poet Heine describes in the following lines:

> Was dem Menschen dient zum Seichen
> Damit schafft er Seinesgleichen.[1]

The sexual organ of the male has two functions; and there are those to whom this association is an annoyance. It serves for the evacuation of the bladder, and it carries out the act of love which sets the craving of the genital libido at rest. The child still believes that he can unite the two functions. According to a theory of his, babies are made by the man

1 [Literally 'With what serves a man for pissing he creates his like.' 'Zur Teleologie', from the *Nachlese*, 'Aus der Matratzengruft', No. XVII.]

urinating into the woman's body.[1] But the adult knows that in reality the acts are mutually incompatible – as incompatible as fire and water. When the penis is in the state of excitation which led to its comparison with a bird, and while the sensations are being experienced which suggest the warmth of fire, urination is impossible; and conversely, when the organ is serving to evacuate urine (the water of the body) all its connections with the genital function seem to be quenched. The antithesis between the two functions might lead us to say that man quenches [193] his own fire with his own water. And primal man, who had to understand the external world by the help of his own bodily sensations and states, would surely not have failed to notice and utilize the analogies pointed out to him by the behaviour of fire.

1 [Cf. 'On the Sexual Theories of Children' (1908*c*), *RSE*, **9**, 193 and 194 f.]

WHY WAR?

(1933 [1932])

(EINSTEIN & FREUD)

Freud sitting for Oscar Némon, 1931

Freud sitting for Oscar Némon, 1931

In a letter to Arnold Zweig dated May 10, 1931, Freud wrote: 'Tomorrow I shall make my first attempt to creep back to work. An hour in the morning and another in the afternoon. Living one's life for one's health and guarded like an historical monument is otherwise hard to bear.'

2005 *PMC*, *On Murder, Mourning and Melancholia*, 219–32. (Omitting Einstein's letter.) (Tr. Shaun Whiteside.)

The present translation is a revised and corrected reprint of the *SE* version. Einstein's letter is included here by permission of his executors and at their request is given in the original English version by Stuart Gilbert. (For this reason, the translation is not consistent with *RSE* style, e.g. '*Trieb*' is translated as 'instinct' rather than 'drive'.) Part of the German text of Freud's letter was also published in *Psychoan. Beweg.*, **5** (1933), 207–16.

It was in 1931 that the International Institute of Intellectual Co-operation was instructed by the Permanent Committee for Literature and the Arts of the League of Nations to arrange for exchanges of letters between representative intellectuals 'on subjects calculated to serve the common interests of the League of Nations and of intellectual life', and to publish these letters periodically. Among the first [198] to be approached by the Institute was Einstein and it was he who suggested

Freud's name. Accordingly, in June, 1932, the Secretary of the Institute wrote to Freud inviting his participation, to which he at once agreed. Einstein's letter reached him at the beginning of August and his reply was finished a month later. The correspondence was published in Paris by the Institute in March, 1933, in German, French and English simultaneously. Its circulation was, however, forbidden in Germany.

Freud himself was not enthusiastic about the work, and wrote of it as a tedious and sterile discussion (Jones, 1957, 187). The two men were never at all intimate with each other and met only once, at the beginning of 1927, in the house of Freud's youngest son, Ernst, in Berlin. In a letter to Ferenczi describing the occasion, Freud wrote: 'He understands as much about psychology as I do about physics, so we had a very pleasant talk.' (Ibid., 139.) Some very friendly letters were exchanged between them in subsequent years (see *RSE*, **21**, 237 ff., and p. 276 below).

Freud had written on the subject of war before: in the first section ('The Disillusionment of the War') of his paper 'Thoughts for the Times on War and Death' (1915*b*), *RSE*, **14**, produced soon after the beginning of the First World War. But though some of the considerations discussed in the present paper appear in the earlier one, they are more closely related to the thoughts expressed in his recent writings on sociological subjects – *The Future of an Illusion* (1927*c*), ibid., **21**, and *Civilization and its Discontents* (1930*a*), ibid., **21**. Particular interest attaches to some further development here of Freud's view of civilization as a 'process', which had been brought up by him at several points in the latter work (e.g. at the end of Chapter III, ibid., **21**, 88–9, and in the latter part of Chapter VIII, ibid., 125 ff.).[1] He also takes up once more the topic of the destructive drive, of which he had given a first considerable account in Chapters V and VI of the same book, and to which he was to return in later writings. (Cf. the Editors' Introduction to *Civilization and its Discontents*, ibid., 57–8.)

1 See also an Editors' footnote to the last of the *New Introductory Lectures* (1933*a*), p. 157 *n.* 3 above, and another on p. 224 below.

WHY WAR?

Caputh near Potsdam, 30th July, 1932 [199]

Dear Professor Freud,

The proposal of the League of Nations and its International Institute of Intellectual Co-operation at Paris that I should invite a person, to be chosen by myself, to a frank exchange of views on any problem that I might select affords me a very welcome opportunity of conferring with you upon a question which, as things now are, seems the most insistent of all the problems civilization has to face. This is the problem: Is there any way of delivering mankind from the menace of war? It is common knowledge that, with the advance of modern science, this issue has come to mean a matter of life and death for civilization as we know it; nevertheless, for all the zeal displayed, every attempt at its solution has ended in a lamentable breakdown.

I believe, moreover, that those whose duty it is to tackle the problem professionally and practically are growing only too aware of their impotence to deal with it, and have now a very lively desire to learn the views of men who, absorbed in the pursuit of science, can see world-problems in the perspective distance lends. As for me, the normal objective of my thought affords no insight into the dark places of human will and feeling. Thus, in the enquiry now proposed, I can do little more than seek to clarify the question at issue and, clearing the ground of the more obvious solutions, enable you to bring the light of your far-reaching knowledge of man's instinctive life to bear upon the problem. There are certain psychological obstacles whose existence a layman in the mental sciences may dimly surmise, but whose interrelations and vagaries he is incompetent to fathom; you, I am convinced, will be able to suggest educative methods, lying more or less outside the scope of politics, which will eliminate these obstacles.

As one immune from nationalist bias, I personally see a simple way of dealing with the superficial (i.e. administrative) aspect of the problem:

the setting up, by international consent, of a legislative and judicial body
[200] to settle every conflict arising between nations. Each nation would undertake to abide by the orders issued by this legislative body, to invoke its decision in every dispute, to accept its judgements unreservedly and to carry out every measure the tribunal deems necessary for the execution of its decrees. But here, at the outset, I come up against a difficulty; a tribunal is a human institution which, in proportion as the power at its disposal is inadequate to enforce its verdicts, is all the more prone to suffer these to be deflected by extrajudicial pressure. This is a fact with which we have to reckon; law and might inevitably go hand in hand, and juridical decisions approach more nearly the ideal justice demanded by the community (in whose name and interests these verdicts are pronounced) in so far as the community has effective power to compel respect of its juridical ideal. But at present we are far from possessing any supranational organization competent to render verdicts of incontestable authority and enforce absolute submission to the execution of its verdicts. Thus I am led to my first axiom: the quest of international security involves the unconditional surrender by every nation, in a certain measure, of its liberty of action, its sovereignty that is to say, and it is clear beyond all doubt that no other road can lead to such security.

The ill-success, despite their obvious sincerity, of all the efforts made during the last decade to reach this goal leaves us no room to doubt that strong psychological factors are at work, which paralyse these efforts. Some of these factors are not far to seek. The craving for power which characterizes the governing class in every nation is hostile to any limitation of the national sovereignty. This political power-hunger is wont to batten on the activities of another group, whose aspirations are on purely mercenary, economic lines. I have specially in mind that small but determined group, active in every nation, composed of individuals who, indifferent to social considerations and restraints, regard warfare, the manufacture and sale of arms, simply as an occasion to advance their personal interests and enlarge their personal authority.

But recognition of this obvious fact is merely the first step towards an appreciation of the actual state of affairs. Another question follows hard upon it: How is it possible for this small clique to bend the will of the majority, who stand to lose and suffer by a state of war, to the service
[201] of their ambitions? (In speaking of the majority, I do not exclude soldiers of every rank who have chosen war as their profession, in the belief that they are serving to defend the highest interests of their race, and that attack is often the best method of defence.) An obvious answer

to this question would seem to be that the minority, the ruling class at present, has the schools and press, usually the Church as well, under its thumb. This enables it to organize and sway the emotions of the masses, and make its tool of them.

Yet even this answer does not provide a complete solution. Another question arises from it: How is it these devices succeed so well in rousing men to such wild enthusiasm, even to sacrifice their lives? Only one answer is possible. Because man has within him a lust for hatred and destruction. In normal times this passion exists in a latent state, it emerges only in unusual circumstances; but it is a comparatively easy task to call it into play and raise it to the power of a collective psychosis. Here lies, perhaps, the crux of all the complex of factors we are considering, an enigma that only the expert in the lore of human instincts can resolve.

And so we come to our last question. Is it possible to control man's mental evolution so as to make him proof against the psychoses of hate and destructiveness? Here I am thinking by no means only of the so-called uncultured masses. Experience proves that it is rather the so-called 'Intelligentzia' that is most apt to yield to these disastrous collective suggestions, since the intellectual has no direct contact with life in the raw, but encounters it in its easiest synthetic form – upon the printed page.

To conclude: I have so far been speaking only of wars between nations; what are known as international conflicts. But I am well aware that the aggressive instinct operates under other forms and in other circumstances. (I am thinking of civil wars, for instance, due in earlier days to religious zeal, but nowadays to social factors; or, again, the persecution of racial minorities.) But my insistence on what is the most typical, most cruel and extravagant form of conflict between man and man was deliberate, for here we have the best occasion of discovering ways and means to render all armed conflicts impossible.

I know that in your writings we may find answers, explicit or implied, to all the issues of this urgent and absorbing problem. But it would be of the greatest service to us all were you to present the problem of [202]
world peace in the light of your most recent discoveries, for such a presentation well might blaze the trail for new and fruitful modes of action.

Yours very sincerely,

A. EINSTEIN

[203] Vienna, September, 1932

Dear Professor Einstein,

When I heard that you intended to invite me to an exchange of views on some subject that interested you and that seemed to deserve the interest of others besides yourself, I readily agreed. I expected you to choose a problem on the frontiers of what is knowable today, a problem to which each of us, a physicist and a psychologist, might have our own particular angle of approach and where we might come together from different directions upon the same ground. You have taken me by surprise, however, by posing the question of what can be done to protect mankind from the curse of war.[1] I was scared at first by the thought of my – I had almost written 'our' – incapacity for dealing with what seemed to be a practical problem, a concern for statesmen. But I then realized that you had raised the question not as a natural scientist and physicist but as a philanthropist: you were following the promptings of the League of Nations just as Fridtjof Nansen, the polar explorer, took on the work of bringing help to the starving and homeless victims of the World War. I reflected, moreover, that I was not being asked to make practical proposals but only to set out the problem of avoiding war as it appears to a psychological observer. Here again you yourself have said almost all there is to say on the subject. But though you have taken the wind out of my sails I shall be glad to follow in your wake and content myself with confirming all you have said by amplifying it to the best of my knowledge – or conjecture.

You begin with the relation between Right and Might.[2] There can be no doubt that that is the correct starting point for our investigation. But
[204] may I replace the word 'might' with the balder and harsher word 'violence'? Today right and violence appear to us as antitheses. It can easily be shown, however, that the one has developed out of the other; and, if we go back to the earliest beginnings and see how that first came about, the problem is easily solved. You must forgive me if in what follows I go over familiar and commonly accepted ground as though it were new, but the thread of my argument requires it.

1 ['Das Verhängnis des Krieges.' Freud quotes Einstein's actual words, which are, however, translated differently on p. 211 above.]

2 [In the original the words '*Recht*' and '*Macht*' are used throughout Freud's letter and in Einstein's. It has unfortunately been necessary to sacrifice this stylistic unity in the translation. '*Recht*' has been rendered indifferently by 'right', 'law' and 'justice'; and '*Macht*' by 'might', 'force' and 'power'. See *RSE*, **24**, 73–4.]

It is a general principle, then, that conflicts of interest between men are settled by the use of violence. This is true of the whole animal kingdom, from which men have no business to exclude themselves. In the case of men, no doubt, conflicts of *opinion* occur as well which may reach the highest pitch of abstraction and which seem to demand some other technique for their settlement. That, however, is a later complication. To begin with, in a small human horde,[1] it was superior muscular strength which decided who owned things or whose will should prevail. Muscular strength was soon supplemented and replaced by the use of tools: the winner was the one who had the better weapons or who used them the more skilfully. From the moment at which weapons were introduced, intellectual superiority already began to replace brute muscular strength; but the final purpose of the fight remained the same – one side or the other was to be compelled to abandon his claim or his objection by the damage inflicted on him and by the crippling of his strength. That purpose was most completely achieved if the victor's violence eliminated his opponent permanently – that is to say, killed him. This had two advantages: he could not renew his opposition and his fate [*Schicksal*]^{T} deterred others from following his example. In addition to this, killing an enemy satisfied an inclination of the drives [*triebhafte Neigung*]^{T} which I shall have to mention later. The intention *Trieb*
to kill might be countered by a reflection that the enemy could be employed in performing useful services if he were left alive in an intimidated condition. In that case the victor's violence was content with subjugating him instead of killing him. This was a first beginning of the idea of sparing an enemy's life, but thereafter the victor had to reckon with his defeated opponent's lurking thirst for revenge and sacrificed some of his own security.

Such, then, was the original state of things: domination by whoever had the greater might – domination by brute violence or by violence [205]
supported by intellect. As we know, this regime was altered in the course of evolution. There was a path that led from violence to right or law. What was that path? It is my belief that there was only one: the path which led by way of the fact that the superior strength of a single individual could be rivalled by the union of several weak ones. '*L'union fait la force.*' Violence could be broken by union, and the power of those who were united now represented law in contrast to the violence of the single individual. Thus we see that right is the might of a community. It is still violence, ready to be directed against any individual

1 [See footnote 2, p. 155 above.]

who resists it; it works by the same methods and follows the same purposes. The only real difference lies in the fact that what prevails is no longer the violence of an individual but that of a community. But in order that the transition from violence to this new right or justice may be effected, one psychological condition must be fulfilled. The union of the majority must be a stable and lasting one. If it were only brought about for the purpose of combating a single dominant individual and were dissolved after his defeat, nothing would have been accomplished. The next person who thought himself superior in strength would once more seek to set up a dominion by violence and the game would be repeated *ad infinitum*. The community must be maintained permanently, must be organized, must draw up regulations to anticipate the risk of rebellion and must institute authorities to see that those regulations – the laws – are respected and to superintend the execution of legal acts of violence. The recognition of a community of interests such as these leads to the growth of emotional ties between the members of a united group of people – communal feelings which are the true source of its strength.

Here, I believe, we already have all the essentials: violence overcome by the transference of power to a larger unity, which is held together by emotional ties between its members. What remains to be said is no more than an expansion and a repetition of this.

The situation is simple so long as the community consists only of a number of equally strong individuals. The laws of such an association will determine the extent to which, if the security of communal life is
[206] to be guaranteed, each individual must surrender his personal liberty to turn his strength to violent uses. But a state of rest of that kind is only theoretically conceivable. In actuality the position is complicated by the fact that from its very beginning the community comprises elements of unequal strength – men and women, parents and children – and soon, as a result of war and conquest, it also comes to include victors and vanquished, who turn into masters and slaves. The justice of the community then becomes an expression of the unequal degrees of power obtaining within it; the laws are made by and for the ruling members and find little room for the rights of those in subjection. From that time forward there are two factors at work in the community which are sources of unrest over matters of law but tend at the same time to a further growth of law. First, attempts are made by certain of the rulers to set themselves above the prohibitions which apply to everyone – they

seek, that is, to go back from a dominion of law to a dominion of violence. Secondly, the oppressed members of the group make constant efforts to obtain more power and to have any changes that are brought about in that direction recognized in the laws – they press forward, that is, from unequal justice to equal justice for all. This second tendency becomes especially important if real shifts [*Verschiebungen*][T] of power occur within a community, as may happen as a result of a number of historical factors. In that case right may gradually adapt itself to the new distribution of power; or, as is more frequent, the ruling class is unwilling to recognize the change, and rebellion and civil war follow, with a temporary suspension of law and new attempts at a solution by violence, ending in the establishment of a fresh rule of law. There is yet another source from which modifications of law may arise, and one of which the expression is invariably peaceful: it lies in the cultural [*kulturelle*][T] transformation of the members of the community. This, *Kultur*
however, belongs properly in another connection and must be considered later. [p. 224 below.]

Thus we see that the violent solution of conflicts of interest is not avoided even inside a community. But the everyday necessities and common concerns that are inevitable where people live together in one place tend to bring such struggles to a swift conclusion and under such conditions there is an increasing probability that a peaceful solution will be found. Yet a glance at the history of the human race reveals an endless series of conflicts between one community and another or several [207]
others, between larger and smaller units – between cities, provinces, races, nations, empires – which have almost always been settled by force [*Kraftprobe*][T] of arms. Wars of this kind end either in the spoliation or *Kraft*
in the complete overthrow and conquest of one of the parties. It is impossible to make any sweeping judgement upon war of conquest. Some, such as those waged by the Mongols and Turks, have brought nothing but evil. Others, on the contrary, have contributed to the transformation of violence into law by establishing larger units within which the use of violence was made impossible and in which a fresh system of law led to the solution of conflicts. In this way the conquests of the Romans gave the countries round the Mediterranean the priceless *pax Romana*, and the greed of the French kings to extend their dominions created a peacefully united and flourishing France. Paradoxical as it may sound, it must be admitted that war might be a far from inappropriate means of establishing the eagerly desired reign of 'everlasting' peace, since it is in a position to create the large units within which a powerful

central government makes further wars impossible. Nevertheless it fails in this purpose, for the results of conquest are as a rule shortlived: the newly created units fall apart once again, usually owing to a lack of cohesion between the portions that have been united by violence. Hitherto, moreover, the unifications created by conquest, though of considerable extent, have only been *partial*, and the conflicts between these have called out more than ever for violent solution. Thus the result of all these warlike efforts has only been that the human race has exchanged numerous, and indeed unending, minor wars for wars on a grand scale that are rare but all the more destructive.

If we turn to our own times, we arrive at the same conclusion which you have reached by a shorter path. Wars will only be prevented with certainty if mankind unites in setting up a central authority to which the right of giving judgement upon all conflicts of interest shall be handed over. There are clearly two separate requirements involved in this: the creation of a supreme agency and its endowment with the necessary power. One without the other would be useless. The League of Nations is designed as an agency of this kind, but the second condition has not
[208] been fulfilled: the League of Nations has no power of its own and can only acquire it if the members of the new union, the separate States, are ready to resign it. And at the moment there seems very little prospect of this. The institution of the League of Nations would, however, be wholly unintelligible if one ignored the fact that here was a bold attempt such as has seldom (perhaps, indeed, never on such a scale) been made before. It is an attempt to base upon an appeal to certain idealistic attitudes of mind the authority (that is, the coercive influence) which otherwise rests on the possession of power. We have seen [p. 215 f. above] that a community is held together by two things: the compelling force of violence and the emotional ties (identifications is the technical name) between its members. If one of the factors is absent, the community may possibly be held together by the other. The ideas that are appealed to can, of course, only have any significance if they give expression to important affinities between the members, and the question arises of how much strength such ideas can exert. History teaches us that they have been to some extent effective. For instance, the Panhellenic idea, the sense of being superior to the surrounding barbarians – an idea which was so powerfully expressed in the Amphictyonic Council, the Oracles and the Games – was sufficiently strong to mitigate the customs of war among Greeks, though evidently not sufficiently strong to prevent warlike disputes between the different sections of the Greek nation

or even to restrain a city or confederation of cities from allying itself with the Persian foe in order to gain an advantage over a rival. The community of feeling among Christians, powerful though it was, was equally unable at the time of the Renaissance to deter Christian States, whether large or small, from seeking the Sultan's aid in their wars with one another. Nor does any idea exist today which could be expected to exert a unifying authority of the sort. Indeed it is all too clear that the national ideals by which nations are at present swayed operate in a contrary direction. Some people are inclined to prophesy that it will not be possible to make an end of war until Communist ways of thinking have found universal acceptance. But that aim is in any case a very remote one today, and perhaps it could only be reached after the most fearful civil wars. Thus the attempt to replace actual force with the force of ideas seems at present to be doomed to failure. We shall be making a false calculation if we disregard the fact that law was originally brute [209] violence and that even today it cannot do without the support of violence.

I can now proceed to add a gloss to another of your remarks. You express astonishment at the fact that it is so easy to make men enthusiastic about a war and add your suspicions [p. 213 above] that there is something at work in them – a drive to hatred and destruction – which goes halfway to meet the efforts of the warmongers. Once again, I can only express my entire agreement. We believe in the existence of a drive of that kind and have in fact been occupied during the last few years in studying its manifestations. Will you allow me to take this opportunity of putting before you a portion of the theory of the drives which, after much tentative groping and many fluctuations of opinion, has been reached by workers in the field of psychoanalysis?

According to our hypothesis human drives are of only two kinds: those which seek to preserve and unite – which we call 'erotic', exactly in the sense in which Plato uses the word 'Eros' in his *Symposium*, or 'sexual' [*sexuelle*][T], with a deliberate extension of the popular conception of 'sexuality' – and those which seek to destroy and kill and which we group together as the aggressive or destructive drive. As you see, this is in fact no more than a theoretical clarification of the universally familiar opposition between Love and Hate which may perhaps have some fundamental relation to the polarity of attraction and repulsion that plays a part in your own field of knowledge. But we must not be too hasty in introducing ethical judgements of good and evil. Neither

Sex

of these drives is any less essential than the other; the phenomena of life arise from the concurrent or mutually opposing action of both. Now it seems as though a drive of the one sort can scarcely ever operate in isolation; it is always accompanied – or, as we say, alloyed – with a certain quota from the other side, which modifies its aim or is, in some cases, what enables it to achieve that aim. Thus, for instance, the drive to self-preservation [*Selbsterhaltungstrieb*][T] is certainly of an erotic kind, but it must nevertheless have aggressiveness at its disposal if it is to fulfil its purpose. So, too, the drive to love, when it is directed towards an object, stands in need of some contribution from the drive to mastery [*Bemächtigungstrieb*] if it is in any way to obtain possession of that object. The difficulty of isolating the two classes of drives in their actual manifestations is indeed what has so long prevented us from recognizing them.

Selbsterhaltung

[210]

If you will follow me a little further, you will see that human actions are subject to another complication of a different kind. It is very rarely that an action is the work of a *single* drive impulse (which must in itself be compounded of Eros and destructiveness). In order to make an action possible there must be as a rule a combination of such compounded motives [*Motive*][T]. This was perceived long ago by a specialist in your own subject, a Professor G. C. Lichtenberg who taught physics at Göttingen during our classical age – though perhaps he was even more remarkable as a psychologist than as a physicist.[1] He invented a Compass of Motives, for he wrote: 'The motives [*Bewegungsgründe*] that lead us to do anything might be arranged like the thirty-two winds and might be given names in a similar way: for instance, "bread-bread-fame" or "fame-fame-bread".' So that when human beings are incited to war they may have a whole number of motives for assenting – some noble and some base, some which are openly declared and others which are never mentioned. There is no need to enumerate them all. A lust [*Lust*][T] for aggression and destruction is certainly among them: the countless cruelties in history and in our everyday lives vouch for its existence and its strength. The satisfaction of these destructive impulses is of course facilitated by their admixture with others of an erotic and idealistic kind. When we read of the atrocities of the past, it sometimes seems as though the idealistic motives served only as an excuse for the destructive appetites; and sometimes – in the case, for instance, of the cruelties of

1 [Georg Christoph Lichtenberg (1742–99) was a favourite author of Freud's. The present analogy had already been quoted in his book on *Jokes* (1905*c*), *RSE*, **8**, 75, in which a great number of Lichtenberg's epigrams can be found.]

the Inquisition – it seems as though the idealistic motives had pushed themselves forward in consciousness, while the destructive ones lent them an unconscious reinforcement. Both may be true.

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless, I should like to linger for a moment over our destructive drive, whose popularity [211] is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this drive is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death drive, while the erotic drives represent the effort to live. The death drive turns into the destructive drive when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death drive, however, remains operative *within* the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive drive. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these driving forces [*Triebkräfte*] are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses [*Strebungen*] against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said today of your own physics?

For our immediate purpose then, this much follows from what has been said: there is no use in trying to get rid of men's aggressive inclinations [*Neigungen*]. We are told that in certain happy regions of the earth, where Nature provides in abundance everything that man requires, there are races whose life is passed in tranquillity and who know neither coercion nor aggression. I can scarcely believe it and I should be glad to hear more of these fortunate beings. The Russian Communists, too, hope to be able to cause human aggressiveness to disappear by

guaranteeing the satisfaction of all material needs and by establishing
[212] equality in other respects among all the members of the community. That, in my opinion, is an illusion. They themselves are armed today with the most scrupulous care and not the least important of the methods by which they keep their supporters together is hatred of everyone beyond their frontiers. In any case, as you yourself have remarked, there is no question of getting rid entirely of human aggressive impulses; it is enough to try to divert them to such an extent that they need not find expression in war.

Our mythological theory of drives makes it easy for us to find a formula for *indirect* methods of combating war. If willingness to engage in war is an effect of the destructive drive, the most obvious plan will be to bring Eros, its antagonist, into play against it. Anything that encourages the growth of emotional ties between men must operate against war. These ties may be of two kinds. In the first place they may be relations resembling those towards a loved object, though without having a sexual aim. There is no need for psychoanalysis to be ashamed to speak of love in this connection, for religion itself uses the same words: 'Thou shalt love thy neighbour as thyself.' This, however, is more easily said than done.[1] The second kind of emotional tie is by means of identification. Whatever leads men to share important interests produces this community of feeling, these identifications. And the structure [*Aufbau*][T] of human society is to a large extent based on them.

A complaint which you make about the abuse of authority [p. 212 above] brings me to another suggestion for the indirect combating of the propensity to war. One instance of the innate and ineradicable inequality of men is their tendency to fall into the two classes of leaders and followers. The latter constitute the vast majority; they stand in need of an authority which will make decisions for them and to which they for the most part offer an unqualified submission. This suggests that more care should be taken than hitherto to educate an upper stratum of men with independent minds, not open to intimidation and eager in the pursuit of truth, whose business it would be to give direction to the dependent masses. It goes without saying that the encroachments made by the executive power of the State and the prohibition laid by the
[213] Church upon freedom of thought are far from propitious for the production of a class of this kind. The ideal condition of things would of course be a community of men who had subordinated their drives to the

1 [Cf. the discussion of this in Chapter V of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 97 ff.]

dictatorship of reason. Nothing else could unite men so completely and so tenaciously, even if there were no emotional ties between them.[1] But in all probability that is a Utopian expectation. No doubt the other indirect methods of preventing war are more practicable, though they promise no rapid success. An unpleasant picture comes to one's mind of mills that grind so slowly that people may starve before they get their flour.

The result, as you see, is not very fruitful when an unworldly theoretician is called in to advise on an urgent practical problem. It is a better plan to devote oneself in every particular case to meeting the danger with whatever means lie to hand. I should like, however, to discuss one more question, which you do not mention in your letter but which specially interests me. Why do you and I and so many other people rebel so violently against war? Why do we not accept it as another of the many painful calamities of life? After all, it seems to be quite a natural thing, to have a good biological basis and in practice to be scarcely avoidable. There is no need to be shocked at my raising this question. For the purpose of an investigation such as this, one may perhaps be allowed to wear a mask of assumed detachment. The answer to my question will be that we react to war in this way because everyone has a right to his own life, because war puts an end to human lives that are full of hope, because it brings individual men into humiliating situations, because it compels them against their will to murder other men, and because it destroys precious material objects which have been produced by the labours of humanity. Other reasons besides might be given, such as that in its present-day form war is no longer an opportunity for achieving the old ideals of heroism and that owing to the perfection of instruments of destruction a future war might involve the extermination of one or perhaps both of the antagonists. All this is true, and so incontestably true that one can only feel astonished that the waging of war [214]
has not yet been unanimously repudiated. No doubt debate is possible upon one or two of these points. It may be questioned whether a community ought not to have a right to dispose of individual lives; every war is not open to condemnation to an equal degree; so long as there exist countries and nations that are prepared for the ruthless destruction of others, those others must be armed for war. But I will not linger over any of these issues; they are not what you want to discuss

1 [Cf. some remarks in Lecture XXXV of the *New Introductory Lectures* (1933*a*), pp. 150–1 above.]

with me, and I have something different in mind. It is my opinion that the main reason why we rebel against war is that we cannot help doing so. We are pacifists because we are obliged to be for organic reasons. And we then find no difficulty in producing arguments to justify our attitude.

No doubt this requires some explanation. My belief is this. For incalculable ages mankind has been passing through a process of evolution of culture [*Kulturentwicklung*]. (Some people, I know, prefer to use the term 'civilization' [*Zivilisation*].)[1] We owe to that process the best of what we have become, as well as a good part of what we suffer from. Though its causes and beginnings are obscure and its outcome uncertain, some of its characteristics are easy to perceive. It may perhaps be leading to the extinction of the human race, for in more than one way it impairs the sexual function; uncultivated races and backward strata of the population are already multiplying more rapidly than highly cultivated ones. The process is perhaps comparable to the domestication of certain species of animals and it is undoubtedly accompanied by physical alterations; but we are still unfamiliar with the notion [*Vorstellung*][T] that the evolution of culture [*Kulturentwicklung*] is an organic process of this kind.[2] The *psychical* modifications that go along with the process of civilization [*Kulturprozess*] are striking and unambiguous. They consist in a progressive displacement [*Verschiebung*][T] of drive aims and a restriction of drive impulses. Sensations which were pleasurable [*lustvoll*] to our ancestors have become indifferent or even intolerable to ourselves; there are organic grounds for the changes in our ethical and aesthetic ideals. Of the psychological characteristics of civilization [*Kultur*] two appear to be the most important: a strengthening of the intellect, which is beginning to govern the life of the drives, and an internalization of the aggressive
[215] impulses, with all its consequent advantages and perils. Now war is in the crassest opposition to the psychical attitude imposed on us by the process of civilization, and for that reason we are bound to rebel against it; we simply cannot any longer put up with it. This is not merely an intellectual and emotional repudiation; we pacifists have a *constitutional* intolerance of war, an idiosyncrasy magnified, as it were, to the highest degree. It seems, indeed, as though the lowering of aesthetic standards in war plays a scarcely smaller part in our rebellion than do its cruelties.

1 [See footnote 3, p. 157 above.]

2 [Cf. the Editors' Note, p. 210 above.]

And how long shall we have to wait before the rest of mankind become pacifists too? There is no telling. But it may not be Utopian to hope that these two factors, the cultural attitude and the justified dread of the consequences of a future war, may result within a measurable time in putting an end to the waging of war. By what paths or by what sidetracks this will come about we cannot guess. But one thing we *can* say: whatever fosters the growth of civilization [*Kulturentwicklung*] works at the same time against war.[1]

I trust you will forgive me if what I have said has disappointed you, and I remain, with kindest regards,

Sincerely yours,

SIGM. FREUD

1 [The idea of a 'process of civilization' may, as explained in footnote 3, p. 157 above, be traced back to Freud's very early period. But he developed it still further. In rather different terms it figures prominently in the third essay of *Moses and Monotheism* (1939*a*), especially in Section C of Part II; *RSE*, **23**, 101 ff. Its two main characteristics (as illustrated in the religion of Moses derived from Akhenaten) are the same as those mentioned here – strengthening of intellectual life and renunciation of drive.]

MY CONTACT WITH JOSEF POPPER-LYNKEUS

The present translation is a lightly revised reprint of the *SE* version.

This paper first appeared in a periodical founded under the influence of Josef Popper (1838–1921), a.k.a. 'Lynkeus', in a special number issued to commemorate the tenth anniversary of his death. Freud had written a shorter paper on similar lines ten years earlier on the actual occasion of Popper's death (1923*f*). Some account of him can be found in an Editors' Note introducing that paper (*RSE*, **19**, 261). See also Freud's Preface to *Lynkeus' New State* (1939–40*a*), p. 277 below. For a fuller account of Freud's interest in him, see Wolf & Trosman (1974). The first pages of the present study give what is in fact a synopsis of the whole essence of Freud's psychological theory, written with characteristic clarity and precision.

MY CONTACT WITH JOSEF POPPER-LYNKEUS

It was in the winter of 1899 that my book on *The Interpretation of Dreams* (though its title page was post-dated into the new century) at length lay before me.[1] This work was the product of the labours of four or five years and its origin was unusual. Holding a lectureship in nervous diseases at the University,[2] I had attempted to support myself and my rapidly increasing family by a medical practice among the so-called 'neurotics' of whom there were only too many in our society. But the task proved harder than I had expected. The ordinary methods of treatment clearly offered little or no help: other paths must be followed. And how was it by any means possible to give patients help when one understood nothing of their illness, nothing of the causes of their sufferings or of the meaning of their complaints? So I eagerly sought direction and instruction from the great Charcot in Paris and from Bernheim at Nancy; finally, an observation made by my teacher and friend, Josef Breuer of Vienna, seemed to open a new prospect for understanding and therapeutic success. [219]

For these new experiments made it a certainty that the patients whom we described as neurotic were in some sense suffering from *mental* disturbances and ought therefore to be treated by psychological methods. Our interest therefore necessarily turned to psychology. The psychology which ruled at that time in the academic schools of philosophy had very little to offer and nothing at all for our purposes: we had to discover from the start both our methods and the theoretical hypotheses behind them. So I worked in this direction, first in collaboration with Breuer and afterwards independently of him. In the end I made it a part of my technique to require my patients to tell me without criticism whatever passed through their minds [*Sinn*], even if they were ideas [*Einfälle*][T] which did not seem to make sense or which it was distressing to report. [220]

1 [It seems to have been published on November 4, 1899. Cf. *RSE*, **4**, 11.]

2 [His appointment as Dozent dated from 1885. He was in Paris for the winter of 1885–6, and visited Nancy in 1889.]

When they fell in with my instructions they told me their dreams, among other things, as though they were of the same kind as their other thoughts. This was a plain hint that I should assign as much importance to these dreams as to other, intelligible, phenomena. They, however, were *not* intelligible, but strange, confused, absurd: like dreams, in fact – which, for that very reason, were condemned by science as random and senseless twitchings of the organ of the mind [*Seelenorgan*]T. If my patients were right – and they seemed only to be repeating the ancient beliefs held by unscientific men for thousands of years – I was faced with the task of 'interpreting dreams' [*Traumdeutung*]T in a way that could stand up against scientific criticism.

Seele

Deutung

To begin with, I naturally understood no more about my patients' dreams than the dreamers did themselves. But by applying to these dreams, and more particularly to my own dreams, the procedure which I had already used for the study of other abnormal psychological structures [*Bildungen*]T, I succeeded in answering most of the questions which could be raised by an interpretation of dreams. There were many such questions: What do we dream about? Why do we dream at all? What is the origin of all the strange characteristics which distinguish dreams from waking life? – and many more such questions besides. Some of the answers were easily given and turned out to confirm views that had already been put forward; but others involved completely new hypotheses with regard to the structure [*Aufbau*]T and functioning of the apparatus of the mind. People dream about the things that have engaged their minds during the waking day. People dream in order to allay impulses [*Regungen*]T that seek to disturb sleep, and in order to be able to sleep on. But why was it possible for dreams to present such a strange appearance, so confusedly senseless, so obviously contrasted with the content of waking thought, in spite of being concerned with the same material? There could be no doubt that dreams were only a substitute for a rational process of thought and could be interpreted – that is to say, translated [*übersetzen*]T into a rational process. But what needed explaining was the fact of the *distortion* which the dream-work had carried out upon the rational and intelligible material.

Übersetzung

[221] Dream distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations [*Bildungen*] and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully

self-contained unity. It is rather to be compared with a modern State in which a mob [*Masse*]^{T}, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious drives [*Triebe*]^{T} that are innate in our physical constitution. But these drives are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions [*Hemmungen*]^{T}, set themselves up against the direct manifestations of the drives. Every impulse in the nature of a wish [*Wunschregung*]^{T} that arises from the sources of drive energy [*Triebkräfte*] must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements – that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous sources of drives. We describe such impulses as being *repressed* [*verdrängt*]^{T} from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arises. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy [*Kräfteaufwand*], from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear [*Angst*]^{T}. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces [*Mächte*]^{T} (the

Regung

Verdrängung

[222]

dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful
Phantasie phantasy [*Wunschphantasie*][T] which lay behind the dream has turned into the manifest dream as we remember it – more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

I must apologize if I have hitherto talked so much about myself and my work on the problems of the dream; but it was a necessary preliminary to what follows. My explanation of dream distortion seemed to me new: I had nowhere found anything like it. Years later (I can no longer remember when) I came across Josef Popper-Lynkeus' book *Phantasien eines Realisten*.[1] One of the stories contained in it bore the title of 'Träumen wie Wachen' ['Dreaming like Waking'], and it could not fail to arouse my deepest interest. There was a description in it of a man who could boast that he had never dreamt anything nonsensical.
[223] His dreams might be fantastic, like fairy tales, but they were not enough out of harmony with the waking world for it to be possible to say definitely that 'they were impossible or absurd in themselves'. Translated into my manner of speech this meant that in the case of this man no dream distortion occurred; and the reason produced for its absence put one at the same time in possession of the reason for its occurrence. Popper allowed the man complete insight into the reasons for his peculiarity. He made him say: 'Order and harmony reign both in my thoughts and in my feelings, nor do the two struggle with each other. . . . I am one and undivided. Other people are divided and their two parts – waking and dreaming – are almost perpetually at war with each other.' And again, on the question of the interpretation of dreams: 'That is certainly no easy task; but with a little attention on the part of the dreamer himself it should no doubt always succeed. – You ask why it is

1 [*Phantasies of a Realist*, a collection of stories first published, like *The Interpretation of Dreams*, in 1899.]

that for the most part it does *not* succeed? In you other people there seems always to be something that lies concealed in your dreams, something unchaste [*Unkeusches*] in a special and higher sense, a certain secret quality [*Heimlichkeit*] in your being which it is hard to follow. And that is why your dreams so often seem to be without meaning or even to be nonsense. But in the deepest sense this is not in the least so; indeed, it cannot be so at all – for it is always the same man, whether he is awake or dreaming.'[1]

Now, if we leave psychological terminology out of account, this was the very same explanation of dream distortion that I had arrived at from my study of dreams. Distortion was a compromise, something in its very nature disingenuous, the product of a conflict between thought and feeling, or, as I had put it, between what is conscious and what is repressed. Where a conflict of this kind was not present and repression was unnecessary, dreams could not be strange or senseless. The man who dreamt in a way no different from that in which he thought while awake was granted by Popper the very condition of internal harmony which, as a social reformer, he aimed at producing in the body politic. And if science informs us that such a man, wholly without evil and [224] falseness and devoid of all repressions, does not exist and could not survive, yet we may guess that, so far as an approximation to this ideal is possible, it had found its realization in the person of Popper himself.

Overwhelmed by meeting with such wisdom, I began to read all his works – his books on Voltaire, on Religion, on War, on the Universal Provision of Subsistence, etc. – till there was built up clearly before my eyes a picture of this simple-minded, great man, who was a thinker and a critic and at the same time a kindly humanitarian and reformer. I reflected much over the rights of the individual which he advocated and to which I should gladly have added my support had I not been restrained by the thought that neither the processes of Nature nor the aims of human society quite justified such claims. A special feeling of sympathy drew me to him, since he too had clearly had painful experience of the bitterness of the life of a Jew and of the hollowness of the ideals of present-day civilization [*Kulturideale*]. Yet I never saw him in the flesh. He knew of me through common acquaintances, and I once had occasion to answer a letter from him in which he asked for some

1 [This passage is a portion of a much longer one quoted both in a footnote added in 1909 to *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 275 *n.* 2, and in Freud's earlier paper on Popper-Lynkeus (1923*f*), ibid., **19**, 264–5. There are some slight differences in the texts of the three versions, which have been disregarded here.]

piece of information.[1] But I never sought him out. My innovations in psychology had estranged me from my contemporaries, and especially from the older among them: often enough when I approached some man whom I had honoured from a distance, I found myself repelled, as it were, by his lack of understanding for what had become my whole life to me. And after all Josef Popper had been a physicist: he had been a friend of Ernst Mach. I was anxious that the happy impression of our agreement upon the problem of dream distortion should not be spoilt. So it came about that I put off calling upon him till it was too late and I could now only salute his bust in the gardens in front of our Rathaus.

1 [A letter from Freud to Popper, dated August 4, 1916, is included in Freud (1960*a*). Freud also contributed a brief appreciation of Popper as a Preface to Yisrael Doryon's *Lynkeus' New State*, Jerusalem, 1940 (Freud, 1939–40*a* [1938]). Cf. pp. 277 and 278 f. below.]

SÁNDOR FERENCZI

Sándor Ferenczi was born on July 16, 1873, and died on May 22, 1933. Freud's previous tribute to him, to which he refers here (Freud, 1923*i*), appears in *RSE*, **19**, 271 ff.

SÁNDOR FERENCZI

We have learnt by experience that wishing costs little; so we generously present one another with the best and warmest of wishes. And of these the foremost is for a long life. A well-known Eastern tale reveals the double-sidedness of precisely this wish. The sultan had his horoscope cast by two wise men. 'Thy lot is happy, master!' said one of them. 'It is written in the stars that thou shalt see all thy kinsmen die before thee.' This prophet was executed. 'Thy lot is happy!' said the other too, 'for I read in the stars that thou shalt outlive all thy kinsmen.' This one was richly rewarded. Both had given expression to the fulfilment of the same wish. [227]

It fell to me in January, 1926, to write an obituary of our unforgettable friend, Karl Abraham. A few years earlier, in 1923, I could congratulate Sándor Ferenczi on the completion of his fiftieth year. Today, scarcely a decade later, it grieves me that I have outlived him too. In what I wrote for his birthday I was able to celebrate openly his versatility and originality and the richness of his gifts; but the discretion imposed on a friend forbade my speaking of his lovable and affectionate personality, with its readiness to welcome everything of significance.

Since the days when he was led to me by his interest in psychoanalysis, still in its youth, we have shared many things with each other. I invited him to go with me to Worcester, Massachusetts, when in 1909 I was called upon to lecture there during a week of celebrations. In the morning, before the time had come for my lecture to begin, we would walk together in front of the University building and I would ask him to suggest what I should talk about that day. He thereupon gave me a sketch of what, half an hour later, I improvised in my lecture. In this way he had a share in the origin of the *Five Lectures*. Soon after this, at the Nuremberg Congress of 1910, I arranged that he should propose the organization of analysts into an international association – a scheme which we had thought out together. With slight modifications it was accepted and is in force to this day. For many successive years we spent

the autumn holidays together in Italy, and a number of papers that
[228] appeared later in the literature under his or my name took their first shape in our talks there. When the outbreak of the World War put an end to our freedom of movement, and paralysed our analytic activity as well, he made use of the interval to begin his analysis with me. This met with a break when he was called up for military service, but he was able to resume it later. The feeling of a secure common bond, which grew up between us from so many shared experiences, was not interrupted when, late in life unfortunately, he was united to the outstanding woman who mourns him today as his widow.

Ten years ago, when the *Internationale Zeitschrift* [and the *International Journal*] dedicated a special number to Ferenczi on his fiftieth birthday, he had already published most of the works which have made all analysts into his pupils. But he was holding back his most brilliant and most fertile achievement. I knew of it, and in the closing sentence of my contribution I urged him to give it to us. Then, in 1924, his *Versuch einer Genitaltheorie* appeared. This little book is a biological rather than a psychoanalytic study; it is an application of the attitudes and insights associated with psychoanalysis to the biology of the sexual processes and, beyond them, to organic life in general. It was perhaps the boldest application of psychoanalysis that was ever attempted. As its governing thought it lays stress on the conservative nature of the drives [*Triebe*]^{T}, which seek to re-establish every state of things that has been abandoned owing to an external interference. Symbols are recognized as evidence of ancient connections. Impressive instances are adduced to show how the characteristics of what is psychical preserve traces of primaeval changes in the bodily substance. When one has read this work, one seems to understand many peculiarities of sexual life of which one had never previously been able to obtain a comprehensive view, and one finds oneself the richer for hints that promise a deep insight into wide fields of biology. It is a vain task to attempt already today to distinguish what can be accepted as an authentic discovery from what seeks, in the fashion of a scientific phantasy [*Phantasie*]^{T}, to guess at future knowledge. We lay the little book aside with a feeling: 'This is almost too much to take in at a first reading; I will read it again after a while.' But it is not only I who feel like this.[1] It is probable that
[229] some time in the future there will really be a 'bioanalysis', as Ferenczi

1 [Freud makes no mention here of his own abandoned effort (1985*a* [1915]; *RSE*, **14**, 239 ff.) written earlier under Ferenczi's influence. The 'bioanalysis' prophesied below never materialized, except in the form of modern 'evolutionary psychology', which many contemporary scientists likewise dismiss as phylogenetic phantasy (e.g. Panksepp & Panksepp, 2000; Ellis & Solms, 2018).]

has prophesied, and it will have to cast back to the *Versuch einer Genitaltheorie*.

After this summit of achievement, it came about that our friend slowly drifted away from us. On his return from a period of work in America he seemed to withdraw more and more into solitary work, though he had previously taken the liveliest share in all that happened in analytic circles. We learnt that one single problem had monopolized his interest. The need to cure and to help had become paramount in him. He had probably set himself aims which, with our therapeutic means, are altogether out of reach today. From unexhausted springs of emotion the conviction was borne in upon him that one could effect far more with one's patients if one gave them enough of the love which they had longed for as children. He wanted to discover how this could be carried out within the framework of the psychoanalytic situation; and so long as he had not succeeded in this, he kept apart, no longer certain, perhaps, of agreement with his friends. Wherever it may have been that the road he had started along would have led him, he could not pursue it to the end. Signs were slowly revealed in him of a grave organic destructive process which had probably overshadowed his life for many years already. Shortly before completing his sixtieth year he succumbed to pernicious anaemia. It is impossible to believe that the history of our science will ever forget him.

The present translation is a very slightly revised reprint of the *SE* version.

This was a late, but not the last, contribution by Freud to his favourite topic of the psychopathology of everyday life (cf. Freud, 1901*b*), *RSE*, **6**. He returned to it once again in his 'Elementary Lessons' (1940*b* [1938]), ibid., **23**.

THE SUBTLETIES OF A FAULTY ACTION

I was preparing a birthday present for a woman friend[1] – a small engraved gem for insertion into a ring. It was fixed in the centre of a piece of stout cardboard and on this I wrote the following words: 'Voucher for the supply by Messrs L., jewellers, of a gold ring . . . for the attached stone bearing an engraved ship with sail and oars.' But at the point at which I have here left a gap, between 'ring' and 'for', there stood a word which I was obliged to cross out since it was entirely irrelevant. It was the little word '*bis*' [the German for 'till']. Why should I have written it at all? [233]

When I read the short inscription through, I was struck by the fact that it contained the word '*für*' ['for'] twice in rapid succession: '*for* the supply' – '*for* the attached stone'. That sounded ugly and should be avoided. It then occurred to me that '*bis*' had been substituted for '*für*' in an attempt to escape this stylistic awkwardness. No doubt that was so; but it was an attempt that made use of remarkably inadequate means. The preposition '*bis*' was quite out of place in this context and could not possibly be substituted for the necessary '*für*'. So why precisely '*bis*'?

But perhaps the word '*bis*' was not the preposition determining a time limit. It may have been something totally different – the Latin '*bis*' – 'for a second time', which has retained its meaning in French. '*Ne bis in idem*'[2] is a maxim of Roman law. '*Bis! bis!*' cries a Frenchman if he wants a performance repeated. So that must be the explanation of my senseless slip of the pen [*Verschreibens*][T]. I was being warned against the second '*für*', against a repetition of the same word. Something else must be put instead of it. The chance identity in sound between the foreign word '*bis*' which embodied the criticism of the original phraseology and the German preposition made it possible to insert '*bis*' instead of '*für*' [234]

1 [Ernest Jones (1957, 269) mistakenly identifies the friend as Lou Andreas-Salomé. In fact, she was Mrs Dorothy Burlingham, who was still in 1962 in possession of the ring and of the piece of cardboard to which the stone was attached.]

2 ['Do not institute the same proceedings twice.']

as though by a slip [*Irrtum*] of the pen. But this mistake [*Fehlleistung*][T] gained its purpose not by being *made*, but only after it had been *corrected*. I had to cross out the '*bis*' and in so doing I had myself, so to speak, done away with the repetition which was disturbing me. A variant, not without interest, of the mechanism of a parapraxis!

I felt very much pleased with this solution. But in self-analysis the danger of incompleteness is particularly great.[1] One is too soon satisfied with a part explanation, behind which resistance may easily be keeping back something that is more important perhaps. I related this little analysis to my daughter, and she immediately saw how it went on:

'But you gave her a stone like that for a ring once before. *That's* probably the repetition you want to avoid. One doesn't like always to be making the same present.' I was convinced by this; the objection was obviously to a repetition of the same *present*, not of the same *word*. There had been a displacement [*Verschiebung*][T] on to something trivial with the object of diverting attention from something more important: an aesthetic difficulty, perhaps, in place of a drive conflict [*Triebkonflikts*][T].

For it was easy to discover the further sequel. I was looking for a motive [*Motiv*][T] for not making a present of the stone, and that motive was provided by the reflection that I had already made the same (or a very similar) present. Why should this objection have been concealed and disguised? Very soon I saw clearly why. I wanted not to give the stone away at all. I liked it very much myself.

The explanation of this parapraxis was found without raising any great difficulties. Indeed, a consoling thought soon occurred to me: regrets of this kind only enhance the value of a gift. What sort of gift would it be if one were not a little bit sorry to part with it? Nevertheless, the episode enables one to realize once more how complicated the most
Seele unobtrusive and apparently simplest mental [*seelischen*][T] processes may
[235] be. I made a slip [*geirrt*] in writing out some instructions – put in a '*bis*' where a '*für*' was needed – I noticed it and corrected it: a small mistake [*Irrtum*], or rather attempt at a mistake, and yet based upon this large number of premises and dynamic determinants! Indeed, the mistake could not have occurred if the material had not been particularly favourable.

1 [The risk of incomplete interpretation had been insisted upon in the case of dreams in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 248, and **5**, 467 f. For the special difficulties in self-analysis, see a footnote to the 'History of the Psychoanalytic Movement' (1914*d*), ibid., **14**, 17 *n.* 1.]

A DISTURBANCE OF MEMORY ON THE ACROPOLIS

Romain Rolland was born on January 29, 1866, and this paper was dedicated to him on the occasion of his seventieth birthday. Freud had the greatest admiration for him, as is proved not only by the present work, but also by the message to Rolland on his sixtieth birthday (Freud, 1926*a*; *RSE*, **20**, 264) and by the six or seven letters to him which have been published (Freud, 1960*a*), as well as by a passage at the beginning of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 59–60. Freud had first corresponded with him in 1923, and had met him, for the only time, it seems, in 1924.

It has been impossible to trace any earlier publication of this paper in German, other than that in the *Almanach* noted above. It should be borne in mind that any publications connected with Romain Rolland, as with many other authors, including Thomas Mann and of course all Jewish writers, were suppressed during this period by the Nazis.

A DISTURBANCE OF MEMORY ON THE ACROPOLIS

An Open Letter to Romain Rolland on the Occasion of his Seventieth Birthday

My dear Friend, [239]

I have been urgently pressed to make some written contribution to the celebration of your seventieth birthday and I have made long efforts to find something that might in any way be worthy of you and might give expression to my admiration for your love of the truth, for your courage in your beliefs and for your affection and good will towards humanity; or, again, something that might bear witness to my gratitude to you as a writer who has afforded me so many moments of exaltation and pleasure. But it was in vain. I am ten years older than you and my powers of production are at an end. All that I can find to offer you is the gift of an impoverished creature, who has 'seen better days'.

You know that the aim of my scientific work was to throw light upon unusual, abnormal or pathological manifestations of the mind [*Seelenlebens*]^{T} – that is to say, to trace them back to the psychical forces [*Kräfte*]^{T} operating behind them and to indicate the mechanisms at work. I began by attempting this upon myself and then went on to apply it to other people and finally, by a bold extension, to the human race as a whole. During the last few years, a phenomenon of this sort, which I myself had experienced a generation ago, in 1904, and which I had never understood, has kept on recurring to my mind.[1] I did not at first see why; but at last I determined to analyse the incident – and I now present you with the results of that enquiry. In the process, I shall have, of course, to ask you to give more attention to some events in my private life than they would otherwise deserve. *Seele*

Every year, at that time, towards the end of August or the beginning of September, I used to set out with my younger brother on a holiday trip, which would last for some weeks and would take us to Rome or to some other region of Italy or to some part of the Mediterranean [240]

1 [Freud had made a short allusion to the episode some ten years earlier, in Chapter V of *The Future of an Illusion* (1927*c*), *RSE*, **21**, 23, but had not put forward the explanation.]

seaboard. My brother is ten years younger than me, so he is the same age as you – a coincidence which has only now occurred to me. In that particular year my brother told me that his business affairs would not allow him to be away for long: a week would be the most that he could manage and we should have to shorten our trip. So we decided to travel by way of Trieste to the island of Corfu and there spend the few days of our holiday. At Trieste he called upon a business acquaintance who lived there, and I went with him. Our host enquired in a friendly way about our plans and, hearing that it was our intention to go to Corfu, advised us strongly against it: 'What makes you think of going there at this time of year? It would be too hot for you to do anything. You had far better go to Athens instead. The Lloyd boat sails this afternoon; it will give you three days there to see the town and will pick you up on its return voyage. That would be more agreeable and more worthwhile.'

As we walked away from this visit, we were both in remarkably depressed spirits. We discussed the plan that had been proposed, agreed that it was quite impracticable and saw nothing but difficulties in the way of carrying it out; we assumed, moreover, that we should not be allowed to land in Greece without passports. We spent the hours that elapsed before the Lloyd offices opened in wandering about the town in a discontented and irresolute frame of mind. But when the time came, we went up to the counter and booked our passages for Athens as though it were a matter of course, without bothering in the least about the supposed difficulties and indeed without having discussed with one another the reasons for our decision. Such behaviour, it must be confessed, was most strange. Later on we recognized that we had accepted the suggestion that we should go to Athens instead of Corfu instantly and most readily. But, if so, why had we spent the interval before the offices opened in such a gloomy state and foreseen nothing but obstacles and difficulties?

When, finally, on the afternoon after our arrival, I stood on the
[241] Acropolis and cast my eyes around upon the landscape, a surprising thought suddenly entered my mind: 'So all this really *does* exist, just as we learnt at school!' To describe the situation more accurately, the person who gave expression to the remark was divided, far more sharply than was usually noticeable, from another person who took cognizance of the remark; and both were astonished, though not by the same thing. The first behaved as though he were obliged, under the impact of an unequivocal observation, to believe in something the reality of which had hitherto seemed doubtful. If I may make a slight exaggeration, it

was as if someone, walking beside Loch Ness, suddenly caught sight of the form of the famous Monster stranded upon the shore and found himself driven to the admission: 'So it really *does* exist – the sea serpent we've never believed in!' The second person, on the other hand, was justifiably astonished, because he had been unaware that the real existence of Athens, the Acropolis and the landscape around it had ever been objects of doubt. What he had been expecting was rather some expression of delight or admiration.

Now it would be easy to argue that this strange thought that occurred to me on the Acropolis only serves to emphasize the fact that seeing something with one's own eyes is after all quite a different thing from hearing or reading about it. But it would remain a very strange way of clothing an uninteresting commonplace. Or it would be possible to maintain that it was true that when I was a schoolboy I had *thought* I was convinced of the historical reality of the city of Athens and its history, but that the occurrence of this idea [*Einfall*]T on the Acropolis had precisely shown that in my unconscious I had *not* believed in it, and that I was only now acquiring a conviction that 'reached down to the unconscious'. An explanation of this sort sounds very profound, but it is easier to assert than to prove; moreover, it is very much open to attack upon theoretical grounds. No. I believe that the two phenomena, the depression at Trieste and the idea [*Einfall*] on the Acropolis, were intimately connected. And the first of these is more easily intelligible and may help us towards an explanation of the second.

The experience at Trieste was, it will be noticed, also no more than an expression of incredulity: 'We're going to see Athens? Out of the question! – it will be far too difficult!' The accompanying depression corresponded to a regret that it *was* out of the question: it would have [242]
been so lovely. And now we know where we are. It is one of those cases of 'too good to be true'[1] that we come across so often. It is an example of the incredulity that arises so often when we are surprised by a piece of good news, when we hear we have won a prize, for instance, or drawn a winner, or when a girl learns that the man whom she has secretly loved has asked her parents for leave to pay his addresses to her.

When we have established the existence of a phenomenon, the next question is of course as to its cause. Incredulity of this kind is obviously an attempt to repudiate a piece of reality; but there is something strange about it. We should not be in the least astonished if an attempt of this kind were aimed at a piece of reality that threatened to bring unpleasure

1 [In English in the original.]

[*Unlust*][T]: the mechanism of our mind is, so to speak, planned to work along just such lines. But why should such incredulity arise in something which, on the contrary, promises to bring a high degree of pleasure [*Lust*]? Truly paradoxical behaviour! But I recollect that on a previous occasion I dealt with the similar case of the people who, as I put it, are 'wrecked by success'.[1] As a rule people fall ill as a result of frustration [*Versagung*][T], of the non-fulfilment of some vital necessity or desire. But with these people the opposite is the case; they fall ill, or even go entirely to pieces, because an overwhelmingly powerful wish of theirs has been fulfilled. But the contrast between the two situations is not so great as it seems at first. What happens in the paradoxical case is merely that the place of the external frustration is taken by an internal one. The sufferer does not permit himself happiness: the internal frustration commands him to cling to the external one. But why? Because – so runs the answer in a number of cases – one cannot expect Fate [*Schicksal*][T] to grant one anything so good. In fact, another instance of 'too good to be true', the expression of a pessimism of which a large portion seems to find a home in many of us. In another set of cases, just as in those who are wrecked by success, we find a sense of guilt or inferiority, which can be translated: 'I'm not worthy of such happiness, I don't deserve it.' But these
Motiv two motives [*Motivierungen*][T] are essentially the same, for one is only a
[243] projection of the other. For, as has long been known, the Fate which we expect to treat us so badly is a materialization of our conscience, of the severe superego [*Über-Ichs*][T] within us, itself a residue of the punitive agency of our childhood.[2]

This, I think, explains our behaviour in Trieste. We could not believe that we were to be given the joy of seeing Athens. The fact that the piece of reality that we were trying to repudiate was to begin with only a *possibility* determined the character of our immediate reactions. But when we were standing on the Acropolis the possibility had become an actuality, and the same disbelief found a different but far clearer expression. In an undistorted form this should have been: 'I could really not have imagined it possible that I should ever be granted the sight of Athens with my own eyes – as is now indubitably the case!' When I recall the passionate desire to travel and see the world by which I was dominated at school and later, and how long it was before that desire began to find its fulfilment, I am not surprised at its after-effect on the Acropolis; I was then forty-eight years old. I did not ask my younger brother whether he felt anything of the same sort. A certain amount of

1 [Section II of 'Some Character-Types Met with in Psychoanalytic Work' (1916*d*), *RSE*, **14**, 320 ff.]

2 [Cf. Chapter VII of *Civilization and its Discontents* (1930*a*), ibid., **21**, 113–14.]

reserve surrounded the whole episode; and it was this which had already interfered with our exchanging thoughts at Trieste.

If I have rightly guessed [*erraten*][T] the meaning of the thought [*Einfalls*] that came to me on the Acropolis and if it did in fact express my joyful astonishment at finding myself at that spot, the further question now arises why this meaning should have been subjected in the thought [*Einfall*] itself to such a distorted and distorting disguise.

The essential subject matter of the thought [*Gedankens*], to be sure, was retained even in the distortion – that is, incredulity: 'By the evidence of my senses I am now standing on the Acropolis, but I cannot believe it.' This incredulity, however, this doubt of a piece of reality, was doubly displaced [*verschoben*][T] in its actual expression: first, it was shifted back into the past, and secondly it was transposed from my relation to the Acropolis on to the very existence of the Acropolis. And so something occurred which was equivalent to an assertion that at some time in the past I had doubted the real existence of the Acropolis – which, however, my memory rejected as being incorrect and, indeed, impossible. *Verschiebung*

The two distortions involve two independent problems. We can attempt to penetrate deeper into the process of transformation. Without for the moment particularizing as to how I have arrived at the idea, I will start from the presumption that the original factor must have been a sense of some feeling of the unbelievable and the unreal in the situation at the moment. The situation included myself, the Acropolis and my perception of it. I could not account for this doubt; I obviously could not attach the doubt to my sensory impressions of the Acropolis. But I remembered that in the past I had had a doubt about something which had to do with this precise locality, and I thus found the means for shifting the doubt into the past. In the process, however, the subject matter of the doubt was changed. I did not simply recollect that in my early years I had doubted whether I myself would ever see the Acropolis, but I asserted that at that time I had disbelieved in the reality of the Acropolis itself. It is precisely this effect of the distortion that leads me to think that the actual situation on the Acropolis contained an element of doubt of reality. I have certainly not yet succeeded in making the process clear; so I will conclude by saying briefly that the whole psychical situation, which seems so confused and is so difficult to describe, can be satisfactorily cleared up by assuming that at the time I had (or might have had) a momentary feeling: '*What I see here is not real*.' Such a feeling is known as a 'feeling [244]

of derealization' ['*Entfremdungsgefühl*'].[1] I made an attempt to ward that feeling off, and I succeeded, at the cost of making a false pronouncement about the past.

These derealizations are remarkable phenomena which are still little understood. They are spoken of as 'sensations', but they are obviously complicated processes, attached to particular mental contents and bound up with decisions made about those contents. They arise very frequently in certain mental diseases, but they are not unknown among normal people, just as hallucinations occasionally occur in the healthy. Nevertheless, they are certainly failures in functioning[2] and, like dreams, which, in spite of their regular occurrence in healthy people, serve us
[245] all as models of psychological disorder, they are abnormal structures [*Aufbau*][T]. These phenomena are to be observed in two forms: the subject feels either that a piece of reality or that a piece of his own self [*Ichs*][T] is strange to him. In the latter case we speak of 'depersonalizations'; derealizations and depersonalizations are intimately connected. There is another set of phenomena which may be regarded as their positive counterparts – what are known as '*fausse reconnaissance*', '*déja vu*', '*déjà raconté*', etc.,[3] illusions in which we seek to accept something as belonging to our ego, just as in the derealizations we are anxious to keep something out of us. A naively mystical and unpsychological attempt at explaining the phenomena of '*déjà vu*' endeavours to find evidence in it of a former existence of our mental self [*Ichs*]. Depersonalization leads us on to the extraordinary condition of '*double conscience*',[4] which is more correctly described as 'split personality'. But all of this is so obscure and has been so little mastered scientifically that I must refrain from talking about it any more to you.

It will be enough for my purposes if I return to two general characteristics of the phenomena of derealization. The first is that they all serve the purpose of defence [*Abwehr*][T]; they aim at keeping something
Verleugnung away from the ego, at disavowing [*verleugnen*][T] it. Now, new elements, which may give occasion for defensive measures, approach the ego from two directions – from the real external world and from the

1 [The word has been rendered variously into English. Henderson & Gillespie, *Text-Book of Psychiatry* (fifth edition, 1940, 102), use the term 'derealization', and make the same distinction as Freud between it and 'depersonalization' (Freud's term for the latter is '*Depersonalisation*').]

2 ['*Fehlleistungen*.' This term is usually translated 'parapraxes' in the *RSE*.][T]

3 [Freud discussed these phenomena twice at some length: in Chapter XII (D) of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 227 ff., and in a paper on 'Fausse Reconnaissance' (1914*a*), ibid., **13**, 195 ff. Cf. also the 'Wolf Man's' 'veil' (1918*b*), ibid., **17**, 67 and 89 ff.]

4 [The French term means 'dual consciousness'.]

internal world of thoughts and impulses [*Regungen*][T] that emerge in the ego. It is possible that this alternative coincides with the choice between derealizations proper and depersonalizations. There are an extraordinarily large number of methods (or mechanisms, as we say) used by our ego in the discharge of its defensive functions. An investigation is at this moment being carried on close at hand which is devoted to the study of these methods of defence: my daughter, the child analyst, is writing a book upon them.[1] The most primitive and thoroughgoing of these methods, 'repression' ['*Verdrängung*'][T], was the starting point of the whole of our deeper understanding of psychopathology. Between repression and what may be termed the normal method of fending off [246] what is distressing or unbearable, by means of recognizing it, considering it, making a judgement upon it and taking appropriate action about it, there lie a whole series of more or less clearly pathological methods of behaviour on the part of the ego. May I stop for a moment to remind you of a marginal case of this kind of defence? You remember the famous lament of the Spanish Moors '*Ay de mi Alhama*' ['Alas for my Alhama'], which tells how King Boabdil[2] received the news of the fall of his city of Alhama. He feels that this loss means the end of his rule. But he will not 'let it be true', he determines to treat the news as '*non arrivé*'.[3] The verse runs:

> 'Cartas le fueron venidas
> que Alhama era ganada:
> las cartas echo en el fuego,
> y al mensajero matara.'[4]

It is easy to guess that a further determinant of this behaviour of the king was his need to combat a feeling of powerlessness. By burning the letters and having the messenger killed he was still trying to show his absolute power.

The second general characteristic of the derealizations – their dependence upon the past, upon the ego's store of memories and upon earlier distressing experiences which have since perhaps fallen victim to repression – is not accepted without dispute. But precisely my own

1 [Anna Freud, *The Ego and the Mechanisms of Defence* (1936).]

2 [The last Moorish King of Granada at the end of the fifteenth century. Alhama, some twenty miles distant, was the key fortress to the capital.]

3 [Freud used the same phrase to describe the defensive process in Section I of his first paper on 'The Neuropsychoses of Defence' (1894*a*), *RSE*, **3**, 46, and again in Chapter VI of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 106 f.]

4 ['Letters had reached him telling that Alhama was taken. He threw the letters in the fire and killed the messenger.']

experience on the Acropolis, which actually culminated in a disturbance of memory and a falsification of the past, helps us to demonstrate this connection. It is not true that in my schooldays I ever doubted the real existence of Athens. I only doubted whether I should ever see Athens. It seemed to me beyond the realms of possibility that I should travel so far – that I should 'go such a long way'. This was linked up
[247] with the limitations and poverty of our conditions of life in my youth. My longing to travel was no doubt also the expression of a wish to escape from that pressure, like the force which drives so many adolescent children to run away from home. I had long seen clearly that a great part of the pleasure of travel lies in the fulfilment of these early wishes – that it is rooted, that is, in dissatisfaction with home and family. When first one catches sight of the sea, crosses the ocean and experiences as realities cities and lands which for so long had been distant, unattainable things of desire – one feels oneself like a hero who has performed deeds of improbable greatness. I might that day on the Acropolis have said to my brother: 'Do you still remember how, when we were young, we used day after day to walk along the same streets on our way to school, and how every Sunday we used to go to the Prater or on some excursion we knew so well? And now, here we are in Athens, and standing on the Acropolis! We really *have* gone a long way!' So too, if I may compare such a small event with a greater one, Napoleon, during his coronation as Emperor in Notre Dame,[1] turned to one of his brothers – it must no doubt have been the eldest one, Joseph – and remarked: 'What would *Monsieur notre Père* have said to this, if he could have been here today?'

But here we come upon the solution to the little problem of why it was that already at Trieste we interfered with our enjoyment of the voyage to Athens. It must be that a sense of guilt was attached to the satisfaction in having gone such a long way: there was something about it that was wrong, that from earliest times had been forbidden. It was something to do with a child's criticism of his father, with the undervaluation which took the place of the overvaluation of earlier childhood. It seems as though the essence of success was to have got further than one's father, and as though to excel one's father was still something forbidden.

As an addition to this generally valid motive there was a special factor present in our particular case. The very theme of Athens and the Acropolis in itself contained evidence of the son's superiority. Our

1 [The story is usually told of his assumption of the Iron Crown of Lombardy in Milan.]

father had been in business, he had had no secondary education, and Athens could not have meant much to him. Thus what interfered with our enjoyment of the journey to Athens was a feeling [*Regung*] of *filial piety*. And now you will no longer wonder that the recollection of this incident on the Acropolis should have troubled me [*mich . . . heimsucht*][t] so often since I myself have grown old and stand in need of forbearance and can travel no more. [248]

I am ever sincerely yours,

SIGM. FREUD

PREFACE TO RICHARD STERBA'S *DICTIONARY OF PSYCHOANALYSIS*[1]

(1936 [1932])

July 3, 1932

[253]

Dear Dr Sterba, your *Dictionary* gives me the impression of being a valuable aid to learners and of being a fine achievement on its own account. The precision and correctness of the individual entries is in fact of commendable excellence. English and French translations of the headings are not indispensable but would add further to the value of the work.[2] I do not overlook the fact that the path from the letter A to the end of the alphabet is a very long one, and that to follow it would mean an enormous burden of work for you. So do not do it unless you feel an internal obligation – only obey a compulsion of *that* kind and certainly not any external pressure.

Yours sincerely,

FREUD

1 [Printed in facsimile as frontispiece to the first instalment ('Abasie' to 'Angst') of Sterba's *Handwörterbuch der Psychoanalyse*, Vienna, 1936. Reprinted in *GW*, **Nachtr.**, 761. The translation is by James Strachey and was first published in *SE*, **22**, 253. The letter was written when the work had only just been started and when Freud had seen only a sample of it.]

2 [These were, in fact, included in the finished work.]

PREFACE TO MARIE BONAPARTE'S *THE LIFE AND WORKS OF EDGAR ALLAN POE: A PSYCHO-ANALYTIC INTERPRETATION*[1]

(1933)

[254] In this volume my friend and pupil, Marie Bonaparte, has directed the light of psychoanalysis upon the life and work of a great writer of a pathological type. Thanks to her interpretative efforts, we can now understand how much of the characteristics of his work were determined by their author's special nature; but we also learn that this was itself the precipitate of powerful emotional ties and painful experiences in his early youth. Investigations of this kind are not intended to explain an author's genius, but they show what motives [*Motive*]T aroused it and what material was offered to him by destiny [*Schicksal*]T. There is a particular fascination in studying the laws of the human mind *Seele* [*Seelenlebens*]T as exemplified in outstanding individuals.

1 [First published (in French) in Marie Bonaparte's *Edgar Poe, étude psychanalytique*, Paris, 1933, **1**, xi. German original in *Edgar Poe, eine psychoanalytische Studie*, Vienna, 1934, v. Reprinted *GS*, **12** (1934), 391, and *GW*, **16** (1950), 276. English translation (by John Rodker) in *The Life and Works of Edgar Allan Poe: A Psycho-Analytic Interpretation*, London, 1949, xi. The present translation, slightly revised here, was first published in *SE*, **22**, 254, by James Strachey.]

INTRODUCTORY NOTE TO SACHS'S *PSYCHOANALYSIS: ITS MEANING AND PRACTICAL APPLICATIONS*[1]

(1934 [1933])

These chapters constitute an instructive [*Lehrreich*] and valuable introduction to the science of psychoanalysis, which is so difficult to present.

FREUD

Vienna, April 2, 1933

1 [This brief endorsement of Wulf Sachs's *Psychoanalysis: Its Meaning and Practical Applications* (London, 1934) was first published in English under the title 'Introductory Note by Professor Freud' (p. v). It has never been reprinted. The endorsement was evidently penned in German, as the unnamed translator left the word '*Lehrreich*' in brackets. Sachs (1893–1949) is best known for his ethno-psychoanalytic study *Black Hamlet* (1937) and was President of the shortlived South African Psychoanalytical Society (see Freud, 1935*a*; *RSE*, **20**, 65).]

LETTER ON HOMOSEXUALITY[1]

(1951 [1935])

April 9, 1935
Vienna

Dear Mrs ——

I gather from your letter that your son is a homosexual. I am most impressed by the fact that you do not mention this term yourself in your information about him. May I question you, why you avoid it? Homosexuality is assuredly no advantage, but it is nothing to be ashamed of, no vice, no degradation, it cannot be classified as an illness; we consider it to be a variation of the sexual function produced by a certain arrest of sexual development. Many highly respectable individuals of ancient and modern times have been homosexuals, several of the greatest men among them (Plato, Michelangelo, Leonardo da Vinci, etc.). It is a great injustice to persecute homosexuality as a crime, and cruelty too. If you do not believe me, read the books of Havelock Ellis.

By asking me if I can help, you mean, I suppose, if I can abolish homosexuality and make normal heterosexuality take its place. The answer is, in a general way, we cannot promise to achieve it. In a certain number of cases we succeed in developing the blighted germs of heterosexual tendencies which are present in every homosexual, in the majority of cases it is no more possible. It is a question of the quality and the age of the individual. The result of treatment cannot be predicted.

What analysis can do for your son runs in a different line. If he is unhappy, neurotic, torn by conflicts, inhibited in his social life, analysis may bring him harmony, peace of mind, full efficiency, whether he

1 [In April 1935 a despairing mother wrote to Freud from America, seeking his advice regarding her son. She anonymously sent Freud's reply to Dr Alfred Kinsey, with the covering note: 'Herewith I enclose a letter from a great and good man which you may retain. – From a Grateful Mother'. The letter was published under the present title in the *American Journal of Psychiatry*, **107** (1951), 786. It was reprinted in *Int. J. Psycho-Anal.*, **32** (1951), 331, and in Jones's biography (1957, 208). The original letter was written in English. In this letter Freud restates the views he expressed in his (1905*h*) Statement on Homosexuality and two *Rundbriefe* from the early 1920s (*RSE*, **7**, 313 and 311–12).]

remains a homosexual or gets changed. If you make up your mind he should have analysis with me – I don't expect you will – he has to come over to Vienna. I have no intention of leaving here.

However, don't neglect to give me your answer.

Sincerely yours with kind wishes,

FREUD

PS. I did not find it difficult to read your handwriting. Hope you will not find my writing and my English a harder task.

TO THOMAS MANN ON HIS SIXTIETH BIRTHDAY[1]

(1935)

[255] My dear Thomas Mann, accept as a friend my affectionate greetings on your sixtieth birthday. I am one of your 'oldest' readers and admirers and I might wish you a very long and happy life as is the custom on such occasions. But I shall not do so. Wishing is cheap and strikes me as a relapse into the days when people believed in the magical omnipotence of thoughts. I think, too, from my most personal experience, that it is well if a compassionate fate sets a timely end to the length of our life.[2]

Nor do I think the practice deserves imitation by which affection on these festive occasions disregards respect, and by which the subject of the celebration is compelled to hear himself loaded with praise as a man and analysed and criticized as an artist. I shall not be guilty of such presumption. I can allow myself something else however. In the name of a countless number of your contemporaries I can express to you our confidence that you will never do or say – for an author's words are deeds – anything that is cowardly or base. Even in times and circumstances that perplex the judgement you will take the right path and point it out to others.

Yours very sincerely,

FREUD

June, 1935

1 [This was probably first published in the autumn of 1935 in *Almanach 1936*, 18. Reprinted in *GW*, **16** (1950), 249. Translated (by T. & J. Stern) in *Letters of Sigmund Freud 1873–1939*, New York, 1960, 426, and London, 1961, 422. The present translation is by James Strachey, and was first published in *SE*, **22**, 255. This, Freud told Arnold Zweig, was written at the request of Mann's publishers, the S. Fischer Verlag, as part of a sixtieth birthday tribute, but it has been impossible to trace any publication of the letter before that in the *Almanach 1936*. See, however, the Editors' remarks in connection with Romain Rolland on p. 253 above. Thomas Mann was an enthusiastic admirer of Freud's and wrote many appreciations of him. A long letter from Freud to Mann on the subject of Napoleon, written a year after the present one (November 29, 1936), is included in the volume of letters quoted above and also in Jones's biography (1957, 492–3).]

2 [Freud himself was 79 at this date.]

LETTER TO THE SOCIETY OF B'NAI B'RITH, VIENNA[1]

(1935)

Dear Brethren:

The most honourable Grand President, who occasionally visits me in my seclusion, has let me know that you are celebrating the fortieth anniversary of the foundation of the lodge. This gives me cause to remember you and to convey my sincere good wishes.

I was not actually part of it from the outset, I joined about one and a half years later – recruited by Dr Edmund Kohn,[2] who has no doubt remained unforgettable to all of you. The first person I came across in the young 'Vienna' was my old friend Wilhelm Knöpfmacher, with whom I stayed awake the night before our Matura in an effort to shore up possible weak points in our preparation.

I soon became one of you: I enjoyed your support [*Sympathien*], almost never missed an opportunity to visit the place where one could be sure to find friends in a generally hostile environment, delivered lectures before you,[3] took the floor often enough during our fraternal dinners, and savoured contact with the many benevolent, quick-witted and learned men one found assembled at the 'Vienna'. This continued for many years until inundation with work, the disorder brought about by the war, and ultimately serious illness, gradually forced me out of what had become a cosy circle.

Before that, I contributed another friend, who was later elected President: Leopold Königstein.[4]

However, even since I stopped attending your meetings, the sense of belonging with you has not abated. It has kept alive the far-reaching

1 ['Brief an B'nai B'rith (Wien)'. *B'nai B'rith Mitteilungen für Österreich*, **35** (9/10), 193. The present translation, the first into English, is by Mark Solms.]

2 [The Vienna branch lodge of the Society, affectionately abbreviated the 'Vienna', was founded on October 13, 1895. Freud joined on September 29, 1897. Edmund Kohn (1863–1929) was a Viennese gynaecologist.]

3 [See Editors' Note to Freud (1926*j*), *RSE*, **20**, 257, for a listing of some of these lectures.]

4 [Freud introduced at least two other members: Oscar Rie and Eduard Hitschmann. See Klein (1985) for a detailed account of Freud's relationship with the Society of B'nai B'rith.]

consensus of cultural and humanitarian ideals, as well as the (equally pleasant) affirmation of being Jewish and of Jewish origin.

There is nothing more to be done for me; I am nearly twice as old as our 'Vienna'. But with you, a Society which can always be rejuvenated once more, our community will keep faith.

With sincere good wishes, in *W. B. & E.*[1]

Your

1 [*Wohlwollen, Bruderliebe und Eintracht*, the motto of the Society, translated 'Benevolence, Brotherly Love and Harmony'.]

DEATH OF PROFESSOR BRAUN[1]

(1936)

You want an appreciation from me of the recently deceased Professor Ludwig Braun. I am not suited to that task; I cannot be objective, for this man, who was outstanding in more than one respect, was one of my closest and warmest friends. There was something fateful about our relationship. An older cousin of his, Heinrich Braun, was my most intimate comrade during the Gymnasium [grammar school] years, before events compelled us to take divergent paths in life.[2] Then over the last decades Ludwig Braun became my confidant, and temporarily my doctor, without my knowing of any relationship. Our intimacy no doubt rested upon the sense of many internal commonalities.

SIGMUND FREUD

1 [First published in the *Mitteilungsblatt der Vereinigung jüdischer Ärzte* (May, 1936), No. 29, p. 6. Reprinted in *GW*, **Nachtr.**, 735. The present translation, by Mark Solms, is the first into English. – Ludwig Braun (1861–1936) was a well-known Viennese cardiologist and a close friend of Freud's. See the Editors' Note to Freud (1926*j*), *RSE*, **20**, 257.]

2 [Heinrich Braun became a leading figure in the Social-Democratic movement. See Freud (1925*d*), ibid., **20**, 6.]

LETTER TO ALBERT EINSTEIN[1]

(1957 [1936])

May 3, 1936
Vienna

Dear Einstein,

You struggle in vain against my replying to your kind letter.[2] I have to tell you how much the change in your judgement – or the beginning of a change – delighted me. Of course I have always known that you admired me only 'out of politeness' but believed very few among all my claims. However, I have often asked myself what there actually is to be admired in them if they are not true, that is, if they do not contain a large degree of truth. By the way, do you not think that I would have been better treated if the composition of my teachings had included a greater percentage of error and lunacy?

You are so much younger than me; I dare hope that you will be a follower of mine by the time you reach my age. Since I shall not experience it then, I am anticipating now the gratification of it (you know what I have in mind: *Im Vorgefühl von solchem hohen Glück geniess' ich*,[3] etc.)

With heartfelt devotion and steadfast respect,

Your

SIGM. FREUD

1 [First published in English translation by Ernest Jones, *Sigmund Freud: Life and Work*, **3** (1957), 217 f.; retranslated by Tania & James Stern in *Letters of Sigmund Freud* (1960), 428. The present translation is a new one by Mark Solms. The original text was first published in the German edition of Jones's biography: *Das Leben und Werk von Sigmund Freud*, **3** (1962), 243; and reprinted in the German edition of Freud's *Briefe* (1960), 443.]

2 [Einstein wrote on April 21, 1936, that he recently had an opportunity of forming an independent judgement on the theory of repression, which he had previously admired only for its 'speculative power'. He concluded with the words: 'it is always delightful when a great and beautiful conception proves to be consonant with reality', but begged Freud not to reply.]

And now enjoy the highest moment's bliss.' – (*Faust*, Act V.)]

PREFACE TO YISRAEL DORYON'S *LYNKEUS' NEW STATE*[1]

(1939–40 [1938])

The Jew Josef Popper-Lynkeus – researcher, thinker and philanthropist – will surely be recognized and honoured by future generations as one of the very great men of his time. During the very brief period of its rule in Vienna, the Socialist city council had dedicated a bust to his memory in the Vienna Rathaus gardens. When the Germans invaded Vienna this monument was removed, probably destroyed. Mr Doryon's book is a first attempt to erect it once more.

SIGM. FREUD

London, November, 1938

1 [This Preface was published in German (with a Hebrew translation) in Yisrael Doryon's *Lynkeus' New State: A Plan for the Establishment of a New Social Order on an Improved and Humane Basis*, Jerusalem, Rubin Mass, 1939. The book contained a second preface by Albert Einstein. It was reprinted (with a facsimile of Freud's handwritten text) in Yisrael Doryon's *Ha-Isch Mosche* (*Der Mann Moses*), Jerusalem, Massada Publishing Co., 1945–6. The original German text was reprinted again in *GW*, **Nachtr.**, 784. Doryon's book also contains a short letter which accompanied the Preface, as well as extracts from two further letters from Freud to Doryon. An English translation of these appears below. The original German was likewise reprinted in *GW*, **Nachtr.**, 786–8. This English translation is by Mark Solms. For more details, see the Editors' Note to Freud (1923*f*), *RSE*, **19**, 261, and Freud's own account of his contact with Popper-Lynkeus (p. 231 ff. above).]

EXTRACTS FROM TWO LETTERS TO YISRAEL DORYON[1]

(1945–46 [1938])

Oct. 7, 1938

[. . .]

Your letter was of great interest to me. You probably know of my great admiration for Popper-Lynkeus. It would not bother me at all if he inspired my claim that Moses was an Egyptian. Phenomena of so-called cryptomnesia have very frequently occurred with me, and have clarified the origins of apparently original ideas.

I take it that Popper-Lynkeus' piece, 'Der Sohn des Königs von Ägypten' ['The Son of the King of Egypt'], really applies to Moses. I cannot check this, because the *Phantasien eines Realisten* [see p. 277 *n.* above] somehow did not survive the move of my library to London. I can't find it, and must first acquire another copy.

I no doubt read the essay at that time, perhaps even more than once. Whether or not I have retained an impression of it, I cannot say. I was not interested in the question [of Moses] at the time that I read the book. There really is quite a story to the claim that Moses was an Egyptian. One cannot say that it was an 'insight' ['*Einfall*'][T] of mine. On the contrary, it has often been expressed, always without a shred of evidence. I therefore ignored all these instances in my small treatise. Last year, when it was already submitted for printing, I found, to my surprise, the same proposition in the notorious *Grundlagen des XIX. Jahrhunderts* ['The Foundations of the Nineteenth Century'] by Houston Chamberlain[2] [1899]. I also recalled a historical novel which I

1 [For the bibliographical details of these extracts, which accompanied Freud's Preface to Doryon's *Lynkeus' New State* (1939–40*a* [1938]), see the Editors' footnote to the Preface above (p. 277 *n.*). The Preface was also accompanied by this short letter: 'Dear Mr Doryon, Attached are a few words to introduce your book. With my best wishes. Respectfully yours, Sigm. Freud.' The translation into English is by Mark Solms.]

2 [Houston Stewart Chamberlain (1855–1926), an erudite political theorist, notorious for his racist views, was regarded as an intellectual ancestor of the National Socialist ideology. His *Grundlagen des XIX. Jahrhunderts* was published in the same year, 1899, as Popper's *Phantasien eines Realisten*. The irony of the claim that Freud had been influenced by Chamberlain rather than by Popper would not have escaped Yisrael Doryon.]

came across, before my [1937*b*] work, in which Moses was portrayed as a direct pupil of the Pharaoh, his cousin. However, I could no longer find this novel, which perhaps really did influence me.

You see that I cannot answer with certainty the question as to whether Popper-Lynkeus' phantasy had a part in my small work. Naturally, I consciously approached the problem in a different, specific way. What is new in my work is not the conclusion [that Moses was an Egyptian], but rather the little piece of psychoanalytical confirmation of it, which, admittedly, will impress only a few.

[. . .]

Oct. 25, 1938

[. . .]

The reading of the piece [by Popper-Lynkeus] aroused no recollection in me, but naturally there is no proof in that. I see that Popper-Lynkeus modified the myth of Moses from the model of the type: the father who is warned before the birth of the son, by dream, oracle and presentiment, and therefore seeks to prevent his birth or (and) abandons the child after birth. In that respect, he and I are far apart. For me, the essential thing is the negation [*Negation*]. Moses is as little the child of his Jewish elders as was Cyrus the grandchild of the Median king, or Romulus that of the King of Alba Longa. In all such cases the first family in the myth is the fictive one. Thus Moses is not half but rather completely Egyptian.

I agree without reservation with your opinion of Popper-Lynkeus. I am not in a position to appreciate his versatility, but I, too, consider him to be one of the greatest men of his time and I am pleased by your undertaking to pay homage to him.

[. . .]

GENERAL INDEX

Abraham, *K.* (*see also* Bibliography), 22, 46–7, 87–8, 241
Abstract ideas represented in dreams, 18–19, 21
Acropolis, the, 255–63
Active and passive, 85, 101–3, 106, 113, 116, 178–83, 188–91
Adler, *A.*, 58, 123–6
Aesthetic ideals and war, 224–5
Affect
  anxiety as, 72, 75
  in dreams, 19
  quota of, 19, 74
Aggression, internalized, 221, 224
  conscience as, 96, 221
Aggressive drives (*see also* Destructive drive), 91–8, 179–80, 210, 213, 219–20
Aggressiveness, 156, 157, 158, 203, 219–22, 223–4
  in females, 101–6, 109
  in males, 101, 109, 116
Agoraphobia, 74–5
Aichhorn, *A.* (*see also* Bibliography), 129 *n.* 2, 132 *n.* 1
Akhenaten, 225 *n.* 1
Alexander the Great, 90
Alexander, *F.* (*see also* Bibliography), 24
Alhama, fall of, 261 and *nn.* 2 & 4
Alone, fear of being, 73
Ambition
  and urethral erotism, 90, 200
  in women, 118
Ambivalence, 88, 106, 109, 117–18, 191–2
America, 20–1, 123–4, 126, 127, 241, 243, 270
Amnesia, infantile, 26
Amphictyonic Council, 218
Anal (*see also* Sadistic-anal phase)
  birth, 23, 89
  character, 90
  erotism, 88–90
  impulses, 87–8
Analogies
  alkali in mother-liquor, 11
  'bewitched' as diagnosis, 124–5
  breaking a crystal, 52
  conjurer and pigeon-breeding, 32
  core of the earth, 28–9
  draining Zuider Zee, 71
  driver and traffic regulations, 150
  'eat or be eaten', 98
  elected representatives, 11
  garrison into rebellious regions, 98
  general shifting figures on a map, 79
  inoculation against diphtheria, 131
  mixed population, 65
  mob and ruling class, 233
  pillory in the Middle Ages, 121
  'primitive' language, 18
  rider and horse, 69
  sculptor and clay model, 153
  stream dividing into channels, 190
  witches, detection of, 137
Anarchism, 151, 154–5
Andamans, aborigines of the, 201 *n.* 3
Andreas-Salomé, *L.* (*see also* Bibliography), 89, 249 *n.* 1
Animals
  as gods, 143, 146
  behaviour of, 49, 101, 215
  instinct/drive in, 91, 94
Animism, 108, 144–7

Anna O., Fräulein, case of (*see* Case of *Fräulein Anna O.*)
Anticathexis, 80 and *n.* 1
Anti-Semitism, 235, 253
Anus and primitive mouth, 88
'Anxiety, conscience', 55 *n.* 1
Anxiety, moral, 55, 69–70, 76, 78
Anxiety, neurotic (*see also* Fear; Fright at castration; Phobias), 4, 69–70, 72–6, 79, 82–4, 106, 125
  and birth trauma, 72, 77–8, 83, 126
  and expectation, 73–4
  and repression, 74, 76–7, 79–82, 83
  and separation from mother, 77–8
  as affect, 72, 75
  as transformed libido, 73–5, 84 *n.* 1
  theory of libidinal causation dropped, 81, 83–4
Anxiety, realistic, 4, 55, 69–70, 72–3, 75–7, 82–4
Anxiety attacks, 74, 80
Anxiety dreams, 8, 16, 25–7, 233
Anxiety hysteria, 76
Anxiety neurosis, 73–4, 83–4
Anxiety of the id, 75
Archaic
  character of dreams, 17–19
  communication, telepathy as, 49
Archimedes, 152
Ariadne's thread, myth of, 23
Aristarchus of *Samos*, 152
Aristotle, 15
Art and science, 141
Artemis, Temple of, 90
Association of ideas (*see* Free association)
Astronomy, 6, 21, 152
Athens, 255–63
Attention, distraction of, 36 *n.* 1
Automatic actions, 36 *n.* 1

Babylonians, the, 152
Bedouin bridal ceremonial, 22
Bennett, A., 43
Berlin, 65 *n.* 1, 210
  Psychoanalytic Institute, 134
Bernays, Martha (see also *Freud, Martha*), 141 *n.* 1
Bernheim, H., 231
Betlheim, S. (*see also* Bibliography), 21
Bible, the, 158
'Bioanalysis', 242–3
Biological factors, 59, 78, 84–5, 91, 93, 100–1, 116, 135–6, 205–6, 221, 223, 242–3
Birth
  infantile theories of, 89
  trauma of, 72, 77–8, 83, 126
  symbols for, 22–3
Bisexuality, 100–3, 115–16, 177–8, 188, 189–90
Black Hamlet (by *W. Sachs*), 269 *n.* 1
Blériot, L., 156
B'nai B'rith, Society of, 273–4
Boabdil, King, 261 and *n.* 2
Bolshevism (*see also* Communism; Marxism), 158–9
Bonaparte, Napoleon I, 262, 272 *n.* 1
Bonaparte, Princess Marie (*see also* Bibliography), 268
Bowels, symbols for, 23
Boy's
  castration complex, 110, 114, 180–1
  Oedipus complex, 76–7, 104–5, 114, 180–3
  relation to father, 76–7, 114, 180–7, 262–3
  relation to mother, 59, 76–7, 104–5, 109–10, 114, 117–18, 189
  sexuality compared with girl's, 77, 103–5, 110–11, 112, 114
Brandes, G., 122–3
Braun, H., 275
Braun, L., 275
Breast, child's relation to, 88, 89, 107–8, 177
Breuer, J. (*see also* Bibliography), 66 *n.* 3, 68 *n.* 2, 128 *n.* 1, 231
Brunswick, R. Mack (*see also* Bibliography), 115
Brutus (in *Julius Caesar*), 173
Budapest, 3
Bullitt, W. C. (*see also* Bibliography), 65 *n.* 1, 164–9, 171, 173 *n.* 2, 195 *n.* 1
Burlingham, D. (*see also* Bibliography), 50, 249–50

Buschan, G. (*see also* Bibliography), 201 *n.* 3

Case
of '*Dora*', 199–200
of '*Little Hans*', 76 *n.* 2, 129 *n.* 2
of *Fräulein Rosalia/Rosalie H.*, 106 *n.* 1
of '*Katharina*', 106 *n.* 1
of *Fräulein Anna O.*, 128 *n.* 1
of *Herr P.* and *Dr Forsyth*, 42–8
of *Senatspräsident Schreber*, 88 *n.* 1
of '*Wolf Man*', 76 *n.* 2, 199, 260 *n.* 3
Case, unnamed
of child and gold coin, 50
of childless wife and fortune-teller, 36–8
of people wrecked by success, 258
of physical suffering replacing neurosis, 96
of prophetic graphologist, 40–2
of student and fortune-teller, 38–40
of undistorted dreams (*Popper's* case), 234–5
Castration
anxiety, 167, 181–2, 190
complex, 77, 110–15, 167, 180–1
fear of, 77–9, 110, 114
fright at, 22
symbol for, 205
threat of, 77, 110, 114
Cathexis
drive, and the id, 66–7, 68, 81, 91 and *n.* 2
experimental, by the ego, 79–80
of dream thoughts, 19
of objects, 57, 68, 91 and *n.* 2, 104, 109–10
of repressed wishes, 66, 110
Censor (*see also* Censorship), 14 and *n.* 1
Censorship, 14 and *n.* 1
of dreams, 14–15, 17–19, 25, 233–4
Cervantes, 171
Chamberlain, H. S. (*see also* Bibliography), 278
Character
'anal', 90
disorders of, 136–7, 138
formation of, 57, 80–1, 88, 90, 110–11, 114–15, 116–17, 118, 185, 187, 200
Charcot, J.-M., 83 *n.* 1, 231
Charing Cross Hospital, 43 *n.* 1
Childhood impressions
analysis of, 126, 129–30
as source of dreams, 26–7, 94, 201
pathogenic, 130, 132, 268
repression of, 26, 130, 201, 261–2
Children (*see also* Boy's; Girl's; Infantile)
amoral nature of, 55
and parents, 49–50, 55–8, 59–60, 96–7, 131–2, 136, 143–4, 179–83, 262–3
education of, 4, 59–60, 129–33
helplessness of, 143–4, 147
neuroses of, 73–4, 129–31, 148
play in, 104, 113
psychoanalysis of, 50, 129–31, 136
Christian Science, 170
Christianity, 167–8, 159, 188, 219
Church, the (*see also* Religion), 158, 213, 222
Circumcision and castration, 77
Civilization
drive restrictions and, 97–8, 130, 131, 144, 157, 158–9, 203–5, 222–5
history of, 128
hollowness of modern, 235
process of, 157 and *n.* 3, 210, 224–5
use of term, 157 *n.* 2, 224
war and, 211, 216–17, 224–5
women's contribution to, 116–17
Clitoris, 58, 87, 104, 111–13, 114, 177
Cloaca theory, 89
Communism (*see also* Marxism), 4, 155–9, 219, 221–2
Complemental series, 111
Complete Neuroscientific Works of Sigmund Freud, 200 *n.* 1
Compromises
dreams as, 14, 18, 234–5
neuroses as, 14–15, 234
Compulsion to repeat, 94–5, 117, 126
Condensation
characteristic of the id, 66–7
in dreams, 14, 19

Conscience (*see also* Superego, the), 53–5, 57–8, 59, 96, 144, 183, 221, 258
'Conscience anxiety', 55 *n.* 1
Conscious thinking and unconscious processes, 16–17, 61–4, 233–5
Conscious, the, 14–15
Conservative nature of drives, 94–5, 242
Constitutional factors, 102–3, 114–15, 116, 132, 135–6, 224–5
Contradiction unknown to the id, 65–6
Copernicus, 152
Corfu, 256
Cortical layer, the ego compared to, 67
Cosmogonies, 142–3, 146–7
Crime, 97, 132–3
  acquisition of fire as, 201–3
Culture (*see also* Civilization)
  psychoanalytic therapy as, 71
  use of term, 157 *n.* 2, 224
  heroes, 202–3, 205
Curie, P., 152
Cyrus, 279

Damming up of libido, 190
Danger
  anxiety and, 72–3, 75–9, 82–4
  internal (drive) and external (real), 75, 76–9, 82–3, 260–1
Darwin, C., 152
Day's residues, 10–11, 18, 20, 33
Death
  neurotic's attitude to, 108
  'primitive' view of, 108
  symbol for, 22
Death drive, 4, 94–5, 179–80, 221
Defence, mechanisms of, 260–1
Deferred action (see *Nachträglichkeit*)
Deities (*see* Gods)
Déjà raconté, 260
Déjà vu, 260
Delinquency, 60, 97, 132–3
Delusions, 15, 53
  of persecution, 191
Demons, 145–6
  fear of, 145–6
Depersonalization, 260–1
Depression, 54 *n.* 1
Depth psychology, 7, 62, 111, 120, 128, 139, 172
'Der Sohn des Königs von Ägypten' (by *J. Popper*), 278
Derealization, 259–62
Destructive
  drive, 91 *n.* 2, 92–8, 125, 210, 213, 219–22
  trends, 87–8, 91, 98, 102
Deutsch, H. (*see also* Bibliography), 48, 115
Devereux, G. (*see also* Bibliography), 3
Dialectical materialism (*see* Marxism)
Dionysus, 23
Disavowal, 170, 183, 260–1
Displacement
  characteristic of the id, 66–7
  in dreams, 13, 19, 23
  in jokes, 19
  in memory, 259, 261–2
Disposition to illness, 130
Dispositional points, 88 and *n.* 1
Distortion
  in dreams, 14, 17, 19, 21, 26, 34, 201, 205, 232–6
  in myths, 201–5
  of memory, 256–62
Divination, 140
Don Quixote (by *Cervantes*), 171
'*Dora*', case of (*see* Case of '*Dora*')
Double conscience, 260 and *n.* 4
Doryon, Y. (*see also* Bibliography), 236 *n.* 1, 277–9

Sigmund and Anna Freud en route *to exile, 1938*

In a letter to Max Eitingon dated June 6, 1938, Freud wrote: 'Over the Rhine bridge and we were free! The reception in Paris at the Gare de l'Est was friendly, somewhat noisy with journalists and photographers [. . .] We crossed the Channel by the ferry boat and caught sight of the sea for the first time at Dover. And soon we were in Victoria Station where the immigration officers gave us priority. Our reception in London was a very cordial one. The more serious papers have been printing brief and friendly lines of welcome.'

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

Moses and Monotheism: Three Essays

Moses the Man and Monotheistic Religion
2004 *PMC*, *Mass Psychology and Other Writings*, 165–299. (Tr. J. A. Underwood.)

The present translation is a revised and corrected reprint of the *SE* version.

The first two of the three essays that make up this work appeared originally in 1937 in *Imago*, **23** (1), 5–13, and (4), 387–419; English translations of these two appeared in *Int. J. Psycho-Anal.*, **19** (3) (1938), 291–8, and **20** (1) (1939), 1–32. Section C of Part II of the third essay was read on the author's behalf by Anna Freud at the Paris International Psychoanalytical Congress on August 2, 1938, and was afterwards published separately in *Int. Z. Psychoan. Imago*, **24** (1/2) (1939), 6–9, under the title 'Der Fortschritt in der Geistigkeit' ('The Advance in Intellectuality'). The first essay and the first three sections of the second essay were included in *Almanach 1938*, 9–43. Only a very few unimportant changes were made in these earlier publications when they were included in the complete work. These changes are noted in the present edition.

It was during the summer of 1934 that Freud completed his first version of this book, with the title: *The Man Moses, a Historical Novel* (*Der Mann Moses. Ein historischer Roman*) (Grubrich-Simitis, 1993, 247; trans., 194). In a long letter to Arnold Zweig of September 30, 1934 (included in Freud, 1960*a*, Letter 276), he gave an account of

[4] the book, as well as of his reasons for not publishing it. These were much the same as those which he explains in the first of his prefatory notes to the third essay below (p. 50) – namely, on the one hand, doubts as to whether his argument was sufficiently well established and, on the other hand, fears of the reactions to its publication by the Roman Catholic hierarchy who were at that time dominant in the Austrian government. From the account which he then gave of the work itself, it sounds essentially the same as what we now have – even its form, in three separate sections. However, extensive changes and additions were in fact made in it according to Ilse Grubrich-Simitis (1993, 244–58; trans., 191–203), who identified the manuscript of the first version and two further bundles of related manuscripts (including the manuscript of the second and third essays of the published book and the manuscript of a draft of parts of the third essay). She subjected these manuscripts to comprehensive study (Grubrich-Simitis, 1994, 81–104; trans., 90–106) and showed that 'hardly one stone remained in place' (1993, 326; trans., 257) in Freud's reworking of the book. He was constantly expressing his dissatisfaction with it in his correspondences. There appears to have been a general rewriting of the 'historical novel' in 1934 (even before Freud described it to Zweig) and a further substantial rewriting and expansion of it during the summer of 1936, followed by a final reworking after Freud's exile to London. At all events, the first essay was published at the beginning of 1937 and the second at its end.[1] But the third essay was still held back and only finally passed for printing after Freud's arrival in England in the spring of 1938. The book as a whole (with minor revision of the published essays) was printed that autumn in Holland and the English translation was published in the following March.

What is perhaps likely to strike a reader first about *Moses and Monotheism* is a certain unorthodoxy, or even eccentricity, in its construction: three essays of greatly differing length, two Prefaces, both situated at the beginning of the third essay, and a third Preface situated halfway through that same essay, constant recapitulations and repetitions. Such irregularities are unknown elsewhere in Freud's writings, and he himself points them out and apologizes for them more than once. Their explanation? Undoubtedly the circumstances of the book's composition: the long period – four years or more – during which it was being constantly revised, and the acute external difficulties of the final phase, with a succession of political disorders in Austria culminating in the Nazi occupation of Vienna and Freud's enforced migration to England. That the outcome of these influences was to be seen only in the restricted and temporary field of this single volume is very conclusively
[5] proved by the work which immediately followed this one – the *Outline of Psychoanalysis*, among the most concise and well organized of Freud's writings.

But if *Moses and Monotheism* is judged to lack something in its form of presentation, that is not to imply a criticism of the interest of its content or of the cogency of its arguments. Its historical basis is no doubt a matter for expert dispute, but the ingenuity with which the psychological developments fit in with the premises is likely to persuade the reader who is without prepossession. Those, in particular, who are familiar with the psychoanalysis of the individual will be

1 The latter was finished on August 11, 1937 (Letter to Marie Bonaparte, dated August 13, 1937, in Freud, 1960*a*).

fascinated to see the same succession of developments exhibited in an analysis of a national group. The whole work is, of course, to be regarded as a continuation of Freud's earlier studies of the origins of human social organization in *Totem and Taboo* (1912–13*a*), *RSE*, **13**, and *Group Psychology* (1921*c*), ibid., **18**. A very elaborate and informative discussion of the book can be found in Chapter XIII of the third volume of Ernest Jones's biography (1957, 388–401), and also in Ilse Grubrich-Simitis's (1994) study.

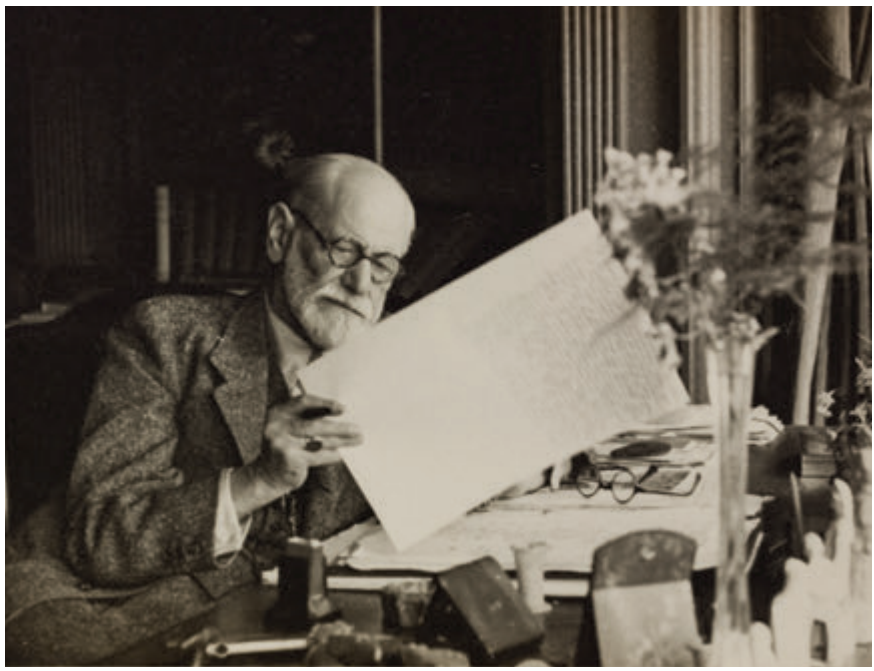
A NOTE ON THE TRANSCRIPTION OF PROPER NAMES

The occurrence in *Moses and Monotheism* of a large number of Egyptian and Hebrew names presents the translator with some special problems. [6]

Egyptian writing does not in general record the vowels, so that the actual pronunciation of Egyptian names can only be guessed by a hazardous process of inferences. Various conventional renderings have therefore been adopted by various authorities. For instance, in discussing this question, Gardiner (1927, Appendix B) quotes four different versions of the name of the owner of a well-known tomb at Thebes: Tehutihetep, Thuthotep, Thothotpou and Dhuthotpe. Just as many variations are to be found of the name of the 'heretic king', who figures so prominently here in Freud's argument. The choice seems to be governed a good deal by nationality. Thus, in the past, English Egyptologists were inclined to Akhnaton, the Germans preferred Echnaton, the American (Breasted) chose Ikhnaton, and the great Frenchman (Maspero) decided on Khouniatonou. Faced with these alluring alternatives, the present translator fell back on the humdrum version which by 1964 had already been adopted for many years by the *Journal of Egyptian Archaeology* and seemed to be the one becoming most generally accepted, at least in English-speaking countries: Akhenaten.[1] This same authority was generally followed in the transcription of all other Egyptian names.

As regards Old Testament names, the answer was simpler, and the forms found in the English Authorized Version were employed. It must be added, however, that the unmentionable name of the Deity is here given the transcription regularly found in the works of English scholars: Yahweh.

1 See, for example, Lindon Smith, *Tombs, Temples and Ancient Art*, University of Oklahoma Press, 1956, and *The Times*, April 2, 1963, p. 14, column 5. Different versions of the name will necessarily be found where Freud quotes from other writers.



Freud reading his manuscript of *Moses and Monotheism* in London, 1938

Freud reading his manuscript of Moses and Monotheism *in London, 1938*

In a letter to Alexander Freud dated June 22, 1938, Freud wrote: 'There were letters from friends, a surprising number from complete strangers who simply wanted to express their delight at our having escaped to safety and who expect nothing in return. In addition of course hordes of autograph hunters, cranks, lunatics and pious men who send tracts and texts from the Gospels which promise salvation, attempts to convert the unbeliever and shed light on the future of Israel. Not to mention the learned societies of which I am already a member, and the endless number of Jewish associations wanting to make me an honorary member. In short, for the first time and late in life I have experienced what it is to be famous.'

I
MOSES AN EGYPTIAN

To deprive a people of the man whom they take pride in as the greatest of their sons is not a thing to be gladly or carelessly undertaken, least of all by someone who is himself one of them. But we cannot allow any such reflection to induce us to put the truth aside in favour of what are supposed to be national interests; and, moreover, the clarification of a set of facts may be expected to bring us a gain in knowledge. [7]

The man Moses,[1] who set the Jewish people free, who gave them their laws and founded their religion, dates from such remote times that we cannot evade a preliminary enquiry as to whether he was a historical personage or a creature of legend. If he lived, it was in the thirteenth, though it may have been in the fourteenth, century before Christ. We have no information about him except from the sacred books of the Jews and their traditions as recorded in writing. Although a decision on the question thus lacks final certainty, an overwhelming majority of historians have nevertheless pronounced in favour of the view that Moses was a real person and that the Exodus from Egypt associated with him did in fact take place. It is justly argued that the later history of the people of Israel would be incomprehensible if this premise were not accepted. Indeed, science today has become altogether more circumspect and handles traditions far more indulgently than in the early days of historical criticism.

The first thing that attracts our attention about the figure [*Person*][T] of Moses is his name, which is 'Mosheh' in Hebrew. 'What is its origin?' we may ask, 'and what does it mean?' As we know, the account in the second chapter of *Exodus* already provides an answer. We are told there that the Egyptian princess who rescued the infant boy from exposure in the Nile gave him that name, putting forward an etymological reason:

1 [Moses is so spoken of in the Bible (cf. *Numbers*, xii, 3), and the phrase occurs repeatedly in this work. It may be recalled that the title of the German original is, literally, *The Man Moses and Monotheist Religion*.]

[8] 'because I drew him out of the water'.[1] This explanation, however, is clearly inadequate. 'The biblical interpretation of the name as "he who was drawn out of the water"', argues a writer in the *Jüdisches Lexikon*,[2] 'is popular etymology, with which, to begin with, it is impossible to harmonize the *active* form of the Hebrew word – for "*Mosheh*" can at most only mean "he who draws out".' We can support this rejection by two further arguments: in the first place, it is absurd to attribute to an Egyptian princess a derivation of the name from the Hebrew, and secondly, the water out of which the child was drawn was most probably not the water of the Nile.

On the other hand, a suspicion has long been expressed, and in many different quarters, that the name 'Moses' is derived from the Egyptian vocabulary. Instead of enumerating all the authorities who have argued in this sense, I will quote the relevant passage from a comparatively recent book, *The Dawn of Conscience* (1934), by J. H. Breasted, a writer whose *History of Egypt* (1906) is regarded as a standard work: 'It is important to notice that his name, Moses, was Egyptian. It is simply the Egyptian word "mose" meaning "child", and is an abridgement of a fuller form of such names as "Amen-mose" meaning "Amon-a-child" or "Ptah-mose" meaning "Ptah-a-child", these forms themselves being likewise abbreviations for the complete form "Amon-(has-given)-a-child" or "Ptah-(has-given)-a-child". The abbreviation "child" early became a convenient rapid form for the cumbrous full name, and the name Mose, "child", is not uncommon on the Egyptian monuments. The father of Moses without doubt prefixed to his son's name that of an Egyptian god like Amon or Ptah, and this divine name was gradually lost in current usage, till the boy was called "Mose". (The final *s* is an addition drawn from the Greek translation of the Old Testament. It is not in the Hebrew which has "Mosheh").'[3] I have repeated this passage word for word and I am by no means ready to share responsibility for its details. I am also rather surprised that Breasted has failed to mention
[9] precisely the analogous theophorous names which figure in the list of Egyptian kings, such as Ahmose, Thoth-mose and Ra-mose.

Now we should have expected that one of the many people who have recognized that 'Moses' is an Egyptian name would also have drawn the conclusion or would at least have considered the possibility that the

1 [*Exodus*, ii, 10. – In this translation, all quotations from the Scriptures are given in the Authorized Version.]

2 Herlitz & Kirschner (1930), **4** [(1), 303. The contributor quoted was M. Soloweitschik.]

3 Breasted, 1934, 350.

person who bore this Egyptian name may himself have been an Egyptian. In relation to modern times we have no hesitation in drawing such conclusions, though nowadays people bear not one name but two – a family name and a personal name – and though a change of name or the adoption of a similar one in fresh circumstances is not beyond possibility. Thus we are not in the least surprised to find it confirmed that the poet Chamisso[1] was French by birth, that Napoleon Buonaparte, on the other hand, was of Italian extraction and that Benjamin Disraeli was indeed an Italian Jew, as we should expect from his name. In relation to ancient and primitive times, one would have thought that a conclusion such as this as to a person's nationality based on his name would have seemed far more reliable and in fact unimpeachable. Nevertheless, so far as I know, no historian has drawn this conclusion in the case of Moses – not even any of those who, once again like Breasted himself (1934, 354), are ready to assume that 'Moses was learned in all the wisdom of the Egyptians'.[2]

What prevented their doing so cannot be judged with certainty. Possibly their reverence for biblical tradition was invincible. Possibly the notion that the man Moses might have been anything but a Hebrew seemed too monstrous. However that may be, it emerges that the recognition that the name of Moses is Egyptian has not been looked upon as affording decisive evidence of his origin, and that no further conclusions have been drawn from it. If the question of this great man's [10]
nationality is regarded as important, it would seem to be desirable to bring forward fresh material that would help towards answering it.

That is what my short paper aims at doing. Its claim to be given a place in the pages of *Imago*[3] rests on the fact that the substance of what it has to contribute is an application of psychoanalysis. The argument arrived at in this way will undoubtedly impress only that minority of readers who are familiar with analytic thinking and who are able to appreciate its findings. To them, however, it will, I hope, appear significant.

1 [Adelbert von Chamisso (1781–1838), author of *Frauenliebe und –leben*, a cycle of lyrics set to music by Schumann, and *Peter Schlemihl*, the story of the man who sold his shadow.]

2 Although the suspicion that Moses was an Egyptian has been voiced often enough without reference to his name, from the earliest times up to the present. [Freud had quoted a comic anecdote to that effect in his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 140. – This footnote appeared first in the 1939 edition. It is not included in the original *Imago* version of 1937 or in the English translation of 1939. – The phrase quoted from Breasted is, in fact, derived from a speech by St Stephen (*Acts*, vii, 22).]

3 [See Editors' Note, p. 3 above.]

In 1909 Otto Rank, who was at that time still under my influence, published, following a suggestion of mine, a book bearing the title *Der Mythus von der Geburt des Helden*.[1] It deals with the fact that 'almost all the prominent civilized nations . . . began at an early stage to glorify their heroes, legendary kings and princes, founders of religions, dynasties, empires or cities, in brief their national heroes, in a number of poetic tales and legends. The history of the birth and of the early life of these personalities came to be especially invested with phantastic
Phantasie [*phantastischen*][T] features, which, in different peoples, even though widely separated by space and entirely independent of each other, present a baffling similarity and in part, indeed, a literal conformity. Many investigators have been impressed with this fact, which has long been recognized.' [p. 1.] If, following Rank, we construct (by a technique a little like Galton's[2]) an 'average legend' that brings into prominence the essential features of all these stories, we arrive at the following picture:

'The hero is the child of the *most aristocratic* parents; usually the son of a king.

'His conception is preceded by difficulties, such as abstinence or pro-
[11] longed barrenness or his parents having to have intercourse in secret owing to external prohibitions or obstacles. During the pregnancy, or even earlier, there is a prophecy (in the form of a dream or oracle) cautioning against his birth, usually threatening danger to his father.

'As a result of this the newborn child is condemned to death or to *exposure*, usually by the orders of *his father or of someone representing him*; as a rule he is given over to the *water* in a *casket*.

'He is afterwards *rescued* by animals or by *humble people* (such as *shepherds*) and is suckled by a *female animal* or by a *humble woman*.

'After he has grown up, he rediscovers his aristocratic parents after highly variegated experiences, *takes his revenge on his father*, on the one hand, and is *acknowledged* on the other and achieves greatness and fame.' [p. 61.]

The oldest of the historical figures to whom this myth of birth is attached is Sargon of Agade, the founder of Babylon (*c.* 2800 B.C.). For

1 [*The Myth of the Birth of the Hero*.] It is far from being my intention to belittle the value of Rank's independent contributions to the work. [The quotations which follow are based on the translation by Robbins & Jelliffe, first published in 1914, to which the page references in the text also relate. Some changes have been made in the interests of greater accuracy.]

2 [Freud has in mind Galton's 'composite photographs' to which he was fond of referring. See, for instance, *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 123.]

us in particular it will not be without interest to quote the account of it, which is attributed to him himself:

'Sargon, the mighty King, the King of Agade am I. *My mother was a Vestal, my father I knew not*, while my father's brother dwelt in the mountains. In my city, Azupirani, which lies on the bank of the Euphrates, my mother, the Vestal, conceived me. *Secretly she bore me. She laid me in a coffer made of reeds*, closed my doorway with pitch, and *let me down into the river*, which did not drown me. The river carried me to Akki, the drawer of water. Akki, the drawer of water, lifted me out in the kindness of his heart. *Akki, the drawer of water, brought me up as his own son*. Akki, the drawer of water, made me his gardener. While I worked as a gardener, [the goddess] Ishtar grew fond of me, I became King and for forty-five years I held kingly sway.' [pp. 12–13.]

The names most familiar to us in the series which begins with Sargon of Agade are Moses, Cyrus and Romulus. But in addition to these Rank has brought together a whole number of other heroic figures from poetry or legend, of whom the same story of their youth is told, either in its entirety or in easily recognizable fragments – including Oedipus, Karna, Paris, Telephos, Perseus, Heracles, Gilgamesh, Amphion and Zethos, and others.[1]

Rank's researches have made us acquainted with the source and pur- [12]
pose of this myth. I need only refer to them with some brief indications. A hero is someone who has had the courage to rebel against his father and has in the end victoriously overcome him. Our myth traces this struggle back as far as the individual's prehistory, for it represents him as being born against his father's will and rescued despite his father's evil intention. The exposure in a casket is an unmistakable symbolic representation of birth: the casket is the womb and the water is the amniotic fluid. The parent–child relationship is represented in countless dreams by pulling out of the water or rescuing from the water.[2] When a people's imagination attaches the myth of birth which we are discussing to an outstanding figure, it is intending in that way to recognize him as a hero and to announce that he has fulfilled the regular pattern of a hero's life. In fact, however, the source of the whole poetic fiction is what is known as a child's 'family romance', in which the son reacts to a change in his emotional relation to his parents and in particular to his

1 [Karna was a hero in the Sanskrit epic *Mahabharata*, Gilgamesh was a Babylonian hero and the remainder were figures in Greek mythology.]

2 [See, for instance, *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 357–9.]

father.[1] A child's earliest years are dominated by an enormous overvaluation of his father; in accordance with this a king and queen in dreams and fairy tales invariably stand for parents. Later, under the influence of rivalry and of disappointment in real life, the child begins to detach himself from his parents and to adopt a critical attitude towards his father. Thus the two families in the myth – the aristocratic one and the humble one – are both of them reflections of the child's own family as they appeared to him in successive periods of his life.

We may fairly say that these explanations make the widespread and uniform nature of myths of the birth of heroes fully intelligible. For that reason it is all the more deserving of interest that the legend of the birth and exposure of Moses occupies a special position and, indeed, in one essential respect contradicts the rest.

Let us start from the two families between which, according to the
[13] legend, the child's destiny is played out. According to the analytic interpretation [*Deutung*][T], as we know, the families are one and the same and are only differentiated chronologically. In the typical form of the legend, it is the first family, the one into which the child is born, which is the aristocratic one, most often of royal rank; the second family, the one in which the child grows up, is the one that is humble or has fallen on evil days. This tallies, moreover, with the circumstances [of the 'family romance'] to which the interpretation traces the legend back. Only in the legend of Oedipus is this difference blurred: the child which has been exposed by one royal family is received by another royal couple. It can scarcely be by chance, one feels, that precisely in this example the original identity of the two families may be dimly perceived in the legend itself. The social contrast between the two families provides the myth – which, as we know, is designed to stress the heroic nature of a great man – with a second function which becomes of special significance when applied to historical personages. For the myth can also be employed to create a patent of nobility for the hero, to raise his social standing. To the Medes, Cyrus was a foreign conqueror; but by means of a legend of exposure he became the grandson of their king. The same applies to Romulus. If any such person existed, he must have been an adventurer of unknown origin, an upstart; the legend, however, made him offspring of and heir to the royal house of Alba Longa.

With Moses things were quite different. In his case the first family,

1 [Cf. Freud's paper 'Family Romances' (1909*c*), *RSE*, **9**, 211 ff. That paper was first published as a part of the volume by Rank which has been quoted above.]

elsewhere the aristocratic one, was sufficiently modest. He was the child of Jewish Levites. But the place of the second family, elsewhere the humble one, was taken by the royal house of Egypt; the princess brought him up as her own son. This deviation from type has puzzled many people. Eduard Meyer,[1] and others following him, assumed that originally the legend was different. Pharaoh, according to them, had been warned by a prophetic dream[2] that a son born to his daughter would bring danger to him and his kingdom. He therefore had the child exposed in the Nile after his birth. But he was rescued by Jewish people and brought up as their child. For 'nationalist motives' (as Rank puts it[3]) the legend would then have been given the modified form in which we know it.

A moment's reflection, however, tells us that an original legend of [14]
Moses like this, one no longer deviating from the other legends, cannot have existed. For it was either of Egyptian or of Jewish origin. The first alternative is ruled out: the Egyptians had no motive for glorifying Moses, since he was no hero to them. We are to suppose, then, that the legend was created among the Jewish people – that is to say, that it was attached in its familiar form [i.e. in the typical form of a birth-legend] to the figure of their leader. But it was totally unsuitable for that purpose, for what would be the use to a people of a legend which made their great man into a foreigner?

The legend of Moses, in the form in which we have it today, falls notably short of its secret intention. If Moses was not of royal birth, the legend could not stamp him as a hero; if it left him as a Jewish child, it had done nothing to raise his social standing. Only one small fragment of the entire myth remains effective: the assurance that the child had survived in the face of powerful external forces. (This feature recurs in the story of the childhood of Jesus, in which King Herod takes over the role of Pharaoh.) Thus we are in fact free to suppose that some later and clumsy adapter of the material of the legend found an opportunity for introducing into the story of his hero Moses something which resembled the classical exposure legends marking out a hero, but which, on account of the special circumstances of the case, was not applicable to Moses.

1 [Meyer, 1906, 46 f.]

2 This is also mentioned in the account given by Flavius Josephus.

3 Rank, 1909, 80 *n*.

Our investigations might have had to rest content with this inconclusive and, moreover, uncertain outcome, and they might have done nothing towards answering the question of whether Moses was an Egyptian. There is, however, another and perhaps more hopeful line of approach to an assessment of the legend of exposure.

Let us return to the two families of the myth. At the level of analytic interpretation they are, as we know, identical; whereas at the level of the myth they are differentiated into an aristocratic family and a humble one. Where, however, the figure to whom the myth is attached is a historical one, there is a third level – that of reality. One of the families is the real one, in which the person in question (the great man) was actually born and grew up; the other is fictitious, fabricated by the myth
[15] in pursuit of its own intentions. As a rule the humble family is the real one and the aristocratic family the fabricated one. The situation in the case of Moses seemed somehow different. And here the new line of approach will perhaps lead to a clarification: in every instance which it has been possible to test, the first family, the one from which the child was exposed, was the invented one, and the second one, in which he was received and grew up, was the real one. If we have the courage to recognize this assertion as universally true and as applying also to the legend of Moses, then all at once we see things clearly: Moses was an Egyptian – probably an aristocrat – whom the legend was designed to turn into a Jew. And that would be our conclusion. The exposure in the water was at its correct point in the story; but, in order to fit in with the fresh purpose, its aim had to be somewhat violently twisted. From being a way of sacrificing the child, it was turned into a means of rescuing him.

The deviation of the legend of Moses from all the others of its kind can be traced back to a special feature of his history. Whereas normally a hero, in the course of his life, rises above his humble beginnings, the heroic life of the man Moses began with his stepping down from his exalted position and descending to the level of the Children of Israel.

We started on this brief enquiry in the expectation of deriving a fresh argument from it in support of the suspicion that Moses was an Egyptian. We have seen that the first argument, based on his name, failed with many people to carry conviction.[1] We must be prepared to find that this

1 Thus Eduard Meyer writes (1905, 651): 'The name "Moses" is probably Egyptian, and the name "Pinchas" in the priestly family of Shiloh . . . is undoubtedly Egyptian. Of course this does not prove that these families were of Egyptian origin, but, no doubt, that they had connections with Egypt.' We may ask, to be sure, what sort of connections this is supposed to make us

new argument, based on an analysis of the legend of exposure, may have no better success. It will no doubt be objected that the circumstances of the construction [*Bildung*][T] and transformation of legends are, after all, [16] too obscure to justify a conclusion such as ours and that the traditions surrounding the heroic figure of Moses – with all their confusion and contradictions and their unmistakable signs of centuries of continuous and tendentious revisions and superimpositions – are bound to baffle every effort to bring to light the kernel of historical truth that lies behind them. I do not myself share this dissenting attitude but neither am I in a position to refute it.

If no more certainty could be reached than this, why, it may be asked, have I brought this enquiry into public notice at all? I am sorry to say that even my justification for doing so cannot go beyond hints. For if one allows oneself to be carried away by the two arguments which I have put forward here, and if one sets out to take the hypothesis seriously that Moses was an aristocratic Egyptian, very interesting and far-reaching prospects are opened up. With the help of some not very remote assumptions, we shall, I believe, be able to understand the motives which led Moses in the unusual step he took and, closely related to this, to obtain a grasp of the possible basis of a number of the characteristics and peculiarities of the laws and religion which he gave to the Jewish people; and we shall even be led on to important considerations regarding the origin of monotheist religions in general. Such weighty conclusions cannot, however, be founded on psychological probabilities alone. Even if one accepts the fact of Moses being an Egyptian as a first historical foothold, one would need to have at least a second firm fact in order to defend the wealth of emerging possibilities against the criticism of their being a product of the imagination [*Phantasie*] and too remote from reality. Objective evidence of the period to which the life of Moses and with it the Exodus from Egypt are to be referred would perhaps have fulfilled this requirement. But this has not been obtainable, and it will therefore be better to leave unmentioned any further implications of the discovery that Moses was an Egyptian.

think of. [This paper by Meyer (1905) is a résumé of a very much longer one (1906) where the question of these Egyptian names is further examined (450–1). From this it appears that there were two men called 'Pinchas' ('Phinehas' in the Authorized Version) – one a grandson of Aaron (*Exodus*, vi, 25, and *Numbers*, xxv, 7) and the other a priest at Shiloh (I *Samuel*, i, 3), both of them Levites. (Cf. p. 37 below.) Shiloh was the place where the Ark was stationed before its ultimate removal to Jerusalem. (Cf. *Joshua*, xviii, 1.)]

II

IF MOSES WAS AN EGYPTIAN . . .

[17] In an earlier contribution to this periodical,[1] I attempted to bring up a fresh argument in support of the hypothesis that the man Moses, the liberator and lawgiver of the Jewish people, was not a Jew but an Egyptian. It had long been observed that his name was derived from the Egyptian vocabulary, though the fact had not been properly appreciated. What I added was that the interpretation of the myth of exposure which was linked with Moses necessarily led to the inference that he was an Egyptian whom the needs of a people sought to make into a Jew. I remarked at the end of my paper that important and far-reaching implications followed from the hypothesis that Moses was an Egyptian, but that I was not prepared to argue publicly in favour of these implications, since they were based only on psychological probabilities and lacked any objective proof. The greater the importance of the views arrived at in this way, the more strongly one feels the need to beware of exposing them without a secure basis to the critical assaults of the world around one – like a bronze statue with feet of clay. Not even the most tempting probability is a protection against error; even if all the parts of a problem seem to fit together like the pieces of a jigsaw puzzle, one must reflect that what is probable is not necessarily the truth and that the truth is not always probable. And lastly, it did not seem attractive to find oneself classed with the schoolmen and Talmudists who delight in exhibiting their ingenuity without regard to how remote from reality their thesis may be.

Notwithstanding these hesitations, which weigh as much with me today as they did before, the outcome of my conflicting motives is a decision to produce the present sequel to my earlier communication. But once again this is not the whole story nor the most important part of the whole story.

1 *Imago*, **23** (1937). [Essay I above.]

(1)

If, then, Moses was an Egyptian – our first yield from this hypothesis is [18]
a fresh enigma and one which it is hard to solve. If a people or a tribe[1]
sets out upon a great undertaking, it is only to be expected that one of
its members will take his place as their leader or will be chosen for that
post. But it is not easy to guess what could induce an aristocratic Egyp-
tian – a prince, perhaps, or a priest or high official – to put himself at
the head of a crowd of immigrant foreigners at a backward level of civ-
ilization and to leave his country with them. The well-known contempt
felt by the Egyptians for foreign nationals makes such a proceeding
particularly unlikely. Indeed I could well believe that this has been pre-
cisely why even those historians who have recognized that the man's
name was Egyptian, and who have ascribed to him all the wisdom of the
Egyptians [p. 11 above], have been unwilling to accept the obvious
possibility that Moses was an Egyptian.

This first difficulty is promptly followed by another. We must not
forget that Moses was not only the political leader of the Jews settled
in Egypt but was also their lawgiver and educator and forced them into
the service of a new religion, which to this very day is known after him
as the Mosaic one. But is it so easy for one single man to create a new
religion? And if anyone wishes to influence another person's religion,
would he not most naturally convert him to his own? The Jewish
people in Egypt were certainly not without a religion of some form or
other; and if Moses, who gave them a new one, was an Egyptian, the
presumption cannot be put aside that this other new religion was the
Egyptian one.

There is something that stands in the way of this possibility: the fact
of there being the most violent contrast between the Jewish religion
which is attributed to Moses and the religion of Egypt. The former is a
rigid monotheism on the grand scale: there is only one God, he is the
sole God, omnipotent, unapproachable; his aspect is more than human
eyes can tolerate, no image must be made of him, even his name may
not be spoken. In the Egyptian religion there is an almost innumerable
host of deities of varying dignity and origin: a few personifications of [19]
great natural forces such as heaven and earth, sun and moon, an occa-
sional abstraction such as Ma'at (truth or justice) or a caricature such
as the dwarflike Bes; but most of them local gods, dating from the
period when the country was divided into numerous provinces, with the

1 We have no notion of what numbers were concerned in the Exodus from Egypt.

shape of animals, as though they had not yet completed their evolution from the old totem animals, with no sharp distinctions between them, and scarcely differing in the functions allotted to them. The hymns in honour of these gods say almost the same things about all of them, and identify them with one another unhesitatingly, in a manner hopelessly confusing to us. The names of gods are combined with one another, so that one of them may almost be reduced to being an epithet of the other. Thus, in the heyday of the 'New Kingdom' the principal god of the city of Thebes was called Amen-Re'; the first part of this compound stands for the ram-headed god of the city, while Re' is the name of the falcon-headed sun god of On [Heliopolis]. Magical and ceremonial acts, charms and amulets dominated the service of these gods as they did the daily life of the Egyptians.

Some of these differences may easily be derived from the fundamental contrast between a strict monotheism and an unrestricted polytheism. Others are evidently the result of a difference in spiritual and intellectual[1] level, since one of these religions is very close to primitive phases [of development], while the other has risen to the heights of sublime abstraction. It may be due to these two factors that one occasionally has an impression that the contrast between the Mosaic and the Egyptian religions is a deliberate one and has been intentionally heightened – when, for instance, one of them condemns magic and sorcery in the severest terms, while in the other they proliferate with the greatest luxuriance, or when the insatiable appetite of the Egyptians for embodying their gods in clay, stone and metal (to which our museums owe so much today) is confronted with the harsh prohibition against making an image of any living or imagined creature.

But there is still another contrast between the two religions which is not met by the explanations we have attempted. No other people of
[20] antiquity did so much [as the Egyptians] to deny death or took such pains to make existence in the next world possible. And accordingly Osiris, the god of the dead, the ruler of this other world, was the most popular and undisputed of all the gods of Egypt. On the other hand the ancient Jewish religion renounced immortality entirely; the possibility of existence continuing after death is nowhere and never mentioned. And this is all the more remarkable since later experiences have shown

1 ['*geistigen*' is the word here translated 'spiritual and intellectual'. This concept becomes of great importance towards the end of this work, especially in Section C of Part II of Essay III. Cf. the footnote on p. 79 below. See *RSE*, **24**, 82–4.]

that belief in an afterlife is perfectly well compatible with a monotheist religion.

It was our hope that the hypothesis that Moses was an Egyptian would turn out to be fruitful and illuminating in various directions. But the first conclusion we drew from that hypothesis – that the new religion which he gave to the Jews was his own Egyptian one – has been invalidated by our realization of the different, and indeed contradictory, character of the two religions.

(2)

Another possibility is opened to us by a remarkable event in the history of the Egyptian religion, an event which has only lately been recognized and appreciated. It remains possible that the religion which Moses gave to his Jewish people was nevertheless his own – that it was *an* Egyptian religion, though not *the* Egyptian religion.

In the glorious Eighteenth Dynasty, under which Egypt first became a world power, a young Pharaoh came to the throne in about the year 1375 B.C. To begin with he was called, like his father, Amenophis (IV), but later he changed his name and not only his name. This king set about forcing a new religion on his Egyptian subjects – a religion which ran contrary to their thousands-of-years-old traditions and to all the familiar habits of their lives. It was a strict monotheism, the first attempt of the kind, so far as we know, in the history of the world, and along with the belief in a single god religious intolerance was inevitably born, which had previously been alien to the ancient world and remained so long afterwards. The reign of Amenophis, however, lasted for only seventeen years. Very soon after his death in 1358 B.C., the new religion was swept away and the memory of the heretic king was proscribed. What little we know of him is derived from the ruins of the new royal capital which [21] he built and dedicated to his god and from the inscriptions in the rock tombs adjacent to it. Whatever we can learn about this remarkable and, indeed, unique personality is deserving of the highest interest.[1]

Every novelty must have its preliminaries and preconditions in something earlier. The origins of Egyptian monotheism can be traced back a little way with some certainty.[2] For a considerable time, tendencies had been at work among the priesthood of the sun temple at On (Heliopolis)

1 Breasted [1906, 356] calls him 'the first individual in human history'.

2 What follows is in the main based on the accounts given by Breasted (1906 and 1934) and in the relevant sections of the *Cambridge Ancient History*, Vol. II [1924].

in the direction of developing the idea [*Vorstellung*][T] of a universal god and of emphasizing the ethical side of his nature. Ma'at, the goddess of truth, order and justice, was a daughter of the sun god Re'. During the reign of Amenophis III, the father and predecessor of the reformer, the worship of the sun god had already gained a new impetus – probably in opposition to Amun of Thebes, who had become too powerful. A very ancient name of the sun god, Aten or Atum, was brought into fresh prominence, and the young king found in this Aten religion a movement ready to hand, which he did not have to be the first to inspire but of which he could become an adherent.

The political conditions in Egypt had begun at this time to exercise a lasting influence on the Egyptian religion. As a result of the military exploits of the great conqueror, Tuthmosis III, Egypt had become a world power: the empire now included Nubia in the south, Palestine, Syria and a part of Mesopotamia in the north. This imperialism was reflected in religion as universalism and monotheism. Since the Pharaoh's responsibilities now embraced not only Egypt but Nubia and Syria as well, deity too was obliged to abandon its national limitation and, just as the Pharaoh was the sole and unrestricted ruler of the world known to the Egyptians, this must also apply to the Egyptians' new deity. Moreover, with the extension of the empire's frontiers, it was natural that Egypt would become more accessible to foreign influences; some of the royal wives were Asiatic princesses,[1] and it is possible that
[22] direct incitements to monotheism even made their way in from Syria.

Amenophis never denied his adherence to the sun cult of On. In the two Hymns to the Aten which have survived in the rock tombs and which were probably composed by him himself, he praises the sun as the creator and preserver of all living things both inside and outside Egypt with an ardour which is not repeated till many centuries later in the Psalms in honour of the Jewish god Yahweh. He was not content, however, with this astonishing anticipation of the scientific discovery of the effect of solar radiation. There is no doubt that he went a step further: that he did not worship the sun as a material object but as the symbol of a divine being whose energy was manifested in its rays.[2]

1 This may perhaps be true even of Nefertiti, the beloved wife of Amenophis.

2 'But, however evident the Heliopolitan origin of the new state religion might be, it was not merely sun-worship; the word Aton was employed in the place of the old word for "god" (*nuter*), and the god is clearly distinguished from the material sun.' Breasted, 1906, 360. – 'It is evident that what the king was deifying was the force by which the Sun made himself felt on earth.' Breasted, 1934, 279. – Erman (1905, 66) makes a similar judgement on a formula in honour of the god: 'These are . . . words which are meant to express as abstractly as possible that it is not the heavenly body itself that is worshipped but the being which reveals itself in it.'

We should not, however, be doing justice to the king if we regarded him merely as an adherent or promoter of an Aten religion already in existence before his time. His activity was a far more energetic intervention. He introduced something new, which for the first time converted the doctrine of a universal god into monotheism – the factor of exclusiveness. In one of his hymns he declares expressly: 'O thou sole God, beside whom there is no other!'[1] And we must not forget that in assessing the new doctrine a knowledge of its *positive* contents is not enough: its *negative* side is almost equally important – a knowledge of what it rejects. It would be a mistake, too, to suppose that the new religion was completed at a single blow and sprang to life fully armed, like Athene out of the head of Zeus. Everything suggests, rather, that in the course of the reign of Amenophis it increased little by little to ever-greater clarity, consistency, harshness and intolerance. It is likely that this development came about under the influence of the violent opposition to the king's reform which arose among the priests of Amun. In [23]
the sixth year of the reign of Amenophis this antagonism had reached such a pitch that the king changed his name, of which the proscribed name of the god Amun formed a part. Instead of 'Amenophis' he now called himself 'Akhenaten'.[2] But it was not only from his own name that he expunged that of the detested god: he erased it too from every inscription – even where it occurred in the name of his father, Amenophis III. Soon after changing his name Akhenaten abandoned the Amun-dominated city of Thebes and built himself a new royal capital lower down the river, which he named Akhetaten (the horizon of the Aten). Its ruined site is now known as Tell el-'Amarna.[3]

The persecution by the king fell most harshly upon Amun, but not on him alone. Throughout the kingdom temples were closed, divine service forbidden, temple property confiscated. Indeed, the king's zeal went so far that he had the ancient monuments examined in order to have the word 'god' obliterated in them where it occurred in the plural.[4] It is not to be wondered at that these measures taken by Akhenaten provoked a

1 Breasted, 1906, 374 *n*.

2 [In the German editions the name is spelt 'Ikhnaton'.] I adopt here the English spelling of the name (alternatively 'Akhenaton'). The king's new name has approximately the same meaning as his earlier one: 'The god is satisfied.' Cf. the German 'Gotthold' ['God is gracious'] and 'Gottfried' ['God is satisfied']. – [This footnote is translated literally from the German editions. In fact, 'Ikhnaton' was Breasted's (American) version of the name. For all this see the 'Note on the Transcription of Proper Names', p. 7 above.]

3 It was there that in 1887 the discovery – of such great historical importance – was made of the Egyptian kings' correspondence with their friends and vassals in Asia.

4 Breasted, 1906, 363.

mood of fanatical vindictiveness among the suppressed priesthood and unsatisfied common people, and this was able to find free expression after the king's death. The Aten religion had not become popular; it had probably remained restricted to a narrow circle surrounding the king's person. Akhenaten's end remains veiled in obscurity. We hear of a few shortlived, shadowy successors from his own family. His son-in-law, Tut'ankhaten, was already compelled to return to Thebes and to replace the name of the god Aten in his name with that of Amun. There fol-
[24] lowed a period of anarchy till in 1350 B.C. a general, Haremhab, succeeded in restoring order. The glorious Eighteenth Dynasty was at an end and simultaneously its conquests in Nubia and Asia were lost. During this gloomy interregnum the ancient religions of Egypt were re-established. The Aten religion was abolished, Akhenaten's royal city was destroyed and plundered and his memory proscribed as that of a criminal.

It is with a particular purpose that we shall now emphasize a few points among the negative characteristics of the Aten religion. In the first place, everything to do with myths, magic and sorcery is excluded from it.[1] In the next place, the manner in which the sun god was represented was no longer, as in the past, by a small pyramid and a falcon,[2] but – and this seems almost prosaic – by a round disk with rays proceeding from it, which end in human hands. In spite of all the exuberant art of the Amarna period, no other representation of the sun god – no personal image of the Aten – has been found, and it may confidently be said that none will be found.[3] Lastly, there was complete silence about the god of the dead, Osiris, and the kingdom of the dead. Neither the hymns nor the tomb inscriptions have any knowledge of what perhaps lay closest to the hearts of the Egyptians. The contrast to the popular religion cannot be more clearly demonstrated.[4]

(3)

I should now like to venture on this conclusion: if Moses was an Egyptian and if he communicated his own religion to the Jews, it must have been Akhenaten's, the Aten religion.

1 Weigall (1922, 120–1) says that Akhenaten would hear nothing of a Hell against whose terrors people might protect themselves with innumerable magical formulae: 'Akhnaton flung all these formulae into the fire. Djins, bogies, spirits, monsters, demigods, demons, and Osiris himself with all his court, were swept into the blaze and reduced to ashes.'

2 [This should perhaps read 'a pyramid or a falcon'. Cf. Breasted, 1934, 278.]

3 'Akhnaton did not permit any graven image to be made of the Aton. The True God, said the king, had no form; and he held to this opinion throughout his life.' (Weigall, 1922, 103.)

4 'Nothing was to be heard any more of Osiris and his kingdom.' (Erman, 1905, 70.) – 'Osiris is completely ignored. He is never mentioned in any record of Ikhnaton or in any of the tombs at Amarna.' (Breasted, 1934, 291.)

I have already compared the Jewish religion with the popular religion [25]
of Egypt and shown the opposition between them. I must now make a comparison between the Jewish and the Aten religions in the expectation of proving their original identity. This, I am aware, will present no easy task. Thanks to the vindictiveness of the priests of Amun we may perhaps know too little of the Aten religion. We only know the Mosaic religion in its final shape, as it was fixed by the Jewish priesthood some eight hundred years later in post-exilic times. If, in spite of this unfavourable state of the material, we find a few indications which favour our hypothesis, we shall be able to set a high value on them.

There would be a short path to proving our thesis that the Mosaic religion was none other than that of the Aten – namely, if we had a confession of faith, a declaration. But I fear we shall be told that this path is closed to us. The Jewish confession of faith, as is well known, runs: 'Schema Jisroel Adonai Elohenu Adonai Echod.'[1] If it is not merely by chance that the name of the Egyptian Aten (or Atum) sounds like the Hebrew word *Adonai* [lord] and the name of the Syrian deity Adonis, but if it is due to a primaeval kinship of speech and meaning, then the Jewish formula might be translated thus: 'Hear, O Israel: our god Aten (Adonai) is a sole god.' Unfortunately I am totally incompetent to answer this question, and I have been able to find but little about it in the literature of the subject.[2] But in all probability this is making things too easy for us. In any case we shall have to come back once more to the problems concerning the name of the god.

The similarities as well as the differences between the two religions are easily discernible without giving us much light. Both of them were forms of a strict monotheism, and we shall be inclined *a priori* to trace back what they had in common to this fundamental characteristic. Jewish monotheism behaved in some respects even more harshly than the Egyptian: for instance in forbidding pictorial representations of any [26]
kind. The most essential difference is to be seen (apart from their gods' names) in the fact that the Jewish religion was entirely without sun worship, in which the Egyptian one still found support. When we were making the comparison with the popular religion of Egypt, we had an impression that, apart from the fundamental contrast, a factor of *intentional* contradiction played a part in the difference between the two religions. This impression seems to be justified if now, in making the

1 ['Hear, O Israel: the Lord our God is one Lord' (*Deuteronomy*, vi, 4).]

2 Only a few passages in Weigall (1922, 12 and 19), to the effect that 'the god Atum, the aspect of Ra as the setting sun, was probably of common origin with Aton who was largely worshipped in North Syria', and that a 'foreign queen with her retinue may have therefore felt more sympathy with Heliopolis than with Thebes'. [The connection between Aten and Atum, suggested by Weigall, is not generally accepted by Egyptologists.]

comparison, we replace the Jewish religion with the Aten religion which, as we know, was developed by Akhenaten in deliberate hostility to the popular one. We were rightly surprised to find that the Jewish religion would have nothing to do with the next world or a life after death, though a doctrine of that kind would have been compatible with the strictest monotheism. But this surprise vanishes if we turn back from the Jewish to the Aten religion and suppose that this refusal was taken over from it, since for Akhenaten it was a necessity in his fight against the popular religion, in which Osiris, the god of the dead, played a greater part, perhaps, than any god in the upper world. The agreement between the Jewish and the Aten religions on this important point is the first strong argument in favour of our thesis. We shall learn that it is not the only one.

Moses did not only give the Jews a new religion; it can be stated with equal certainty that he introduced the custom of circumcision to them. This fact is of decisive importance for our problem and has scarcely ever been considered. It is true that the biblical account contradicts this more than once. On the one hand it traces circumcision back to the patriarchal age as a mark of a covenant between God and Abraham; on the other hand it describes in a quite particularly obscure passage how God was angry with Moses for having neglected a custom which had become holy,[1] and sought to kill him; but that his wife, a Midianite, saved her husband from God's wrath by quickly performing the operation.[2] These, however, are distortions, which should not lead us astray; later on we shall discover the reason for them. The fact remains that there is only one answer to the question of where the Jews derived the
[27] custom of circumcision from – namely, from Egypt. Herodotus, the 'father of history', tells us that the custom of circumcision had long been indigenous in Egypt,[3] and his statements are confirmed by the findings in mummies and indeed by pictures on the walls of tombs. No other people of the Eastern Mediterranean, so far as we know, practised this custom; it may safely be presumed that the Semites, Babylonians and Sumerians were uncircumcised. The Bible story itself says this is so of the inhabitants of Canaan; it is a necessary premise to the adventure of

1 [*'geheiligten.'* Cf. p. 109 below.]

2 [*Genesis*, xvii, 9 ff., and *Exodus*, iv, 24 ff. Cf. the explanation of the episode on p. 42 below.]

3 [Herodotus, *History*, Book II, Chapter 104.]

Jacob's daughter and the Prince of Shechem.[1] The possibility that the Jews acquired the custom of circumcision during their sojourn in Egypt in some way other than in connection with the religious teaching of Moses may be rejected as completely without foundation. Now, taking it as certain that circumcision was a universal popular custom in Egypt, let us for a moment adopt the ordinary hypothesis that Moses was a Jew, who sought to free his compatriots from bondage in Egypt and lead them to develop an independent and self-conscious national existence in another country – which was what in fact happened. What sense could it have, in that case, that he should at the same time impose on them a troublesome custom which even, to some extent, made them into Egyptians and which must keep permanently alive their memory of Egypt – whereas his efforts could only be aimed in the opposite direction, towards alienating his people from the land of their bondage and overcoming their longing for the 'flesh-pots of Egypt'? No, the fact from which we started and the hypothesis which we added to it are so incompatible with each other that we may be bold enough to reach this conclusion: if Moses gave the Jews not only a new religion but also the commandment for circumcision, he was not a Jew but an Egyptian, and [28] in that case the Mosaic religion was probably an Egyptian one and, in view of its contrast to the popular religion, the religion of the Aten, with which the later Jewish religion agrees in some remarkable respects.

I have pointed out that my hypothesis that Moses was not a Jew but an Egyptian created a fresh riddle. His course of conduct, which seemed easily intelligible in a Jew, was un-understandable in an Egyptian. If, however, we place Moses in the time of Akhenaten and suppose him in contact with that Pharaoh, the riddle vanishes and the possibility is revealed of motives which will answer all our questions. Let us start from the assumption that Moses was an aristocratic and prominent man, perhaps in fact a member of the royal house, as the legend says of him. He was undoubtedly aware of his great capacities, ambitious and energetic; he may even have played with the notion of one day being the leader of his people, of becoming the kingdom's ruler. Being close to the Pharaoh, he was a convinced adherent of the new religion, whose

1 [*Genesis*, xxxiv.] I am very well aware that in dealing so autocratically and arbitrarily with biblical tradition – bringing it up to confirm my views when it suits me and unhesitatingly rejecting it when it contradicts me – I am exposing myself to serious methodological criticism and weakening the convincing force of my arguments. But this is the only way in which one can treat material of which one knows definitely that its trustworthiness has been severely impaired by the distorting influence of tendentious purposes. It is to be hoped that I shall find some degree of justification later on, when I come upon the track of these secret motives. Certainty is in any case unattainable and moreover it may be said that every other writer on the subject has adopted the same procedure.

basic thoughts he had made his own. When the king died and the reaction set in, he saw all his hopes and prospects destroyed; if he was not prepared to abjure all the convictions that were so dear to him, Egypt had nothing more to offer him – he had lost his country. In this predicament he found an unusual solution. Akhenaten the dreamer had alienated his people and let his empire fall to pieces. The more energetic nature of Moses was more at home with the plan of founding a new kingdom, of finding a new people to whom he would present for their worship the religion which Egypt had disdained. It was, we can see, a heroic attempt to combat destiny [*Schicksal*][T], to compensate in two directions for the losses in which Akhenaten's catastrophe had involved him. Perhaps he was at that time Governor of the frontier province (Goshen) in which certain Semitic tribes had settled (perhaps as early as in the Hyksos period[I]). These he chose to be his new people – a historic decision.[2] He came to an agreement with them, put himself at their head [29] and carried the Exodus through 'by strength of hand'.[3] In complete contrast to the biblical tradition, we may presume that this Exodus took place peacefully and unpursued. The authority of Moses made this possible and at that time there was no central administration which might have interfered with it.

According to this construction of ours, the Exodus from Egypt would have occurred during the period between 1358 and 1350 B.C. – that is, after Akhenaten's death and before Haremhab's re-establishment of state authority.[4] The goal of the migration could only have been the land of Canaan. After the collapse of the Egyptian domination, hordes of warlike Aramaeans had irrupted into that region, conquering and plundering, and had shown in that way where a capable people might win fresh land for themselves. We learn of these warriors from the letters found in 1887 in the ruined city of Amarna. There they are called

1 [A disordered period some 200 years before the time of Akhenaten, when a Semitic people (the so-called 'Shepherd Kings') ruled Northern Egypt.]

2 If Moses was a high official, this makes it easier to understand the role of leader which he assumed with the Jews; if he was a priest, then it was natural for him to emerge as the founder of a religion. In both these cases he would have been continuing his former profession. A prince of the royal house might easily have been both – a provincial governor and a priest. In the account given by Flavius Josephus (in his *Jewish Antiquities*), who accepts the exposure legend but seems to be in touch with traditions other than the biblical one, Moses, as an Egyptian general, fought a victorious campaign in Ethiopia. [English translation, 1930, 269 ff.]

3 [*Exodus*, xiii, 3, 14 and 16.]

4 This would make the Exodus about a century earlier than is supposed by most historians, who put it in the Nineteenth Dynasty under Merenptah [sometimes transliterated 'Meneptah']. Or it may have happened a little later [than is suggested in the text above], for the official [Egyptian] histories seem to have included the interregnum in the reign of Haremhab. [See below, p. 46.]

'Habiru', and the name was transferred (we do not know how) to the later Jewish invaders – 'Hebrews' – who cannot be intended in the Amarna letters. South of Palestine, too, in Canaan, there lived the tribes which were the nearest relatives of the Jews who were now making their way out of Egypt.

The motives which we have discovered for the Exodus as a whole apply also to the introduction of circumcision. We are familiar with the attitude adopted by people (both nations and individuals) to this primaeval usage, which is scarcely understood any longer. Those who do not practise it look on it as very strange and are a little horrified by it, but those who have adopted circumcision are proud of it. They feel exalted by it, ennobled, as it were, and look down with contempt on [30] the others, whom they regard as unclean. Even to this day a Turk will abuse a Christian as an 'uncircumcised dog'. It may be supposed that Moses, who, being an Egyptian, was himself circumcised, shared this attitude. The Jews with whom he departed from his country were to serve him as a superior substitute for the Egyptians he had left behind. On no account must the Jews be inferior to them. He wished to make them into a 'holy nation', as is expressly stated in the biblical text,[1] and as a mark of this consecration he introduced among them too the custom which made them at least the equals of the Egyptians. And he could only welcome it if they were to be isolated by such a sign and kept apart from the foreign peoples among whom their wanderings would lead them, just as the Egyptians themselves had kept apart from all foreigners.[2]

1 [*Exodus*, xix, 6. The same word is used in this connection elsewhere in the Authorized Version, e.g. *Deuteronomy*, vii, 6. Cf. p. 109 below.]

2 Herodotus, who visited Egypt about 450 B.C., enumerates in his account of his journey characteristics of the Egyptian people which exhibit an astonishing similarity to traits familiar to us in later Jewry: 'They are altogether more religious in every respect than any other people, and differ from them too in a number of their customs. Thus they practise circumcision, which they were the first to introduce, and on grounds of cleanliness. Further they have a horror of pigs, which is no doubt related to the fact that Seth in the form of a black pig wounded Horus. And lastly and most markedly, they hold cows in the greatest honour, and would never eat or sacrifice them, because this would offend Isis with her cow's horns. For that reason no Egyptian man or woman would ever kiss a Greek or use his knife or his spit or his cauldron or eat the flesh of an otherwise clean ox if it had been cut with a Greek knife . . . They look down in narrow-minded pride on other people, who are unclean and are not so close to the gods as they are.' (Erman, 1905, 181.) [This is a summary by Erman of Chapters 36 to 47 of Book II of Herodotus.] – We must not, of course, overlook parallels to this in the life of the Indian people. – And, incidentally, who suggested to the Jewish poet Heine in the nineteenth century A.D. that he should complain of his religion as 'the plague dragged along from the Nile valley, the unhealthy beliefs of ancient Egypt'? [From a poem on 'The New Jewish Hospital in Hamburg', *Zeitgedichte*, XI.]

Later on, however, Jewish tradition behaved as though it were put at a disadvantage by the inference we have been drawing. If it were to be admitted that circumcision was an Egyptian custom introduced by Moses, that would be almost as much as to recognize that the religion delivered to them by Moses was an Egyptian one too. There were good reasons for denying that fact, so the truth about circumcision must also be contradicted.

(4)

[31] At this point I expect to be met with an objection to my hypothesis. This placed Moses, an Egyptian, in the Akhenaten period. It derived his decision to take over the Jewish people from the political circumstances in the country at that time, and it recognized the religion that he presented to or imposed on his protégés as the Aten religion, which had actually collapsed in Egypt itself. I expect to be told that I have brought forward this structure of conjectures with too much positiveness, for which there is no basis in the material. This objection is, I think, unjustified. I have already laid stress on the factor of doubt in my introductory remarks; I have, as it were, placed that factor outside the brackets and I may be allowed to save myself the trouble of repeating it in connection with each item *inside* them.[1]

I may continue the discussion with a few critical remarks of my own. The kernel of my hypothesis – the dependence of Jewish monotheism on the monotheist episode in Egyptian history – has been suspected and mentioned by various writers. I spare myself the trouble of quoting these opinions here, since none of them is able to indicate how this influence can have come into operation. Even though in our view that influence remains linked to the figure of Moses, we ought also to mention some other possibilities in addition to the one we prefer. It must not be supposed that the fall of the official Aten religion brought the monotheist current in Egypt to a complete stop. The priesthood at On, from which it started, survived the catastrophe and may have continued to bring under the sway of its trend of ideas generations after Akhenaten's. Thus the action taken by Moses is still conceivable even if he did not live at the time of Akhenaten and did not fall under his personal influence, if he was only an adherent or perhaps a member of the priesthood of On. This possibility would postpone the date of the Exodus and bring it closer to the date which is usually adopted (in the

1 [This is a simile from algebra.]

thirteenth century); but it has nothing else to recommend it. Our insight into the motives of Moses would be lost and the facilitation of the Exodus by the prevailing anarchy in the country would no longer apply. [32]
The succeeding kings of the Nineteenth Dynasty established a strong regime. It was only during the period immediately after the heretic king's death that there was a convergence of all the conditions, external and internal alike, that were favourable to the Exodus.

The Jews possess a copious literature apart from the Bible, in which the legends and myths are to be found which grew up in the course of centuries round the imposing figure of their first leader and the founder of their religion, and which have both illuminated and obscured it. Scattered in this material there may be fragments of trustworthy tradition for which no room was found in the Pentateuch. A legend of this sort gives an engaging account of how the ambition of the man Moses found expression even in his childhood. Once when Pharaoh had taken him in his arms and playfully lifted him high in the air, the little three-year-old boy snatched the crown from the king's head and put it on his own. This portent alarmed the king, who did not fail to consult his wise men about it.[1] There are stories elsewhere of his victorious military actions as an Egyptian general in Ethiopia, and, in this connection, how he fled from Egypt because he had reason to be afraid of the envy of a party at court or of Pharaoh himself. The biblical account itself attributes some features to Moses to which credence may well be given. It describes him as being of an irascible nature, flaring up easily, as when, in indignation, he slew the brutal overseer who was ill-treating a Jewish workman, or when in his anger at the people's apostasy he broke the Tables of the Law which he had brought down from the Mount of God [Sinai];[2] indeed God himself punished him in the end for an impatient deed, but we are not told what it was.[3] Since a trait of this kind is not one that would serve for his glorification, it may perhaps correspond to a historical truth. Nor can the possibility be excluded that some of the character traits which the Jews included in their early picture of their God – describing him as jealous, severe and ruthless – may have been at [33]

1 This anecdote, in a slightly different form, also appears in Josephus. [*Jewish Antiquities*. English translation, 1930, 265 f.]

2 [*Exodus*, ii, 11–12; xxxii, 19.]

3 [If this is a reference to Moses, at the end of his life, not being allowed to enter the Promised Land (*Deuteronomy*, xxxiv, 4), the explanation was in fact that he had shown impatience by striking the rock with his rod to draw water instead of merely speaking to it (*Numbers*, xx, 11–12).]

bottom derived from a recollection of Moses; for, in fact, it was not an invisible God but the man Moses who brought them out of Egypt.

Another trait attributed to Moses has a special claim to our interest. Moses is said to have been 'slow of speech': he must have suffered from an inhibition or disorder of speech. Consequently, in his supposed dealings with Pharaoh, he needed the support of Aaron, who is called his brother.[1] This again may be a historical truth and would make a welcome contribution to presenting a lively picture of the great man. But it may also have another and more important significance. It may recall, slightly distorted, the fact that Moses spoke another language and could not communicate with his Semitic Neo-Egyptians without an interpreter, at all events at the beginning of their relations – a fresh confirmation, then, of the thesis that Moses was an Egyptian.

Now, however, or so it seems, our work has reached a provisional end. For the moment we can draw no further conclusions from our hypothesis that Moses was an Egyptian, whether or not it has been proved. No historian can regard the biblical account of Moses and the Exodus as anything other than a pious piece of imaginative fiction, which has recast a remote tradition for the benefit of its own tendentious purposes. The original form of that tradition is unknown to us; we should be glad to discover what the distorting purposes were, but we are kept in the dark by our ignorance of the historical events. The fact that our reconstruction leaves no room for a number of show-pieces in the Bible story, such as the ten plagues, the passage of the Red Sea and the solemn lawgiving on Mount Sinai – this does not disconcert us. But we cannot treat it as a matter of indifference if we find ourselves in contradiction to the findings of the sober historical researches of the present day.

These modern historians, of whom we may take Eduard Meyer (1906) as a representative, agree with the Bible story on one decisive point. They too are of the opinion that the Jewish tribes, which later developed into the people of Israel, took on a new religion at a certain point of time. But in their view this did not take place in Egypt or at the foot
[34] of a mountain in the Sinai Peninsula, but in a certain locality known as Meribah-Kadesh,[2] an oasis distinguished by its wealth of springs and wells in the stretch of country south of Palestine, between the eastern

1 [*Exodus*, iv, 10 and 14.]

2 [Throughout this work Freud uses the more technical phonetic spelling of the latter part of this name: Qadeš. We have adopted the ordinary English version.]

exit from the Sinai Peninsula and the western border of Arabia.[1] There they took over the worship of a god Yahweh,[2] probably from the neighbouring Arabian tribe of Midianites. It seems likely that other tribes in the vicinity were also followers of this god.

Yahweh was unquestionably a volcano god. Now, as is well known, Egypt is without volcanoes and the mountains of the Sinai Peninsula have never been volcanic; on the other hand, there are volcanoes which may have been active till recent times along the western border of Arabia. So one of these mountains must have been the Sinai-Horeb which was regarded as the home of Yahweh.[3] In spite of all the revisions to which the biblical story was subjected, the original picture of the god's character can, according to Eduard Meyer, be reconstructed: he was an uncanny, bloodthirsty demon who went about by night and shunned the light of day.[4]

The mediator between God and the people in the founding of this religion was named Moses. He was the son-in-law of the Midianite priest Jethro, and was keeping his flocks when he received the summons from God. He was also visited by Jethro at Kadesh and given some advice by him.[5]

Though Eduard Meyer says, it is true, that he never doubted that there was some historical core in the story of the sojourn in Egypt and the catastrophe to the Egyptians,[6] he evidently does not know how to place and what use to make of this fact which he recognizes. The only [35]
thing he is prepared to derive from Egypt is the custom of circumcision. He adds two important indications which go to confirm our previous arguments: first, that Joshua ordered the people to be circumcised in order to 'roll away the reproach [i.e. contempt] of Egypt from off you',[7] and secondly a quotation from Herodotus saying that 'the Phoenicians (no doubt the Jews) and the Syrians of Palestine themselves admit that

1 [Its precise position seems uncertain, but it was probably in what is now known as the Negev, on about the same latitude as Petra but some fifty miles further to the west. It is not to be confused with the better-known Kadesh in Syria, to the north of modern Israel, which was the scene of a much-boasted victory by Rameses II over the Hittites.]

2 [This is the usual English spelling. Freud uses the corresponding German one: 'Jahve'.]

3 At a few places in the biblical text it is still stated that Yahweh came down from Sinai to Meribah-Kadesh. [E.g. *Numbers*, xx, 6–9. – Sinai and Horeb are usually taken as different names of the same mountain.]

4 Meyer, 1906, 38 and 58.

5 [*Exodus*, iii, 1, and xviii, 2–27.]

6 Meyer, 1906, 49.

7 [*Joshua*, v, 9.]

they learnt the custom of the Egyptians'.[1] But he has little to say in favour of an Egyptian Moses: 'The Moses we know is the ancestor of the priests of Kadesh – that is, a figure from a genealogical legend, standing in relation to a cult, and not a historical personality. Thus (apart from those who accept tradition root and branch as historical truth) no-one who treats him as a historical figure has been able to give any content to him, to represent him as a concrete individual or to point out what he may have done and what his historical work may have been.'[2]

On the other hand, Meyer never tires of insisting on the relation of Moses to Kadesh and Midian: 'The figure of Moses, which is intimately bound up with Midian and the cult-centres in the desert. . . .'[3] and: 'This figure of Moses, then, is inseparably linked with Kadesh (Massah and Meribah[4]) and this is supplemented by his being the son-in-law of the Midianite priest. His link with the Exodus, on the contrary, and the whole story of his youth are entirely secondary and simply the consequence of the interpolation of Moses into a connected and continuous legendary story.'[5] Meyer also points out that the themes included in the story of the youth of Moses were one and all dropped later: 'Moses in Midian is no longer an Egyptian and grandson of Pharaoh, but a shepherd to whom Yahweh revealed himself. In telling of the plagues there is no longer any talk of his former connections, though effective use might easily have been made of them, and the command to kill the [newborn] sons of the Israelites[6] is completely forgotten. In the Exodus
[36] and the destruction of the Egyptians Moses plays no part whatever: he is not even mentioned. The heroic character which the legend of his childhood presupposes is totally absent from the later Moses; he is only the man of God, a miracle-worker equipped by Yahweh with supernatural powers.'[7]

We cannot dispute the impression that this Moses of Kadesh and Midian, to whom tradition could actually attribute the erection of a brazen serpent as a god of healing,[8] is someone quite other than the

aristocratic Egyptian inferred by us, who presented the people with a religion in which all magic and spells were proscribed in the strictest terms. Our Egyptian Moses is no less different, perhaps, from the Midianite Moses than is the universal god Aten from the demon Yahweh in his home on the Mount of God. And if we have any faith at all in the pronouncements of the recent historians, we shall have to admit that the thread which we have tried to spin from our hypothesis that Moses was an Egyptian has broken for the second time. And this time, as it seems, with no hope of mending.

(5)

Unexpectedly, here once more a way of escape presents itself. Efforts to see in Moses a figure that goes beyond the priest of Kadesh, and to confirm the grandeur with which tradition glorifies him, have not ceased even since Eduard Meyer. (Cf. Gressmann [1913] and others.) Then, in 1922, Ernst Sellin made a discovery which affected our problem decisively. He found in the Prophet Hosea (in the second half of the eighth century B.C.) unmistakable signs of a tradition to the effect that Moses, the founder of their religion, met with a violent end in a rising of his refractory and stiff-necked people, and that at the same time the religion he had introduced was thrown off. This tradition is not, however, restricted to Hosea; it reappears in most of the later Prophets, and indeed, according to Sellin, became the basis of all the later Messianic expectations. At the end of the Babylonian captivity a hope grew up among the Jewish people that the man who had been so shamefully murdered would return from the dead and would lead his remorseful people, and perhaps not them alone, into the kingdom of lasting bliss. The obvious connection of this with the destiny of the founder of a later religion does not concern us here. [37]

Once again I am not, of course, in a position to judge whether Sellin has interpreted the passages from the Prophets correctly. But if he is right we may attribute historical credibility to the tradition he has recognized, for such things are not readily invented. There is no tangible motive for doing so; but if they have really happened, it is easy to understand that people will be anxious to forget them. We need not accept all the details of the tradition. In Sellin's opinion Shittim, in the country east of the Jordan, is to be regarded as the scene of the attack on Moses. But we shall soon see that that region is not acceptable for our notions.

We will borrow from Sellin his hypothesis that the Egyptian Moses was murdered by the Jews and the religion he had introduced abandoned. This allows us to spin our threads further without contradicting the authentic findings of historical research. But apart from this we shall venture to maintain independence of the authorities and to 'proceed along our own track'. The Exodus from Egypt remains our starting point. A considerable number of people must have left the country with Moses; a small collection would not have seemed worthwhile to this ambitious man with his large aims in view. The immigrants had probably been living in Egypt long enough to have grown into quite a large population. But we shall certainly not be going wrong if we assume, with the majority of the authorities, that only a fraction of what was later to be the Jewish people had experienced the events in Egypt. In other words, the tribe that returned from Egypt joined up later, in the stretch of country between Egypt and Canaan, with other kindred tribes, which had been settled there for a considerable time. This union, from which sprang the people of Israel, found expression in the adoption of a new religion, common to all the tribes, the religion of Yahweh – an event which, according to Eduard Meyer [1906, 60 ff.], took place under Midianite influence at Kadesh. Thereafter, the people felt strong enough to undertake their invasion of the land of Canaan. It would not tally with this course of events to suppose that the catastrophe to Moses and his religion occurred in the country east of the Jordan; it must have happened long before the union of the tribes.

[38] There can be no doubt that very different elements came together in the construction of the Jewish people; but what must have made the greatest difference among these tribes was whether or not they had experienced the sojourn in Egypt and what followed it. Having regard to this point, we may say that the nation arose out of a union of two component parts; and it fits in with this that, after a short period of political unity, it split into two pieces – the kingdom of Israel and the kingdom of Judah. History is fond of reinstatements like this, where a later fusion is undone and an earlier separation re-emerges. The most impressive example of this was afforded, as is well known, by the Reformation, which, after an interval of over a thousand years, brought to light once more the frontier between the Germany which had at one time been Roman and the Germany which had remained independent. In the instance of the Jewish people it is not possible to point to such a faithful reproduction of the old state of things; our knowledge of those times is too uncertain to allow us to assert that the settled tribes were

once more to be found together in the Northern Kingdom and those who had returned from Egypt in the Southern Kingdom; but here too the later split cannot have been unrelated to the earlier joining up. The former Egyptians were probably fewer in numbers than the others, but showed themselves culturally the stronger. They exercised a more powerful influence on the further evolution of the people, because they brought along with them a tradition which the others lacked.

Perhaps they brought something else with them more tangible than a tradition. One of the greatest enigmas of Jewish prehistory is that of the origin of the Levites. They are traced back to one of the twelve tribes of Israel – that of Levi – but no tradition has ventured to say where that tribe was originally located or what portion of the conquered land of Canaan was allotted to it. They filled the most important priestly offices, but they were distinct from the priests. A Levite is not necessarily a priest; nor is it the name of a caste. Our hypothesis about the figure of Moses suggests an explanation. It is incredible that a great lord, like Moses the Egyptian, should have joined this alien people unaccompanied. He certainly must have brought a retinue with him – his closest followers, his scribes, his domestic servants. This is who the Levites originally were. The tradition which alleges that Moses was a Levite seems to be a clear distortion of the fact: the Levites were the [39]
followers of Moses. This solution is supported by the fact which I have already mentioned in my earlier essay that it is only among the Levites that Egyptian names occur later.[1] It is to be presumed that a fair number of these followers of Moses escaped the catastrophe which descended on him himself and the religion he founded. They multiplied in the course of the next generations, became fused with the people they lived among, but remained loyal to their master, preserved his memory and carried out the tradition of his doctrines. At the time of the union with the disciples of Yahweh they formed an influential minority, culturally superior to the rest.

I put it forward as a provisional hypothesis that between the fall of Moses and the establishment of the new religion at Kadesh two generations, or perhaps even a century, elapsed. I see no means of deciding whether the Neo-Egyptians (as I should like to call them here) – that is, those who returned from Egypt – met their tribal kinsmen after the latter had already adopted the Yahweh religion or earlier. The second

1 My hypothesis fits in well with Yahuda's statements on the Egyptian influence on early Jewish literature. See Yahuda, 1929. [This earlier mention is not to be found. It was no doubt dropped in the course of Freud's revisions of the book. See, however, the Editors' addition to a footnote on p. 17 above.]

possibility might seem the more probable. But there would be no difference in the outcome. What happened at Kadesh was a compromise, in which the share taken by the tribes of Moses is unmistakable.

Here we may once again call on the evidence afforded by circumcision, which has repeatedly been of help to us, like, as it were, a key-fossil. This custom became obligatory in the Yahweh religion as well and, since it was indissolubly linked with Egypt, its adoption can only have been a concession to the followers of Moses, who – or the Levites among them – would not renounce this mark of their holiness. [p. 29 above.] So much of their old religion they wished to rescue, and in return for it they were prepared to accept the new deity and what the priests of Midian told them about it. They may possibly have gained yet other concessions. We have already mentioned that Jewish ritual prescribed certain restrictions on the use of God's name. Instead of 'Yahweh' the word 'Adonai [Lord]' must be spoken. It is tempting to bring this
[40] prescription into our context, but that is only a conjecture without any other basis. The prohibition upon a god's name is, as is well known, a taboo of primaeval age. We do not understand why it was revived precisely in the Jewish Law; it is not impossible that this happened under the influence of a fresh motive. There is no need to suppose that the prohibition was carried through consistently; in the construction of theophorous personal names – that is, in compounds – the name of the God Yahweh might be freely used (e.g. Jochanan, Jehu, Joshua). There were, however, special circumstances connected with this name. As we know, critical biblical research supposes that the Hexateuch has two documentary sources.[1] These are distinguished as J and E, because one of them uses 'Jahve [Yahweh]' as the name of God and the other 'Elohim': 'Elohim', to be sure, not 'Adonai'. But we may bear in mind a remark by one of our authorities: 'The different names are a clear indication of two originally different gods.'[2]

We brought up the retention of circumcision as evidence for the fact that the founding of the religion at Kadesh involved a compromise. We can see its nature from the concordant accounts given by J and E, which thus go back on this point to a common source (a documentary or oral tradition). Its leading purpose was to demonstrate the greatness and power of the new god Yahweh. Since the followers of Moses attached so much value to their experience of the Exodus from Egypt, this act

1 [This is elaborated on p. 40 below.]

2 Gressmann, 1913, 54.

of liberation had to be represented as due to Yahweh, and the event was provided with embellishments which gave proof of the terrifying grandeur of the volcano god – such as the pillar of smoke [cloud] which changed at night into a pillar of fire and the storm which laid bare the bed of the sea for a while, so that the pursuers were drowned by the returning waters.[1] This account brought the Exodus and the founding of the religion close together, and disavowed the long interval between them. So, too, the lawgiving was represented as occurring not at Kadesh but at the foot of the Mount of God, marked by a volcanic eruption. This account, however, did grave injustice to the memory of the man Moses; it was he and not the volcano god who had liberated the people from Egypt. So a compensation was owing to him, and it consisted in the man Moses being transferred to Kadesh or to Sinai-Horeb and put in the place of the Midianite priests. We shall find later that this solu- [41]
tion satisfied another imperatively pressing purpose. In this manner a mutual agreement, as it were, was arrived at: Yahweh, who lived on a mountain in Midian, was allowed to extend over into Egypt, and, in exchange for this, the existence and activity of Moses were extended to Kadesh and as far as the country east of the Jordan. Thus he was fused with the figure of the later religious founder, the son-in-law of the Midianite Jethro [p. 34 above], and lent him his name of Moses. Of this second Moses, however, we can give no personal account – so completely was he eclipsed by the first, the Egyptian Moses – unless we pick out the contradictions in the biblical description of the character of Moses. He is often pictured as domineering, hot-tempered and even violent, yet he is also described as the mildest and most patient of men.[2] These last qualities would evidently have fitted in badly with the Egyptian Moses, who had to deal with his people in such great and difficult matters; they may have belonged to the character of the other Moses, the Midianite. We are, I think, justified in separating the two figures and in assuming that the Egyptian Moses was never at Kadesh and had never heard the name of Yahweh, and that the Midianite Moses had never been in Egypt and knew nothing of Aten. In order to solder the two figures together, tradition or legend had the task of bringing the Egyptian Moses to Midian, and we have seen that more than one explanation of this was current.

1 [*Exodus*, xiii, 21, and xiv, 21–8.]

2 [See, for instance, *Exodus*, xxxii, 19, and *Numbers*, xii, 3.]

(6)

Once again I am prepared to find myself blamed for having presented my reconstruction of the early history of the people of Israel with too great and unjustified certainty. I shall not feel very severely hit by this criticism, since it finds an echo in my own judgement. I know myself that my structure has its weak spots, but it has its strong points too. On the whole my predominant impression is that it is worthwhile to pursue the work in the direction it has taken.

The Bible narrative that we have before us contains precious and, indeed, invaluable historical data, which, however, have been distorted by the influence of powerful tendentious purposes and embellished by
[42] the products of poetic invention. In the course of our efforts so far, we have been able to detect one of these distorting purposes [pp. 38–9 above]. That discovery points our further path. We must uncover other similar tendentious purposes. If we find means of recognizing the distortions produced by those purposes, we shall bring to light fresh fragments of the true state of things lying behind them.

And we will begin by listening to what critical biblical research is able to tell us about the history of the origin of the Hexateuch, the five books of Moses and the book of Joshua, which alone concern us here.[1] The earliest documentary source is accepted as J (the Yahwistic writer), who in the most recent times has been identified as the priest Ebyatar, a contemporary of King David.[2] Somewhat – it is not known how much – later we come to the so-called Elohistic writer [E], who belonged to the Northern Kingdom.[3] After the collapse of the Northern Kingdom in 722 B.C., a Jewish priest combined portions of J and E and made some additions of his own. His compilation is designated as JE. In the seventh century *Deuteronomy*, the fifth book, was added to this. It is supposed to have been found complete in the Temple. In the period after the destruction of the Temple (586 B.C.), during and after the Exile, the revision known as the 'Priestly Code' was compiled; and in the fifth century the work was given its final revision and since then has not been changed in its essentials.[4]

1 *Encyclopaedia Britannica*, Eleventh Edition [Vol. III], 1910. Article 'Bible'.

2 See Auerbach (1932).

3 The Yahwistic and Elohistic writings were first distinguished by Astruc in 1753. [Jean Astruc (1684–1766) was a French physician attached to the Court of Louis XV.]

4 It is historically certain that the Jewish type was finally fixed as a result of the reforms of Ezra and Nehemiah in the fifth century before Christ – that is, after the Exile, under the Persian domination which was friendly to the Jews. On our reckoning, some nine hundred years had

The history of King David and of his period is most probably the work of a contemporary. It is genuine historical writing, five hundred years [43] before Herodotus, the 'father of History'. It becomes easier to understand this achievement if, on the lines of our hypothesis, we think of Egyptian influence.[1] A suspicion even arises that the Israelites of that earliest period – that is to say, the scribes of Moses – may have had some share in the invention of the first alphabet.[2] It is, of course, beyond our knowledge to discover how far reports about former times go back to early records or to oral tradition and how long an interval of time there was in individual instances between an event and its recording. The text, however, as we possess it today, will tell us enough about its own vicissitudes [*Schicksale*]. Two mutually opposed treatments have left their traces on it. On the one hand it has been subjected to revisions which have falsified it in the sense of their secret aims, have mutilated and amplified it and have even changed it into its reverse; on the other hand a solicitous piety has presided over it and has sought to preserve everything as it was, no matter whether it was consistent or contradicted itself. Thus almost everywhere noticeable gaps, disturbing repetitions and obvious contradictions have come about – indications which reveal things to us which it was not intended to communicate. In its implications the distortion of a text resembles a murder: the difficulty is not in perpetrating the deed, but in getting rid of its traces. We might well lend the word '*Entstellung* [distortion]' the double meaning to which it has a claim but of which today it makes no use. It should mean not only 'to change the appearance of something' but also 'to put something in another place, to displace'.[3] Accordingly, in many instances of textual distortion, we may nevertheless count upon finding what has been suppressed and disavowed hidden away somewhere else, though changed and torn from its context. Only it will not always be easy to recognize it.

The distorting purposes which we are anxious to lay hold of must

passed since the emergence of Moses. These reforms took seriously the regulations that aimed at making the entire people holy; their separation from their neighbours was made effective by the prohibition of mixed marriages; the Pentateuch, the true book of the laws, was given its final form and the revision known as the Priestly Code brought to completion. It seems certain, however, that these reforms introduced no fresh tendentious purposes, but took up and strengthened earlier trends.

1 Cf. Yahuda, 1929.

2 If they were subject to the prohibition against pictures they would even have had a motive for abandoning the hieroglyphic picture-writing while adapting its written characters to expressing a new language. (Cf. Auerbach, 1932.) [Hieroglyphic writing included both signs depicting objects and signs representing sounds.]

3 ['*Stelle*' means 'a place', and '*ent-*' is a prefix indicating a change of condition.]

have been at work already on the traditions before any of them were
[44] committed to writing. We have already discovered one of them, perhaps the most powerful of all. As we have said, with the setting up of the new god, Yahweh, at Kadesh, it became necessary to do something to glorify him. It would be more correct to say: it became necessary to fit him in, to make room for him, to wipe out the traces of earlier religions. This seems to have been achieved with complete success as regards the religion of the resident tribes: we hear nothing more of it. With those returning from Egypt it was not such an easy matter; they would not let themselves be deprived of the Exodus, the man Moses or circumcision. It is true that they had been in Egypt, but they had left it, and thenceforward every trace of Egyptian influence was to be disavowed
Verleugnung [*verleugnet*]T. The man Moses was dealt with by shifting him to Midian and Kadesh, and by fusing him with the priest of Yahweh who founded the religion. Circumcision, the most suspicious indication of dependence on Egypt, had to be retained but no attempts were spared to detach the custom from Egypt – all evidence to the contrary. It is only as a
Auffassung deliberate denial of the betraying fact that we can explain [*auffassen*]T the puzzling and incomprehensibly worded passage in *Exodus* [iv, 24–6], according to which on one occasion Yahweh was angry with Moses because he had neglected circumcision, and his Midianite wife saved his life by quickly carrying out the operation.[1] We shall presently come across another invention for making the uncomfortable piece of evidence harmless.

The fact that we find signs of efforts being made to deny explicitly that Yahweh was a new god, alien to the Jews, can scarcely be described as the appearance of a fresh tendentious purpose: it is rather a continuation of the former one. With this end in view the legends of the patriarchs of the people – Abraham, Isaac and Jacob – were introduced. Yahweh asserted that he was already the god of these forefathers; though it is true that he himself had to admit that they had not worshipped him under that name.[2] He does not add, however, what the other name was.

And here was the opportunity for a decisive blow against the Egyptian origin of the custom of circumcision: Yahweh, it was said, had already
[45] insisted on it with Abraham and had introduced it as the token of the covenant between him and Abraham.[3] But this was a particularly clumsy invention. As a mark that is to distinguish one person from others and

1 [Cf. p. 26 above.]

2 [Cf. *Exodus*, vi, 3.] This does not make the restrictions upon the use of this new name more intelligible, though it does make them more suspect.

3 [*Genesis*, xvii, 9–14.]

prefer him to them, one would choose something that is not to be found in other people; one would *not* choose something that can be exhibited in the same way by millions of other people. An Israelite who was transplanted to Egypt would have had to acknowledge every Egyptian as a brother in the covenant, a brother in Yahweh. It is impossible that the Israelites who created the text of the Bible can have been ignorant of the fact that circumcision was indigenous in Egypt. The passage in Joshua [v, 9] quoted by Eduard Meyer [see p. 33 above] admits this without question; but for that very reason it had to be disavowed at any price.

We must not expect the mythical structures of religion to pay too much attention to logical coherence. Otherwise popular feeling might have taken justified offence against a deity who made a covenant with their forefathers with mutual obligations and then, for centuries on end, paid no attention to his human partners, till it suddenly occurred to him to manifest himself anew to their descendants. Even more puzzling is the notion of a god's all at once 'choosing' a people, declaring them to be his people and himself to be their god. I believe this is the only instance of its sort in the history of human religions. Ordinarily god and people are indissolubly linked, they are one from the very beginning of things. No doubt we sometimes hear of a people taking on a different god, but never of a god seeking a different people. We may perhaps understand this unique event better if we recall the relations between Moses and the Jewish people. Moses had stooped to the Jews, had made them his people: they were his 'chosen people'.[1]

1 Yahweh was undoubtedly a volcano god. There was no occasion for the inhabitants of Egypt to worship him. I am certainly not the first person to be struck by the resemblance of the sound of the name 'Yahweh' to the root of the other divine name 'Jupiter (Jove)'. [The letter 'j' in German is pronounced like the English 'y'.] The name 'Jochanan' is compounded with an abbreviation of the Hebrew Yahweh – in the same kind of way as [the German] 'Gotthold [God is gracious]' and the Carthaginian equivalent 'Hannibal'. This name (Jochanan), in the forms 'Johann', 'John', 'Jean', 'Juan', has become the favourite first name in European Christendom. The Italians, in rendering it 'Giovanni' and moreover calling a day of the week 'Giovedi [Thursday]', are bringing to light a resemblance which may possibly mean nothing or possibly a very great deal. At this point, extensive but very uncertain prospects open up before us. It seems that, in those obscure centuries which are scarcely accessible to historical research, the countries round the eastern basin of the Mediterranean were the scene of frequent and violent volcanic eruptions, which must have made the strongest impression on their inhabitants. Evans assumes that the final destruction of the palace of Minos at Knossos too was the consequence of an earthquake. In Crete at that period (as probably in the Aegean world in general) the great mother goddess was worshipped. The realization that she was not able to protect her house against the assaults of a stronger power may have contributed to her having to give place to a male deity, and, if so, the volcano god had the first claim to take her place. After all, Zeus always remains the 'earth-shaker'. There is little doubt that it was during those obscure ages that the mother goddesses were replaced by male gods (who may originally perhaps have been sons). The destiny of Pallas Athene, who was no doubt the local form of the mother goddess, is particularly impressive. She was reduced to being a daughter by the religious revolution, she was robbed of her own mother and, by having virginity imposed on her, was permanently excluded from motherhood. [On the mother goddesses, see below, p. 77.]

[46] The bringing in of the patriarchs served yet another purpose. They had lived in Canaan, and their memory was linked with particular localities in that country. It is possible that they were themselves originally Canaanite heroes or local divinities, and were then seized on by the immigrant Israelites for their prehistory. By appealing to the patriarchs they were as it were asserting their indigenous character and defending themselves from the odium attaching to an alien conqueror. It was a clever twist to declare that the god Yahweh was only giving them back what their forefathers had once possessed.

In the later contributions to the text of the Bible the intention was put into effect of avoiding the mention of Kadesh. The place at which the religion was founded was fixed once and for all as the Mount of God, Sinai-Horeb. It is not easy to see the motive for this; perhaps people were unwilling to be reminded of the influence of Midian. But all later distortions, especially of the period of the Priestly Code, had another aim in view. There was no longer any need to alter accounts of events in a desired sense – for this had been done long before. But care was taken to shift back commands and institutions of the present day into early times – to base them, as a rule, on the Mosaic lawgiving – so as to
[47] derive from this their claim to being holy and binding. However much the picture of the past might in this way be falsified, the procedure was not without a certain psychological justification. It reflected the fact that in the course of long ages – between the Exodus from Egypt and the fixing of the text of the Bible under Ezra and Nehemiah some eight hundred years elapsed – the Yahweh religion had had its form changed back into conformity, or even perhaps into identity, with the original religion of Moses.

And this is the essential outcome, the momentous substance, of the history of the Jewish religion.

(7)

Of all the events of early times which later poets, priests and historians undertook to work over, one stood out, the suppression of which was enjoined by the most immediate and best human motives. This was the murder of Moses, the great leader and liberator, which Sellin discovered from hints in the writings of the Prophets. Sellin's hypothesis cannot be called fantastic – it is probable enough. Moses, deriving from the school of Akhenaten, employed no methods other than did the king; he commanded, he forced his faith upon the people.[1] The doctrine of Moses

1 At that period any other method of influencing them was scarcely possible.

may have been even harsher than that of his master. He had no need to retain the sun god as a support: the school of On had no significance for his alien people. Moses, like Akhenaten, met with the same fate that awaits all enlightened despots. The Jewish people under Moses were just as little able to tolerate such a highly spiritualized[1] religion and find satisfaction of their needs in what it had to offer as had been the Egyptians of the Eighteenth Dynasty. The same thing happened in both cases: those who had been dominated and kept in want rose and threw off the burden of the religion that had been imposed on them. But while the tame Egyptians waited till fate had removed the sacred figure of their Pharaoh, the savage Semites took fate into their own hands and rid themselves of their tyrant.[2]

Nor can it be maintained that the surviving text of the Bible gives us [48] no warning of such an end to Moses. The account of the 'wandering in the wilderness',[3] which may stand for the period during which Moses ruled, describes a succession of serious revolts against his authority which were also, by Yahweh's command, suppressed with bloody punishment. It is easy to imagine that one such rebellion ended in a way different from what the text suggests. The people's defection from the new religion is also described in the text – only as an episode, it is true: namely in the story of the golden calf. In this, by an ingenious turn, the breaking of the Tables of the Law (which is to be understood symbolically: 'he has broken the law') is transposed on to Moses himself, and his furious indignation is assigned as its motive.[4]

There came a time when people began to regret the murder of Moses and to seek to forget it. This was certainly so at the time of the union of the two portions of the people at Kadesh. But when the Exodus and the foundation of the religion at the oasis [of Kadesh] were brought closer together [pp. 38–9 above], and Moses was represented as being concerned in the latter instead of the other man [the Midianite priest], not only were the demands of the followers of Moses satisfied but the distressing fact of his violent end was successfully disavowed. In actual fact it is most unlikely that Moses could have taken part in the proceedings at Kadesh even if his life had not been cut short.

1 [*'vergeistigte.'* See below, Essay III, Part II (C), and p. 79 *n.*]

2 It is really remarkable how little we hear in the thousands of years of Egyptian history of the violent removal or murder of a Pharaoh. A comparison with Assyrian history, for instance, must increase our surprise at this. It may, of course, be accounted for by the fact that Egyptian history was entirely written to serve official ends.

3 [*Numbers*, xiv, 33.]

4 [*Exodus*, xxxii, 19.]

We must now make an attempt at elucidating the chronological relations of these events. We have put the Exodus in the period after the end of the Eighteenth Dynasty (1350 B.C.). It may have occurred then or a little later, since the Egyptian chroniclers have included the succeeding years of anarchy in the reign of Haremhab, which brought them to an end and lasted till 1315 B.C. The next (but also the only) fixed point for the chronology is afforded by the stela of [the Pharaoh] Merenptah (1225–15 B.C.), which boasts of his victory over Isiraal (Israel) and the laying waste of her seed (?). The sense to be attached to this inscription
[49] is unfortunately doubtful, it is supposed to prove that the Israelite tribes were already at that time settled in Canaan.[1] Eduard Meyer rightly concludes from this stela that Merenptah cannot have been the Pharaoh of the Exodus, as had been lightly assumed previously. The date of the Exodus must have been earlier. The question of who was the Pharaoh of the Exodus seems to me altogether an idle one. There was no Pharaoh of the Exodus, for it occurred during an interregnum. Nor does the discovery of the stela of Merenptah throw any light on the possible date of the union and founding of the religion at Kadesh. All that we can say with certainty is that it was some time between 1350 and 1215 B.C. We suspect that the Exodus comes somewhere very near the beginning of this hundred years and the events at Kadesh not too far away from its end. We should like to claim the greater part of this period for the interval between the two occurrences. For we need a comparatively long time for the passions of the returning tribes to have cooled down after the murder of Moses and for the influence of his followers, the Levites, to have become as great as is implied by the compromise at Kadesh. Two generations, sixty years, might about suffice for this, but it is a tight fit. What is inferred from the stela of Merenptah comes too early for us, and since we recognize that in this hypothesis of ours one supposition is only based on another, we must admit that this discussion reveals a weak side of our construction. It is unlucky that everything relating to the settlement of the Jewish people in Canaan is so obscure and confused. Our only resort, perhaps, is to suppose that the name on the 'Israel' stela does not relate to the tribes whose fortunes we are trying to follow and which combined to form the later people of Israel. After all, the name of 'Habiru' (Hebrews) was transferred to these same people in the Amarna period [pp. 28–9 above].

The union of the tribes into a nation through the adoption of a common religion, whenever it may have taken place, might easily have

1 Eduard Meyer, 1906, 222 ff.

turned out quite an unimportant happening in world history. The new religion would have been carried away by the current of events, Yahweh would have had to take his place in the procession of departed gods in Flaubert's vision,[1] and all twelve of his tribes would have been 'lost' and not only the ten of them which the Anglo-Saxons have been in search of for so long. The god Yahweh, to whom the Midianite Moses then [50] presented a new people, was probably in no respect a prominent being. A coarse, narrow-minded, local god, violent and bloodthirsty, he had promised his followers to give them 'a land flowing with milk and honey'[2] and urged them to exterminate its present inhabitants 'with the edge of the sword'.[3] It is astonishing how much remains, in spite of all the revisions of the biblical narratives, that allows us to recognize his original nature. It is not even certain that his religion was a genuine monotheism, that it denied the divinity of the deities of other peoples. It was enough probably that his people regarded their own god as more powerful than any foreign god. If, nevertheless, in the sequel everything took a different course from what such beginnings would have led one to expect, the cause can be found in only one fact. The Egyptian Moses had given to one portion of the people a more highly spiritualized notion of god, the idea of a single deity embracing the whole world, who was not less all-loving than all-powerful, who was averse to all ceremonial and magic and set before men as their highest aim a life in truth and justice. For, however incomplete may be the accounts we have of the ethical side of the Aten religion, it can be no unimportant fact that Akhenaten regularly referred to himself in his inscriptions as 'living in Ma'at' (truth, justice).[4] In the long run it made no difference that the people rejected the teaching of Moses (probably after a short time) and killed him himself. The *tradition* of it remained and its influence achieved (only gradually, it is true, in the course of centuries) what was denied to Moses himself. The god Yahweh had arrived at undeserved honour when, from the time of Kadesh onwards, he was credited with the deed of liberation which had been performed by Moses; but he had to pay heavily for this usurpation. The shadow of the god whose place he had taken became stronger than himself; by the end of the process of evolution, the nature of the forgotten god of Moses had come to light behind

1 [In *La tentation de Saint Antoine*, Part V of the final version (1894).]

2 [*Exodus*, iii, 8.]

3 [*Deuteronomy*, xiii, 15.]

4 His hymns lay stress not only on the god's universality and oneness, but also on his loving care for all creatures; and they encourage joy in nature and enjoyment of its beauty. (Breasted, 1934, [281–302].)

his own. No-one can doubt that it was only the idea of this other god
[51] that enabled the people of Israel to survive all the blows of fate and that kept them alive to our own days.

It is no longer possible to estimate the share taken by the Levites in the final victory of the Mosaic god over Yahweh. They had taken the side of Moses in the past, when the compromise was reached at Kadesh, in a still live memory of the master whose retinue and compatriots they had been. During the centuries since then they had become merged with the people or with the priesthood, and it had become the main function of the priests to develop and supervise the ritual, and besides this to preserve the holy writ and revise it in accordance with their aims. But was not all sacrifice and all ceremonial at bottom only magic and sorcery, such as had been unconditionally rejected by the old Mosaic teaching? Thereupon there arose from among the midst of the people an unending succession of men who were not linked to Moses in their origin but were enthralled by the great and mighty tradition which had grown up little by little in obscurity: and it was these men, the Prophets, who tirelessly preached the old Mosaic doctrine – that the deity disdained sacrifice and ceremonial and asked only for faith and a life in truth and justice (Ma'at). The efforts of the Prophets had a lasting success; the doctrines with which they re-established the old faith became the permanent content of the Jewish religion. It is honour enough to the Jewish people that they could preserve such a tradition and produce men who gave it a voice – even though the initiative to it came from outside, from a great foreigner.

I should not feel secure in giving this account, if I could not appeal to the judgement of other enquirers with a specialist knowledge who see the significance of Moses for the Jewish religion in the same light as I do, even though they do not recognize his Egyptian origin. Thus, for instance, Sellin (1922, 52) writes: 'Consequently we must picture the true religion of Moses – his belief in the one moral God whom he preaches – as thenceforward necessarily the property of a small circle of the people. We must necessarily not expect to meet with it in the official cult, in the religion of the priests or in the beliefs of the people. We can necessarily only reckon to find an occasional spark emerging, now here and now there, from the spiritual torch which he once kindled, to find that his ideas have not entirely perished but have been silently at work
[52] here and there upon beliefs and customs, till sooner or later, through the effect of special experiences or of persons specially moved by his spirit, it has broken out more strongly once more and gained influence

on wider masses of the population. It is from this point of view that the history of the ancient religion of Israel is necessarily to be regarded. Anyone who sought to construct the Mosaic religion on the lines of the religion we meet with, according to the chronicles, in the life of the people during their first five hundred years in Canaan, would be committing the gravest methodological error.' Volz (1907, 64) speaks even more clearly: it is his belief that 'the exalted work of Moses was understood and carried through to begin with only feebly and scantily, till, in the course of centuries, it penetrated more and more, and at length in the great Prophets it met with like spirits who continued the lonely man's work.'

And here, it seems, I have reached the conclusion of my study, which was directed to the single aim of introducing the figure of an Egyptian Moses into the nexus of Jewish history. Our findings may be thus expressed in the most concise formula. Jewish history is familiar to us for its dualities: *two* groups of people who came together to form the nation, *two* kingdoms into which this nation fell apart, *two* gods' names in the documentary sources of the Bible. To these we add two fresh ones: the foundation of *two* religions – the first repressed [*verdrängt*]^{T} *Verdrängung* by the second but nevertheless later emerging victoriously behind it, and *two* religious founders, who are both called by the same name of Moses and whose personalities we have to distinguish from each other. All of these dualities are the necessary consequences of the first one: the fact that one portion of the people had an experience which must be regarded as traumatic and which the other portion escaped. Beyond this there would be a very great deal to discuss, to explain and to assert. Only thus would an interest in our purely historical study find its true justification. What the real nature of a tradition resides in, and what its special power rests on, how impossible it is to dispute the personal influence upon world history of individual great men, what sacrilege one commits against the splendid diversity of human life if one recognizes only those motives [*Motive*]^{T} which arise from material needs, from what sources some ideas (and particularly religious ones) derive their power [*Kraft*]^{T} to subject both men and peoples to their [53] yoke – to study all this in the special case of Jewish history would be an alluring task. To continue my work on such lines as these would be to find a link with the statements I put forward twenty-five years ago in *Totem and Taboo* [1912–13*a*; *RSE*, **13**]. But I no longer feel that I have the strength to do so.

III
MOSES, HIS PEOPLE AND MONOTHEIST RELIGION

PART I

PREFATORY NOTE I

([Vienna], before March, 1938)

[54] With the audacity of one who has little or nothing to lose, I propose for a second time to break a well-grounded intention and to add to my two essays on Moses in *Imago*[1] the final portion which I have held back. I ended the last essay with an assertion that I knew my strength would not be enough for this. By that I meant, of course, the weakening of creative powers which goes along with old age;[2] but I was thinking of another obstacle as well.

We are living in a specially remarkable period. We find to our astonishment that progress has allied itself with barbarism. In Soviet Russia they have set about improving the living conditions of some hundred millions of people who were held firmly in subjection. They have been rash enough to withdraw the 'opium' of religion from them and have been wise enough to give them a reasonable amount of sexual liberty; but at the same time they have submitted them to the most cruel coercion and robbed them of any possibility of freedom of thought. With similar violence, the Italian people are being trained up to orderliness and a sense of duty. We feel it as a relief from an oppressive apprehension when we see in the case of the German people that a relapse into almost prehistoric barbarism can occur as well without being attached
[55] [*ohne Anlehnung*][T] to any progressive ideas. In any case, things have so turned out that today the conservative democracies have become the

1 [Essays I and II above.]

2 I do not share the opinion of my contemporary Bernard Shaw, that human beings would only achieve anything good if they could live to be three hundred years old. A prolongation of life would achieve nothing unless many other fundamental changes were to be made in the conditions of life. [Cf. Shaw's *Back to Methuselah*.]

guardians of cultural advance and that, strange to say, it is precisely the institution of the Catholic Church which puts up a powerful defence against the spread of this danger to civilization – the Church which has hitherto been the relentless foe to freedom of thought and to advances towards the discovery of the truth!

We are living here in a Catholic country under the protection of that Church, uncertain how long that protection will hold out. But so long as it lasts, we naturally hesitate to do anything that would be bound to arouse the Church's hostility. This is not cowardice, but prudence. The new enemy, to whom we want to avoid being of service, is more dangerous than the old one with whom we have already learnt to come to terms. The psychoanalytic researches which we carry on are in any case viewed with suspicious attention by Catholicism. I will not maintain that this is unjustly so. If our work leads us to a conclusion which reduces religion to a neurosis of humanity and explains its enormous power in the same way as a neurotic compulsion [*Zwang*][T] in our individual patients, we may be sure of drawing the resentment of our ruling powers down upon us. Not that I should have anything to say that would be new or that I did not say clearly a quarter of a century ago:[1] but it has been forgotten in the meantime and it could not be without effect if I repeated it today and illustrated it from an example which offers a standard for all religious foundations. It would probably lead to our being prohibited from practising psychoanalysis. Such violent methods of suppression are, indeed, by no means alien to the Church; the fact is rather that it feels it as an invasion of its privileges if someone else makes use of those methods. But psychoanalysis, which in the course of my long life has gone everywhere, still possesses no home that could be more valuable for it than the city in which it was born and grew up.

I do not only think but I *know* that I shall let myself be deterred by this second obstacle, by the external danger, from publishing the last portion of my study on Moses. I have made yet another attempt to get the difficulty out of the way, by telling myself that my fears are based on an overestimation of my own personal importance: that it will probably be [56]
a matter of complete indifference to the authorities what I choose to write about Moses and the origin of monotheist religions. But I feel uncertain in my judgement of this. It seems to me much more possible that malice and sensationalism will counterbalance any lack of

1 [In *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 11 ff.]

recognition of me in the contemporary world's judgement. So I shall not give this work to the public. But that need not prevent my writing it. Especially as I have written it down already once, two years ago,[1] so that I have only to revise it and attach it to the two essays that have preceded it. It may then be preserved in concealment till some day the time arrives when it may venture without danger into the light, or till someone who has reached the same conclusions and opinions can be told: 'there was someone in darker times who thought the same as you!'

1 [Freud in fact wrote part of it originally *four* years previously, in 1934, but seems to have given it a major revision in 1936. See above, pp. 3–4.]

PREFATORY NOTE II

([London], June, 1938)

The quite special difficulties which have weighed on me during my composition of this study relating to the figure of Moses – internal doubts as well as external obstacles – have resulted in this third and concluding essay being introduced by two different Prefaces, which contradict each other and indeed cancel each other out. For in the short space of time between the two there has been a fundamental change in the author's circumstances. At the earlier date I was living under the protection of the Catholic Church, and was afraid that the publication of my work would result in the loss of that protection and would conjure up a prohibition upon the work of the adherents and students of psychoanalysis in Austria. Then, suddenly, came the German invasion and Catholicism proved, to use the words of the Bible, 'a broken reed'. In the certainty that I should now be persecuted not only for my line of thought but also for my 'race' – accompanied by many of my friends, I left the city which, from my early childhood, had been my home for seventy-eight years. [57]

I met with the friendliest reception in lovely, free, magnanimous England. Here I now live, a welcome guest; I can breathe a sigh of relief now that the weight has been taken off me and that I am once more able to speak and write – I had almost said 'and think' – as I wish or as I must. I venture to bring the last portion of my work before the public.

There are no external obstacles remaining, or at least none to be frightened of. In the few weeks of my stay here I have received countless greetings from friends who were pleased at my arrival, and from unknown and indeed uninvolved strangers who wanted only to give expression to their satisfaction at my having found freedom and safety here. And in addition there arrived, with a frequency surprising to a foreigner, communications of another sort, which were concerned with the state of my soul, which pointed out to me the way of Christ and sought to enlighten me on the future of Israel. The good people who wrote in this way cannot have known much about me; but I expect that when this work about Moses becomes known, in a translation, among my new compatriots, I shall forfeit enough of the sympathy which a number of other people as well now feel for me. [58]

As regards *internal* difficulties, a political revolution and a change of domicile could alter nothing. No less than before, I feel uncertain in the face of my own work; I lack the consciousness of unity and of belonging together which should exist between an author and his work. It is not as though there were an absence of conviction in the correctness of my conclusion. I acquired that a quarter of a century ago when in 1912 I wrote my book about *Totem and Taboo*, and it has only grown firmer since. From that time I have never doubted that religious phenomena are only to be understood on the pattern of the individual neurotic symptoms familiar to us – as the return of long since forgotten, important events in the primaeval history of the human family – and that they have to thank precisely this origin for their compulsive character and that, accordingly, they are effective on human beings by force of the *historical* truth[1] of their content. My uncertainty sets in only when I ask myself whether I have succeeded in proving these theses in the example which I have chosen here of Jewish monotheism. To my critical sense this book, which takes its start from the man Moses, appears like a dancer balancing on the tip of one toe. If I could not find support in an analytic interpretation of the exposure myth and could not pass from there to Sellin's suspicion about the end of Moses, the whole thing would have had to remain unwritten. In any case, let us now take the plunge.

1 [See below, p. 116 ff.]

A. THE HISTORICAL PREMISE[1]

Here, then, is the historical background of the events which have [59]
absorbed our interest. As a result of the conquests of the Eighteenth Dynasty, Egypt became a world empire. The new imperialism was reflected in the development of the religious ideas, if not of the whole people, at least of its ruling and intellectually active upper stratum. Under the influence of the priests of the sun god at On (Heliopolis), strengthened perhaps by impulses from Asia, the idea arose of a universal god Aten to whom restriction to a single country and a single people no longer applied. In the young Amenophis IV a Pharaoh came to the throne who had no higher interest than the development of this idea of a god. He promoted the religion of Aten into the state religion, and through him the universal god became the *only* god: everything that was told of other gods was deceit and lies. With magnificent inflexibility he resisted every temptation to magical thought, and he rejected the illusion, so dear to Egyptians in particular, of a life after death. In an astonishing presentiment of later scientific discovery he recognized in the energy of solar radiation the source of all life on earth and worshipped it as the symbol of the power of his god. He boasted of his joy in the creation and of his life in Ma'at (truth and justice).

This is the first and perhaps the clearest case of a monotheist religion in human history; a deeper insight into the historical and psychological determinants of its origin would be of immeasurable value. Care has, however, been taken that not too much information about the Aten religion should reach us. Already under Akhenaten's feeble successors all that he had created collapsed. The vengeance of the priesthood which he had suppressed raged against his memory; the Aten religion was abolished, the capital city of the Pharaoh, who was branded as a criminal, was destroyed and plundered. In about 1350 B.C. the Eighteenth [60]
Dynasty came to an end; after a period of anarchy, order was restored by General Haremhab, who reigned till 1315 B.C. Akhenaten's reform seemed to be an episode doomed to be forgotten.

Thus far what is established historically; and now our hypothetical sequel begins. Among those in Akhenaten's entourage there was a man

1 I begin with a résumé of the findings of my second study on Moses, the purely historical one. Those findings will not be submitted here to any fresh criticism, since they form the premise to the psychological discussions which start out from them and constantly go back to them.

who was perhaps called Tuthmosis, like many other people at that time[1] – the name is not of great importance except that its second component must have been '–mose'. He was in a high position and a convinced adherent of the Aten religion, but, in contrast to the meditative king, he was energetic and passionate. For him the death of Akhenaten and the abolition of his religion meant the end of all his expectations. He could remain in Egypt only as an outlaw or as a renegade. Perhaps as governor of the frontier province he had come in contact with a Semitic tribe which had immigrated into it a few generations earlier. Under the necessity of his disappointment and loneliness he turned to these foreigners and with them sought compensation for his losses. He chose them as his people and tried to realize his ideals in them. After he had left Egypt with them, accompanied by his followers, he made them holy by the mark of circumcision, gave them laws and introduced them into the doctrines of the Aten religion, which the Egyptians had just thrown off. The precepts which this man Moses gave to his Jews may have been even harsher than those of his master and teacher Akhenaten, and he may, too, have given up dependence on the sun god of On, to which Akhenaten had continued to adhere.

We must take the period of the interregnum after 1350 B.C. as the date of the Exodus from Egypt. The interval of time which followed, up to the completion of the occupation of the land of Canaan, is particularly inscrutable. Modern historical research has been able to extract two facts from the obscurity which the biblical narrative has left, or rather created, at this point. The first of these facts, discovered by Ernst Sellin, is that the Jews, who, even by the account in the Bible, were headstrong and unruly towards their lawgiver and leader, rose against
[61] him one day, killed him and threw off the religion of the Aten which had been imposed on them, just as the Egyptians had thrown it off earlier. The second fact, demonstrated by Eduard Meyer, is that those Jews who had returned from Egypt united later on with closely related tribes in the region between Palestine, the Sinai Peninsula and Arabia, and that there, in a well-watered locality named Kadesh, under the influence of the Arabian Midianites, they took on a new religion, the worship of the volcano god Yahweh. Soon after this they were ready to invade Canaan as conquerors.

The chronological relations of these two events to each other and to the Exodus from Egypt are very uncertain. The closest historical point of reference is provided by a stela of the Pharaoh Merenptah (who

1 Such as, for instance, the sculptor whose studio was found at Tell el-'Amarna.

reigned till 1215 B.C.) which in the course of a report on campaigns in Syria and Palestine names 'Israel' among the defeated enemy. If we take the date of this stela as a *terminus ad quem*, we are left with about a century (from after 1350 to before 1215 B.C.) for the whole course of events, starting from the Exodus. It is possible, however, that the name 'Israel' did not yet relate to the tribes whose fortunes we are following and that in fact we have a longer interval at our disposal. The settlement in Canaan of what was later the Jewish people was certainly no rapidly completed conquest but took place in waves and over considerable periods of time. If we free ourselves from the limitation imposed by the Merenptah stela, we can all the more easily assign one generation (thirty years) to the period of Moses,[1] and allow at least two generations, but probably more, to elapse up to the time of the union at Kadesh.[2] The interval between Kadesh and the irruption into Canaan need only be short. The Jewish tradition, as was shown in the preceding essay [p. 45 above], had good grounds for shortening the interval between the Exodus and the founding of the religion at Kadesh, while the reverse is in the interest of our account.

All this, however, is still history, an attempt to fill in the gaps in our historical knowledge and in part a repetition of my second essay in *Imago* [Essay II above]. Our interest follows the fortunes of Moses and of his doctrines, to which the rising of the Jews had only apparently put [62] an end. From the account given by the Yahwist, which was written down in about 1000 B.C. but was certainly based on earlier records [*Fixierungen*],[3] we have discovered that the union and the founding of the religion at Kadesh were accompanied by a compromise in which the two sides are still easily distinguishable. The one partner was only concerned to disavow the novelty and foreign character of the god Yahweh and to increase his claim to the people's devotion; the other partner was anxious not to sacrifice to him precious memories of the liberation from Egypt and of the grand figure of the leader, Moses. The second side succeeded, too, in introducing both the fact and the man into the new account of prehistory, in retaining at least the external mark of the religion of Moses – circumcision – and possibly in establishing certain restrictions on the use of the name of the new god. As we have said, the

1 This would correspond to the forty years of wandering in the wilderness of the Bible text [*Numbers*, xiv, 33].

2 Thus we should have about 1350 (or 1340)–1320 (or 1310) B.C. for the Moses period; 1260 B.C., or preferably later, for Kadesh; the Merenptah stela before 1215 B.C.

3 [The word is not used here in the usual psychoanalytic sense of 'fixations'. See, however, a footnote to Chapter IV of *An Outline of Psychoanalysis* (1940*a* [1938]), p. 145 *n.* below.]

representatives of these claims were the descendants of the followers of Moses, the Levites, who were separated from his contemporaries and compatriots by only a few generations and were still attached to his memory by a living recollection. The poetically embellished narrative which we attribute to the Yahwist, and to his later rival the Elohist, were like mausoleums beneath which, withdrawn from the knowledge of later generations, the true account of those early things – of the nature of the Mosaic religion and of the violent end of the great man – was, as it were, to find its eternal rest. And if we have guessed what happened correctly, there is nothing left about it that is puzzling; but it might very well have signified the final end of the Moses episode in the history of the Jewish people.

The remarkable thing, however, is that that was not the case – that the most powerful effects of the people's experience were to come to light only later and to force their way into reality in the course of many centuries. It is unlikely that Yahweh differed much in character from the gods of the surrounding peoples and tribes. It is true that he struggled with them, just as the peoples themselves fought with one another, but we cannot suppose that it came into the head of a Yahweh worshipper
[63] of those days to deny the existence of the gods of Canaan or Moab or Amalek, and so on, any more than to deny the existence of the peoples who believed in them.

The monotheist idea, which had flared up with Akhenaten, had grown dark once more and was to remain in darkness for a long time to come. Finds on the island of Elephantine, just below the First Cataract of the Nile, have given us the surprising information that a Jewish military colony had been settled there for centuries, in whose temple, alongside of the chief god Yahu, two female deities were worshipped, one of them named Anat-Yahu. These Jews, it is true, were cut off from their mother country and had not taken part in the religious development there; the Persian government of Egypt (of the fifth century B.C.) conveyed information to them of the new rules of worship issued from Jerusalem.[1] Going back to earlier times, we may say that the god Yahweh certainly bore no resemblance to the Mosaic god. Aten had been a pacifist like his representative on earth – or more properly, his prototype – the Pharaoh Akhenaten, who looked on passively while the world empire conquered by his ancestors fell to pieces. No doubt Yahweh was better suited to a people who were starting out to occupy new homelands by force. And everything in the Mosaic god that deserved admiration was quite beyond the comprehension of the primitive masses.

1 Auerbach, **2**, 1936.

I have already said – and on that point I have been glad to be able to claim agreement with other writers – that the central fact of the development of the Jewish religion was that in the course of time the god Yahweh lost his own characteristics and grew more and more to resemble the old god of Moses, the Aten. It is true that differences remained to which one would be inclined at first glance to attribute great importance; but these can easily be explained.

In Egypt Aten had begun to dominate during a fortunate period of established possession, and even when the empire began to totter, his worshippers had been able to turn away from the disturbance and continued to praise and to enjoy his creations. The Jewish people were fated to experience a series of grave trials and painful events; their god became harsh and severe and, as it were, wrapped in gloom. He retained the characteristic of being a universal god, reigning over all countries and peoples, but the fact that his worship had passed over from the Egyp- [64]
tians to the Jews found expression in the additional belief that the Jews were his chosen people whose special obligations would eventually meet with a special reward as well. It may not have been easy for the people to reconcile a belief in being preferred by their omnipotent god with the sad experiences of their unfortunate destiny. But they did not allow themselves to be shaken in their convictions; they increased their own sense of guilt in order to stifle their doubts of God, and it may be that they pointed at last to the 'inscrutable decrees of Providence', as pious people do to this day. If they felt inclined to wonder at his allowing one violent aggressor after another to arise and overthrow and maltreat them – Assyrians, Babylonians, Persians – they could yet recognize his power in the fact that all these evil foes were themselves conquered in turn and that their empires vanished.

In three important respects the later god of the Jews became in the end like the old Mosaic god. The first and decisive point is that he was truly acknowledged as the only god, beside whom any other god was unthinkable. Akhenaten's monotheism was taken seriously by an entire people; indeed, that people clung so much to this idea that it became the main content of their intellectual life[1] and left them no interest for other things. On this the people and the priesthood who had become dominant among them were at one. But whereas the priests exhausted their efforts in erecting the ceremonial for his worship, they came in opposition to intense currents among the people which sought to revive two others of the doctrines of Moses about his god. The voices of the

1 ['*Geisteslebens*.' Cf. footnote 1, p. 60 below.]

Prophets never tired of declaring that God despised ceremonial and sacrifice and required only that people should believe in him and lead a life in truth and justice. And when they praised the simplicity and holiness of life in the wilderness they were certainly under the influence of the Mosaic ideals.

It is time to raise the question of whether there is any need whatever to call in the influence of Moses as a cause of the final form taken by the Jewish idea of God, or whether it would not be enough to assume a spontaneous development to higher intellectuality[1] during a cultural life
[65] extending over hundreds of years. There are two things to be said about this possible explanation which would put an end to all our puzzling conjectures. First, that it explains nothing. In the case of the Greeks – unquestionably a most highly gifted people – the same conditions did not lead to monotheism but to a disintegration of their polytheist religion and to the beginning of philosophical thought. In Egypt, so far as we can understand, monotheism grew up as a by-product of imperialism: God was a reflection of the Pharaoh who was the absolute ruler of a great world empire. With the Jews, political conditions were highly unfavourable for the development from the idea of an exclusive national god to that of a universal ruler of the world. And where did this tiny and powerless nation find the arrogance to declare itself the favourite child of the great Lord? The problem of the origin of monotheism among the Jews would thus remain unsolved, or we should have to be content with the common answer that it is the expression of the peculiar religious genius of that people. Genius is well known to be incomprehensible and irresponsible, and we ought therefore not to bring it up as an explanation till every other solution has failed us.[2]

In addition to this, we come upon the fact that Jewish records and historical writings themselves point us the way, by asserting most definitely – this time without contradicting themselves – that the idea of a single god was brought to the people by Moses. If there is an objection to the trustworthiness of this assurance, it is that the priestly revision of the text we have before us obviously traces far too much back to Moses. Institutions such as the ritual ordinances, which date unmistakably from later times, are given out as Mosaic commandments with the plain intention of lending them authority. This certainly gives us ground

1 ['*Geistigkeit*.' See the discussion of the rendering of this word in the footnote on p. 79 below.]

2 This same consideration applies, too, to the remarkable case of William Shakespeare of Stratford. [See a footnote to *An Outline of Psychoanalysis*, p. 173 *n.* 1 below.]

for suspicion, but not enough for a rejection. For the deeper motive for an exaggeration of this kind is obvious. The priestly narrative seeks to establish continuity between its contemporary period and the remote Mosaic past; it seeks to disavow precisely what we have described as the most striking fact about Jewish religious history, namely that there is a yawning gap between the lawgiving of Moses and the later Jewish religion – a gap which was at first filled by the worship of Yahweh, and [66]
was only slowly patched up afterwards. It disputes this course of events by every possible means, though its historical correctness is established beyond any doubt, since, in the particular treatment given to the biblical text, superabundant evidence has been left to prove it. Here the priestly revision has attempted something similar to the tendentious distortion which made the new god Yahweh into the god of the patriarchs [p. 42 above]. If we take this motive of the Priestly Code into account, we shall find it hard to withhold our belief from the assertion that Moses really did himself give the monotheist idea to the Jews. We should be all the readier to give our assent since we can say where Moses derived this idea from, which the Jewish priests certainly knew no longer.

And here someone might ask what we gain by tracing Jewish to Egyptian monotheism. It merely pushes the problem a little way further back: it tells us nothing more of the genesis of the monotheist idea. The answer is that the question is not one of gain but of investigation. Perhaps we may learn something from it if we discover the real course of events.

B. THE LATENCY PERIOD AND TRADITION

We confess the belief, therefore, that the idea of a single god, as well as the rejection of magically effective ceremonial and the stress upon ethical demands made in his name, were in fact Mosaic doctrines, to which no attention was paid to begin with, but which, after a long interval had elapsed, came into operation and eventually became permanently established. How are we to explain a delayed effect of this kind and where do we meet with a similar phenomenon?

It occurs to us at once that such things are not infrequently to be found in the most various spheres and that they probably come about in a number of ways which are understandable with greater or lesser ease. Let us take, for instance, the history of a new scientific theory, such as Darwin's theory of evolution. At first it met with embittered rejection and was violently disputed for decades; but it took no longer than a

generation for it to be recognized as a great step forward towards truth.
[67] Darwin himself achieved the honour of a grave or cenotaph in Westminster Abbey. A case such as that leaves us little to unravel. The new truth awoke emotional resistances; these found expression in arguments by which the evidence in favour of the unpopular theory could be disputed; the struggle of opinions took up a certain length of time; from the first there were adherents and opponents; the number as well as the weight of the former kept on increasing till at last they gained the upper hand; during the whole time of the struggle the subject with which it was concerned was never forgotten. We are scarcely surprised that the whole course of events took a considerable length of time; and we probably do not sufficiently appreciate that what we are concerned with is a
Masse process in group psychology [*Massenpsychologie*]T.

There is no difficulty in finding an analogy in the mental life [*Seelen-*
Seele *leben*]T of an individual corresponding precisely to this process. Such would be the case if a person learnt something new to him which, on the ground of certain evidence, he ought to recognize as true, but which contradicts some of his wishes and shocks a few convictions that are precious to him. Thereupon he will hesitate, seek reasons to enable him to throw doubts on this new thing, and for a while will struggle with himself, till finally he admits to himself: 'All the same it *is* so, though it's not easy for me to accept it, though it's distressing to me to have to believe it.' What we learn from this is merely that it takes time for the reasoning activity of the ego [*Ichs*]T to overcome the objections that are maintained by strong affective cathexes [*Besetzungen*]T. The similarity between this case and the one we are endeavouring to understand is not very great.

The next example we turn to appears to have even less in common with our problem. It may happen that a man who has experienced some frightful accident – a railway collision, for instance – leaves the scene of the event apparently uninjured. In the course of the next few weeks, however, he develops a number of severe psychical and motor symptoms which can only be traced to his shock, the concussion or whatever else it was. He now has a 'traumatic neurosis'. It is a quite unintelligible – that is to say, a new – fact. The time that has passed between the accident and the first appearance of the symptoms is described as the 'incubation period', in a clear allusion to the pathology of infectious diseases. On reflection [*Nachträglich*], it must strike us
[68] that, in spite of the fundamental difference between the two cases – the problem of traumatic neurosis and that of Jewish monotheism – there

is nevertheless one point of agreement: namely, in the characteristic that might be described as 'latency'. According to our assured hypothesis, in the history of the Jewish religion there was a long period after the defection from the religion of Moses during which no sign was to be detected of the monotheist idea, of the contempt for ceremonial or of the great emphasis on ethics. We are thus prepared for the possibility that the solution to our problem is to be looked for in a particular psychological situation.

We have already repeatedly described what happened at Kadesh when the two portions of what was later to be the Jewish people came together to receive a new religion. In those, on the one hand, who had been in Egypt, memories of the Exodus and of the figure [*Gestalt*] of Moses were still so strong and vivid that they demanded their inclusion in an account of early times. They were grandchildren, perhaps, of people who had known Moses himself, and some of them still felt themselves Egyptians and bore Egyptian names. But they had good motives for repressing the memory of the fate with which their leader and lawgiver had met. The determining purpose of the other portion of the people was to glorify the new god and to dispute his being foreign. Both portions had the same interest in disavowing the fact of their having had an earlier religion and the nature of its content. So it was that the first compromise came about, and it was probably soon recorded in writing. The people who had come from Egypt had brought writing and the desire to write history along with them; but it was to be a long time before historical writing realized that it was pledged to unswerving truthfulness. To begin with it had no scruples about shaping its narratives according to the needs and purposes of the moment, as though it had not yet recognized the concept of falsification. As a result of these circumstances a discrepancy was able to grow up between the written record and the oral transmission of the same material – *tradition*. What had been omitted or changed in the written record might very well have been preserved intact in tradition. Tradition was a supplement but at the same time a contradiction to historical writing. It was less subjected to the influence of distorting purposes and perhaps at some points quite [69]
exempt from them, and it might therefore be more truthful than the account that had been recorded in writing. Its trustworthiness, however, suffered from the fact that it was less stable and definite than the written account and exposed to numerous changes and alterations when it was handed on [*übertragen*] from one generation to another by

oral communication. A tradition of such a kind might meet with various sorts of fate. What we should most expect would be that it would be crushed by the written account, would be unable to stand up against it, would become more and more shadowy and would finally pass into oblivion. But it might meet with other fates: one of these would be that the tradition itself would end in a written record, and we shall have to deal with yet others as we proceed.

The phenomenon of latency in the history of the Jewish religion, with which we are dealing, may be explained, then, by the circumstance that the facts and ideas which were intentionally disavowed by what may be called the official historians were in fact never lost. Information about them persisted in traditions which survived among the people. As we are assured by Sellin, indeed, there was actually a tradition about the end of Moses which flatly contradicted the official account and was far nearer the truth. The same, we may assume, also applied to other things which apparently ceased to exist at the same time as Moses – to some of the contents of the Mosaic religion, which had been unacceptable to the majority of his contemporaries.

The remarkable fact with which we are here confronted is, however, that these traditions, instead of becoming weaker with time, became more and more powerful in the course of centuries, forced their way into the later revisions of the official accounts and finally showed themselves strong enough to have a decisive influence on the thoughts and actions of the people. The determinants which made this outcome possible are for the moment, it is true, outside our knowledge.

This fact is so remarkable that we feel justified in looking at it once again. Our problem is comprised in it. The Jewish people had abandoned the Aten religion brought to them by Moses and had turned to the worship of another god who differed little from the Baalim[1] of the
[70] neighbouring peoples. All the tendentious efforts of later times failed to disguise this shameful fact. But the Mosaic religion had not vanished without leaving a trace; some sort of memory of it had kept alive – a possibly obscured and distorted tradition. And it was this tradition of a great past which continued to operate (from the background, as it were), which gradually acquired more and more power over people's minds and which in the end succeeded in changing the god Yahweh into the Mosaic god and in reawakening into life the religion of Moses that had been introduced and then abandoned long centuries before. That a

1 [Local gods.]

tradition thus sunk in oblivion should exercise such a powerful effect on the mental life of a people is an unfamiliar idea to us. We find ourselves here in the field of group psychology, where we do not feel at home. We shall look about for analogies, for facts that are at least of a similar nature, even though in different fields. And facts of that sort are, I believe, to be found.

During the period at which, among the Jews, the return of the religion of Moses was in preparation, the Greek people found themselves in possession of an exceedingly rich store of tribal legends and hero myths. It is believed that the ninth or eighth century B.C. saw the origin of the two Homeric epics, which drew their material from this circle of legends. With our present psychological insight we could, long before Schliemann and Evans, have raised the question of where it was that the Greeks obtained all the legendary material which was worked over by Homer and the great Attic dramatists in their masterpieces. The answer would have had to be that this people had probably experienced in their prehistory a period of external brilliance and cultural efflorescence which had perished in a historical catastrophe and of which an obscure tradition survived in these legends. The archaeological researches of our days have now confirmed this suspicion, which in the past would certainly have been pronounced too daring. These researches have uncovered the evidences of the impressive Minoan–Mycenaean civilization, which had probably already come to an end on the mainland of Greece before 1250 B.C. There is scarcely a hint at it to be found in the Greek historians of a later age: at most a remark that there was a time when the Cretans exercised command of the sea, and the name of King Minos and of his palace, the Labyrinth. That is all, and beyond it nothing has remained but the traditions which were seized on by the poets. [71]

National epics of other peoples – Germans, Indians, Finns – have come to light as well. It is the business of historians of literature to investigate whether we may assume the same determinants for their origin as with the Greeks. Such an investigation would, I believe, yield a positive result. Here is the determinant which we recognize: a piece of prehistory which, immediately after it, would have been bound to appear rich in content, important, splendid, and always, perhaps, heroic, but which lies so far back, in such remote times, that only an obscure and incomplete tradition informs later generations of it. Surprise has been felt that the epic as an art form has become extinct in later times. The explanation may be that its determining cause no longer exists. The old material was used up and for all later events historical

writing took the place of tradition. The greatest heroic deeds of our days have not been able to inspire an epic, and even Alexander the Great had a right to complain that he would find no Homer.

Long-past ages have a great and often puzzling attraction for men's imagination. Whenever they are dissatisfied with their present surroundings – and this happens often enough – they turn back to the past and hope that they will now be able to prove the truth of the unextinguishable dream of a golden age.[1] They are probably still under the spell of their childhood, which is presented to them by their not impartial memory as a time of uninterrupted bliss.

If all that is left of the past are the incomplete and blurred memories which we call tradition, this offers an artist a peculiar attraction, for in that case he is free to fill in the gaps in memory according to the desires of his imagination [*Phantasie*] and to picture the period which he wishes to reproduce according to his intentions. One might almost say that the vaguer a tradition has become the more serviceable it becomes for a poet. We need not therefore be surprised at the importance of tradition for imaginative writing [*Dichtung*], and the analogy with the manner in which epics are determined will make us more inclined to
[72] accept the strange hypothesis that it was the tradition of Moses which, for the Jews, altered the worship of Yahweh in the direction of the old Mosaic religion. But in other respects the two cases are still too different. On the one hand, the outcome is a poem and, on the other, a religion; and in the latter instance we have assumed that, under the spur of tradition, it was reproduced with a faithfulness for which the instance of the epic can of course offer no counterpart. Accordingly enough of our problem is left over to justify a need for more apposite analogies.

C. THE ANALOGY

The only satisfying analogy to the remarkable course of events that we have found in the history of the Jewish religion lies in an apparently remote field; but it is very complete, and approaches identity. In it we once more come upon the phenomenon of latency, the emergence of unintelligible manifestations calling for an explanation and an early, and later forgotten, event as a necessary determinant. We also find the characteristic of compulsion [*Zwanges*], which forces itself on the mind

1 This was the situation on which Macaulay based his *Lays of Ancient Rome*. He put himself in the place of a minstrel who, depressed by the confused party strife of his own day, presented his hearers with the self-sacrifice, the unity and the patriotism of their ancestors.

along with an overpowering of logical thought – a feature which did not come into account, for instance, in the genesis of the epic.

This analogy is met with in psychopathology, in the genesis of human neuroses – in a field, that is to say, belonging to the psychology of individuals, while religious phenomena have of course to be reckoned as part of group psychology. We shall see that this analogy is not so surprising as might at first be thought – indeed that it is more like a postulate.

We give the name of *traumas* to those impressions, experienced early and later forgotten, to which we attach such great importance in the aetiology of the neuroses. We may leave on one side the question of whether the aetiology of the neuroses in general may be regarded as traumatic. The obvious objection to this is that it is not possible in every case to discover a manifest trauma in the neurotic subject's earliest history. We must often resign ourselves to saying that all we have before us is an unusual, abnormal reaction to experiences and demands which affect everyone, but are worked over and dealt with by other people in [73] another manner which may be called normal. When we have nothing else at our disposal for explaining a neurosis but hereditary and constitutional dispositions, we are naturally tempted to say that it was not acquired but developed.

But in this connection two points must be stressed. Firstly, the genesis of a neurosis invariably goes back to very early impressions in childhood.[1] Secondly, it is true that there are cases which are distinguished as being 'traumatic' because their effects go back unmistakably to one or more powerful impressions in these early times – impressions which have escaped being dealt with normally, so that one is inclined to judge that if they had not occurred the neurosis would not have come about either. It would be enough for our purposes if we were obliged to restrict the analogy we are in search of to these traumatic cases. But the gap between the two groups [of cases] appears not to be unbridgeable. It is quite possible to unite the two aetiological determinants under a single conception [*Auffassung*]; it is merely a question of how one defines 'traumatic'. If we may assume that the experience acquires its traumatic character only as a result of a quantitative factor – that is to say, that in every case it is an excess in demand that is responsible for an experience evoking unusual pathological reactions – then we can easily arrive at the

1 This therefore makes it nonsensical to say that one is practising psychoanalysis if one excludes from examination and consideration precisely these earliest periods – as happens in some quarters. [Cf. Freud's criticisms of Jung's views in his 'History of the Psychoanalytic Movement' (1914*d*), particularly in *RSE*, **14**, 55 f.]

expedient of saying that something acts as a trauma in the case of one constitution but in the case of another would have no such effect. In this way we reach the concept of a sliding 'complemental series' as it is called,[1] in which two factors converge in fulfilling an aetiological requirement. A less of one factor is balanced by a more of the other; as a rule both factors operate together and it is only at the two ends of the series that there can be any question of a simple motive being at work. After mentioning this, we can disregard the distinction between traumatic and non-traumatic aetiologies as irrelevant to the analogy we are in search of.

In spite of a risk of repetition, it will perhaps be as well to bring
[74] together here the facts which comprise the analogy that is significant for us. They are as follows. Our researches have shown that what we call the phenomena (symptoms) of a neurosis are the result of certain experiences and impressions which for that very reason we regard as aetiological traumas. We now have two tasks before us: to discover (1) the common characteristics of these experiences and (2) those of neurotic symptoms, and in doing so we need not avoid drawing a somewhat schematic picture.

(1) (*a*) All these traumas occur in early childhood up to about the fifth year. Impressions from the time at which a child is beginning to talk stand out as being of particular interest; the periods between the ages of two and four seem to be the most important; it cannot be determined with certainty how long after birth this period of receptivity begins. (*b*) The experiences in question are as a rule totally forgotten, they are not accessible to memory and fall within the period of infantile amnesia, which is usually broken into by a few separate mnemic residues, what are known as 'screen memories' [*Deckerinnerungen*][T].[2] (*c*) They relate
Sex to impressions of a sexual [*sexueller*][T] and aggressive nature, and no doubt also to early injuries to the ego (narcissistic mortifications). In this connection it should be remarked that such young children make no sharp distinction between sexual and aggressive acts, as they do later. (Cf. the misunderstanding of the sexual act in a sadistic sense.[3]) The predominance of the sexual factor is, of course, most striking and calls for theoretical consideration.

These three points – the very early appearance of these experiences

1 [See *Introductory Lectures*, XXII (1916–17*a*), *RSE*, **16**, 306.]

2 [See *Introductory Lectures*, XIII (1916–17*a*), ibid., **15**, 174.]

3 ['The Sexual Theories of Children' (1908*c*), ibid., **9**, 191–3.]

(during the first five years of life), the fact of their being forgotten and their sexual-aggressive content – are closely interconnected. The traumas are either experiences on the subject's own body or sense perceptions, mostly of something seen and heard – that is, experiences or impressions. The interconnection of these three points is established by a theory, a product of the work of analysis which alone can bring about a knowledge of the forgotten experiences, or, to put it more vividly but also more incorrectly, bring them back to memory. The theory is that, in contrast to popular opinion, the sexual life [*Geschlechtsleben*] of human beings (or what corresponds to it later on) exhibits an early efflorescence which comes to an end at about the fifth year and is [75]
followed by what is known as the period of latency (till puberty) in which there is no further development of sexuality [*Sexualität*] and indeed what has been attained undergoes a retrogression. This theory is confirmed by the anatomical investigation of the growth of the internal genitalia; it leads us to suppose that the human race is descended from a species of animal which reached sexual maturity [*geschlechtsreif*] in five years and rouses a suspicion that the postponement of sexual life [*Sexuallebens*] and its diphasic onset [in two waves] are intimately connected with the history of hominization.[1] Human beings appear to be the only animal organisms with a latency period and sexual retardation [*Sexualverspätung*] of this kind. Investigations on the primates (which, so far as I know, are not available) would be indispensable for testing this theory. It cannot be a matter of indifference psychologically that the period of infantile amnesia coincides with this early period of sexuality [*Sexualität*]. It may be that this state of things provides the true determinant for the possibility of neurosis, which is in a sense a human prerogative and from this point of view appears as a vestige – a 'survival'[2] – of primaeval times like certain portions of our bodily anatomy.

(2) Two points must be stressed in regard to the common characteristics or peculiarities of neurotic phenomena: (*a*) The effects of traumas are of two kinds, positive and negative. The former are attempts to bring the trauma into operation once again – that is, to remember the forgotten experience or, better still, to make it real, to experience a repetition of it anew, or, even if it was only an early emotional relationship, to revive it in an analogous relationship with someone else. We summarize

1 ['*Menschwerdung*', 'the process of becoming human'.]

2 [In English in the original.]

these efforts under the name of 'fixations' to the trauma and as a 'compulsion to repeat'. They may be taken up into what passes as a normal ego and, as permanent trends in it, may lend it unalterable character traits, although, or rather precisely because, their true basis and historical origin are forgotten. Thus a man who has spent his childhood in an excessive and today forgotten attachment to his mother may spend his whole life looking for a wife on whom he can make himself dependent and by whom he can arrange to be nourished and supported. A girl who
[76] was made the object of a sexual seduction in her early childhood may direct her later sexual life so as constantly to provoke similar attacks. It may easily be guessed that from such discoveries about the problem of neurosis we can penetrate to an understanding of the formation of character in general.

The negative reactions follow the opposite aim: that nothing of the forgotten traumas shall be remembered and nothing repeated. We can
Abwehr summarize them as 'defensive reactions' [*Abwehrreaktionen*][T]. Their principal expression are what are called 'avoidances', which may be intensified into 'inhibitions' [*Hemmungen*][T] and 'phobias'. These negative reactions too make the most powerful contributions to the stamping of character. Fundamentally they are just as much fixations to the trauma as their opposites, except that they are fixations with a contrary purpose. The symptoms of neurosis in the narrower sense are compromises in which both the trends proceeding from traumas come together, so that the share, now of one and now of the other tendency, finds preponderant expression in them. This opposition between the reactions sets up conflicts which in the ordinary course of events can reach no conclusion.

(*b*) All these phenomena, the symptoms as well as the restrictions on the ego and the stable character changes, have a *compulsive* quality: that is to say that they have great psychical intensity and at the same time exhibit a far-reaching independence of the organization of the other mental processes, which are adjusted to the demands of the real external world and obey the laws of logical thinking. They [the pathological phenomena] are insufficiently or not at all influenced by external reality, pay no attention to it or to its psychical representatives, so that they may easily come into active opposition to both of them. They are, one might say, a State within a State, an inaccessible party, with which cooperation is impossible, but which may succeed in overcoming what is known as the normal party and forcing it into its service. If this happens, it implies a domination by an internal psychical reality over the reality of the

external world and the path to a psychosis lies open.[1] Even if things do not go so far, the practical importance of this situation can scarcely be [77]
overestimated. The inhibition upon the life of those who are dominated by a neurosis and their incapacity for living constitute a most important factor in a human society and we may recognize in their condition a direct expression of their fixation to an early portion of their past.

And now let us enquire about latency, which, in view of the analogy, is bound to interest us especially. A trauma in childhood may be followed immediately by a neurotic outbreak, an infantile neurosis, with an abundance of efforts at defence, and accompanied by the formation of symptoms. This neurosis may last a considerable time and cause marked disturbances, but it may also run a latent course and be overlooked. As a rule defence retains the upper hand in it; in any case alterations of the ego,[2] comparable to scars, are left behind. It is only rarely that an infantile neurosis continues without interruption into an adult one. Far more often it is succeeded by a period of apparently undisturbed development – a course of things which is supported or made possible by the intervention of the physiological period of latency. Not until later does the change take place with which the definitive neurosis becomes manifest as a belated effect [*verspätete Wirkung*] of the trauma. This occurs either at the irruption of puberty or some while later. In the former case it happens because the drives [*Triebe*][T], intensified by physical maturation, are able now to take up the struggle again in which they were at first defeated by the defence. In the latter case it happens because the reactions and alterations of the ego brought about by the defence now prove a hindrance in dealing with the new tasks of life, so that severe conflicts come about between the demands of the real external world and the ego, which seeks to maintain the organization which it has painstakingly achieved in its defensive struggle. The phenomenon of a latency of the neurosis between the first reactions to the trauma and the later outbreak of the illness must be regarded as typical. This latter illness may also be looked upon as an attempt at cure – as an effort once more to reconcile with the rest those portions of the ego that have been split off [*abgespaltenen*] by the influence of the trauma and to unite them into a powerful whole *vis-à-vis* the external world. An attempt of [78]

1 [The distinction between psychical and external reality was already made in Section 2 of Part III of the 'Project' of 1895 (1950*a*; *RSE*, **1**, 397), where a discussion of Freud's use of the terms can be found in an Editors' footnote. – Cf. also p. 118 *n*. below.]

2 [See a discussion in the Editors' Note to 'Analysis Terminable and Interminable' (1937*c*), p. 192 below, and Section V of that paper.]

this kind seldom succeeds, however, unless the work of analysis comes to its help, and even then not always; it ends often enough in a complete devastation or fragmentation of the ego or in its being overwhelmed[1] by the portion which was early split off and which is dominated by the trauma.

In order to convince the reader, it would be necessary to give detailed reports of the life histories of numerous neurotics. But in view of the diffuseness and difficulty of the topic, this would completely destroy the character of the present work. It would turn into a monograph on the theory of the neuroses and even so would probably only have an effect on that minority of readers who have chosen the study and practice of psychoanalysis as their life-work. Since I am addressing myself here to a wider audience, I can only beg the reader to grant a certain provisional credence to the abridged account I have given above; and this must be accompanied by an admission on my part that the implications to which I am now leading him need only be accepted if the theories on which they are based turn out to be correct.

Nevertheless, I can attempt to tell the story of a single case which exhibits with special clarity some of the characteristics of a neurosis which I have mentioned. We must not expect, of course, that a single case will show everything and we need not feel disappointed if its subject matter is far removed from the topic for which we are seeking an analogy.

A little boy, who, as is so often the case in lower-class families, shared his parents' bedroom during the first years of his life, had repeated, and indeed regular, opportunities of observing sexual acts between his parents – of seeing some things and hearing still more – at an age when he had scarcely learnt to speak. In his later neurosis, which broke out immediately after his first spontaneous emission, the earliest and most troublesome symptom was a disturbance of sleep. He was extraordinarily sensitive to noises at night and, once he was woken up, was unable to go to sleep again. This disturbance of sleep was a true compromise
[79] symptom. On the one hand, it was an expression of his defence against the things he had experienced at night, and on the other an attempt to re-establish the waking state in which he was able to listen to those impressions.

The child was aroused prematurely by observations of this kind to an

1 [Cf. an Editors' footnote to Draft K (1950*a*), *RSE*, **1**, 250 *n.* 2, and another to *The Ego and the Id* (1923*b*), ibid., **19**, 51 *n.* 3.]

aggressive masculinity and began to excite his little penis with his hand and to attempt various sexual attacks on his mother, thus identifying himself with his father, in whose place he was putting himself. This went on until at last his mother forbade him to touch his penis and further threatened that she would tell his father, who would punish him by taking his sinful organ away. This threat of castration had an extraordinarily powerful traumatic effect on the boy. He gave up his sexual activity and altered his character. Instead of identifying himself with his father, he was afraid of him, adopted a passive attitude to him and, by occasional naughtinesses, provoked him into administering corporal punishment; this had a sexual meaning for him, so that he was thus able to identify himself with his ill-treated mother. He clung to his mother herself more and more anxiously [*ängstlicher*][T], as though he could not *Angst*
do without her love for a single moment, since he saw in it a protection against the danger of castration which threatened him from his father. In this modification of the Oedipus complex he passed his latency period, which was free from any marked disturbances. He became an exemplary boy and was quite successful at school.

So far we have followed the immediate effect of the trauma and have confirmed the fact of latency.

The arrival of puberty brought with it the manifest neurosis and disclosed its second main symptom – sexual impotence. He had forfeited the sensitivity of his penis, did not attempt to touch it, did not venture to approach a woman for sexual purposes. His sexual activity remained limited to psychical masturbation accompanied by sadistic-masochistic phantasies in which it was not hard to recognize offshoots of his early observations of intercourse between his parents. The wave of intensified masculinity which puberty brought along with it was employed in furious hatred of his father and insubordination to him. This extreme relation to his father, reckless to the pitch of self-destruction, was responsible as well for his failure in life and his conflicts with the external world. He must be a failure in his profession because his father had forced him into it. Nor did he make any friends and he was never on [80]
good terms with his superiors.

When, burdened by these symptoms and incapacities, he at last, after his father's death, had found a wife, there emerged in him, as though they were the core of his being, character traits which made contact with him a hard task for those about him. He developed a completely egoistic, despotic and brutal personality, which clearly felt a need to suppress and insult other people. It was a faithful copy of his father as

he had formed a picture of him in his memory: that is to say, a revival of the identification with his father which in the past he had taken on as a little boy from sexual motives. In this part of the story we recognize the *return* of the repressed, which (along with the immediate effects of the trauma and the phenomenon of latency) we have described as among the essential features of a neurosis.

D. APPLICATION

Early trauma – defence – latency – outbreak of neurotic illness – partial return of the repressed. Such is the formula which we have laid down for the development of a neurosis. The reader is now invited to take the step of supposing that something occurred in the life of the human species similar to what occurs in the life of individuals: of supposing, that is, that here too events occurred of a sexually aggressive nature, which left behind them permanent consequences but were for the most part fended off and forgotten, and which after a long latency came into effect and created phenomena similar to symptoms in their structure [*Aufbau*][T] and purpose.

We believe that we can guess these events and we propose to show that their symptom-like consequences are the phenomena of religion. Since the emergence of the idea of evolution no longer leaves room for doubt that the human race has a prehistory, and since this is unknown – that is, forgotten – a conclusion of this kind almost carries the weight of a postulate. When we learn that in both cases the operative and forgotten traumas relate to life in the human family, we can greet this
[81] as a highly welcome, unforeseen bonus which has not been called for by our discussions up to this point.

I put forward these assertions as much as a quarter of a century ago in my *Totem and Taboo* (1912–13*a*) and I need only repeat them here. My construction starts out from a statement of Darwin's [1871, **2**, 362 f.] and takes in a hypothesis of Atkinson's [1903, 220 f.]. It asserts that in primaeval times primitive man lived in small hordes,[1] each under the domination of a powerful male. No date can be assigned to this, nor has it been synchronized with the geological epochs known to us: it is probable that these human creatures had not advanced far in the development of speech. An essential part of the construction is the hypothesis that the events I am about to describe occurred to all primitive men – that

1 ['*Horden.*' Freud always uses this term in the sense of a small and more or less organized group. See *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 117 *n.*]

is, to all our ancestors. The story is told in an enormously condensed form [*in grossartiger Verdichtung*][T], as though it had happened on a single occasion, while in fact it covered thousands of years and was repeated countless times during that long period. The strong male was lord and father of the entire horde and unrestricted in his power, which he exercised with violence. All the females were his property – wives and daughters of his own horde and some, perhaps, robbed from other hordes. The lot of his sons was a hard one: if they roused their father's jealousy they were killed or castrated or driven out. Their only resource was to collect together in small communities, to get themselves wives by robbery, and, when one or other of them could succeed in it, to raise themselves into a position similar to their father's in the primal horde. For natural reasons, youngest sons occupied an exceptional position. They were protected by their mother's love, and were able to take advantage of their father's increasing age and succeed him on his death. We seem to detect echoes in legends and fairy tales both of the expulsion of elder sons and of the favouring of youngest sons.

The first decisive step towards a change in this sort of 'social' organization seems to have been that the expelled brothers, living in a community, united to overpower their father and, as was the custom in those days, devoured him raw. There is no need to balk at this cannibalism; it continued far into later times. The essential point, however, is that we attribute the same emotional attitudes to these primitive men [82] that we are able to establish by analytic investigation in the primitives of the present day – in our children. We suppose, that is, that they not only hated and feared their father but also honoured him as a model, and that each of them wished to take his place in reality. We can, if so, understand the cannibalistic act as an attempt to ensure identification with him by incorporating a piece of him.

It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a *renunciation of drive*,[1] a recognition of mutual *obligations*, the introduction of definite *institutions*, pronounced inviolable (holy) – that

1 [This is the subject of Section D of Part II, p. 105 ff. below.]

is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the *taboo on incest* and the injunction to *exogamy* came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of *matriarchy*. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal – at first, perhaps, always one that was feared as well – was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand, the totem was regarded as the clan's blood ancestor and protective spirit [*Schutzgeist*], who must be worshipped and protected, and, on the other hand, a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured
[83] by all the tribesmen in common. (The totem meal, according to Robertson Smith [1894].) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.

What is the place of religion in this connection? I think we are completely justified in regarding totemism, with its worship of a father substitute, with its ambivalence as shown by the totem meal, with its institution of memorial festivals and of prohibitions whose infringement was punished by death – we are justified, I say, in regarding totemism as the first form in which religion was manifested in human history and in confirming the fact of its having been linked from the first with social regulations and moral obligations. Here we can give only the most summary survey of the further developments of religion.
Kultur They no doubt proceeded in parallel with the cultural [*kulturellen*][T] advances of the human race and with the changes in the structure of human communities.

The first step away from totemism was the humanizing of the being who was worshipped. In place of the animals, human gods appear, whose derivation from the totem is not concealed. The god is still represented either in the form of an animal or at least with an animal's face, or the totem becomes the god's favourite companion, inseparable from him, or legend tells us that the god slew this precise animal, which was

after all only a preliminary stage of himself. At a point in this evolution which is not easily determined great mother goddesses appeared, probably even before the male gods, and afterwards persisted for a long time beside them. In the meantime a great social revolution had occurred. Matriarchy was succeeded by the re-establishment of a patriarchal order. The new fathers, it is true, never achieved the omnipotence of the primal father; there were many of them, who lived together in associations larger than the horde had been. They were obliged to be on good terms with one another, and remained under the limitation of social ordinances. It is likely that the mother goddesses originated at the time of the curtailment of the matriarchy, as a compensation for the slight upon the mothers. The male deities appear first as sons beside the great mothers and only later clearly assume the features of father figures. These male gods of polytheism reflect the conditions during the patriarchal age. They are numerous, mutually restrictive, and are occasionally subordinated to a superior high god. The next step, how- [84]
ever, leads us to the theme with which we are here concerned – to the return of a single father god of unlimited dominion.[1]

It must be admitted that this historical survey has gaps in it and is uncertain at some points. But anyone who is inclined to pronounce our construction of primaeval history purely imaginary would be gravely underestimating the wealth and evidential value of the material contained in it. Large portions of the past, which have been linked together here into a whole, are historically attested: totemism and the male confederacies, for instance. Other portions have survived in excellent replicas. Thus authorities have often been struck by the faithful way in which the sense and content of the old totem meal is repeated in the rite of the Christian Communion, in which the believer incorporates the blood and flesh of his god in symbolic form. Numerous relics of the forgotten primaeval age have survived in popular legends and fairy tales, and the analytic study of the mental life of children has provided an unexpected wealth of material for filling the gaps in our knowledge of the earliest times. As contributions to our understanding of the son's relation to the father which is of such great importance, I need only bring forward animal phobias, the fear, which strikes us as so strange, of being eaten by the father, and the enormous intensity of the dread of

1 [The bulk of the material in this account can be found discussed at much greater length in the fourth essay of *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 96 ff., though there is rather more discussion here than anywhere else of the mother goddesses. (On this last point, cf. the footnote on p. 43 above. See also some remarks in Chapter XII of *Group Psychology* (1921*c*), *RSE*, **18**, 126 and 127.) The general subject is taken up again in Section D of Part II, p. 108 ff. below.]

being castrated. There is nothing wholly fabricated in our construction, nothing which could not be supported on solid foundations.

If our account of primaeval history is accepted as on the whole worthy of belief, two sorts of elements will be recognized in religious doctrines and rituals: on the one hand, fixations to the ancient history of the family and survivals of it, and, on the other hand, revivals of the past and returns, after long intervals, of what has been forgotten. It is this last portion which, hitherto overlooked and therefore not understood, is to be demonstrated here in at least one impressive instance.

[85] It is worth specially stressing the fact that each portion which returns from oblivion asserts itself with peculiar force, exercises an incomparably powerful influence on people in the mass [*Menschenmassen*], and raises an irresistible claim to truth against which logical objections remain powerless: a kind of '*credo quia absurdum*'.[1] This remarkable feature can only be understood on the pattern of the delusions of psychotics. We have long understood that a portion of forgotten truth lies hidden in delusional ideas, that when this returns it has to put up with distortions and misunderstandings, and that the compulsive conviction which attaches to the delusion arises from this core of truth and spreads out on to the errors that wrap it round. We must grant an ingredient such as this of what may be called *historical* truth to the dogmas of religion as well, which, it is true, bear the character of psychotic symptoms but which, as group phenomena [*Massenphänomene*], escape the curse of isolation.[2]

No other portion of the history of religion has become so clear to us as the introduction of monotheism into Judaism and its continuation in Christianity – if we leave on one side the development which we can trace no less uninterruptedly, from the animal totem to the human god with his regular companions. (Each of the four Christian evangelists still has his own favourite animal.) If we provisionally accept the world empire of the Pharaohs as the determining cause of the emergence of the monotheist idea, we see that that idea, released from its native soil and transferred [*übertragen*] to another people was, after a long period of latency, taken hold of by them, preserved by them as a precious possession and, in turn, itself kept them alive by giving them pride in being a chosen people: it was the religion of their primal father to which were

1 ['I believe because it is absurd.' Attributed to Tertullian. This had been discussed by Freud in *The Future of an Illusion* (1927*c*), *RSE*, **21**, 26–7.]

2 [See p. 116 ff. below.]

attached their hope of reward, of distinction and finally of world dominion. This last wishful phantasy, long abandoned by the Jewish people, still survives among that people's enemies in a belief in a conspiracy by the 'Elders of Zion'. We reserve for discussion in later pages how the special peculiarities of the monotheist religion borrowed from Egypt affected the Jewish people and how it was bound to leave a permanent imprint on their character through its rejection of magic and mysticism, [86]
its invitation to advances in intellectuality[1] and its encouragement of sublimations; how the people, enraptured by the possession of the truth, overwhelmed by the consciousness of being chosen, came to have a high opinion of what is intellectual and to lay stress on what is moral; and how their melancholy destinies and their disappointments in reality served only to intensify all these trends. For the moment we will follow their development in another direction.

The re-establishment of the primal father in his historical rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world [*Kulturwelt*] of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new – the Christian – religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (*evangelium*). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems

1 ['The Advance in Intellectuality' is the title of Section C of Part II of this essay (p. 101 below). The German word here translated 'intellectuality' is '*Geistigkeit*' and its rendering raises much difficulty. The obvious alternative would be 'spirituality', but in English this arouses some very different associations. The best plan, perhaps, is to examine Freud's own account of the concept in the section just referred to and to form one's conclusions on that.]

to have been Paul's own contribution. In the most proper sense he was
[87] a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.

That the redeemer had sacrificed himself without guilt was evidently a tendentious distortion, which offered difficulties to logical understanding. For how could someone guiltless of the act of murder take on himself the guilt of the murderers by allowing himself to be killed? In the historical reality there was no such contradiction. The 'redeemer' could be none other than the most guilty person, the ringleader of the company of brothers who had overpowered their father. We must in my judgement leave it undecided whether there was such a chief rebel and ringleader. That is possible; but we must also bear in mind that each one of the company of brothers certainly had a wish to commit the deed by himself alone and so to create an exceptional position for himself and to find a substitute for his identification with the father which was having to be given up and which was becoming merged in the community. If there was no such ringleader, then Christ was the heir to a wishful phantasy which remained unfulfilled; if there was one, then he was his successor and his reincarnation. But no matter whether what we have here is a phantasy or the return of a forgotten reality, in any case the origin of the concept of a hero is to be found at this point – the hero who always rebels against his father and kills him in some shape or other.[1] Here too is the true basis for the 'tragic guilt' of the hero of drama, which is otherwise hard to explain. It can scarcely be doubted that the hero and chorus in Greek drama represent the same rebellious hero and company of brothers; and it is not without significance that in the Middle Ages what the theatre started with afresh was the representation of the story of the Passion.

We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal – no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty.
[88] Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took His place, just as every son

1 Ernest Jones has pointed out that the god Mithras, who kills the bull, might represent this ringleader boasting of his deed. It is well known for how long the worship of Mithras struggled with the young Christianity for the final victory.

had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed His success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark – circumcision – so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion – it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

In some respects the new religion meant a cultural regression as compared with the older, Jewish one, as regularly happens when a new mass of people, of a lower level, break their way in or are given admission. The Christian religion did not maintain the high level in things of the mind [*Vergeistigung*] to which Judaism had soared. It was no longer strictly monotheist, it took over numerous symbolic rituals from surrounding peoples, it re-established the great mother goddess and found room to introduce many of the divine figures of polytheism only lightly veiled, though in subordinate positions. Above all, it did not, like the Aten religion and the Mosaic one which followed it, exclude the entry of superstitious, magical and mystical elements, which were to prove a severe inhibition upon the intellectual [*geistige*] development of the next two thousand years.

The triumph of Christianity was a fresh victory for the priests of Amun over Akhenaten's god after an interval of fifteen hundred years and on a wider stage. And yet in the history of religion – that is, as regards the return of the repressed – Christianity was an advance and from that time on the Jewish religion was to some extent a fossil.

It would be worthwhile to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. Fate had brought the great deed and [89]
misdeed of primaeval days, the killing of the father, closer to the Jewish people by causing them to repeat it on the person of Moses, an outstanding father figure. It was a case of 'acting out' ['*Agieren*'][T] instead of remembering, as happens so often with neurotics during the work of analysis.[1] To the suggestion that they should remember, which was made

1 [See Freud's technical paper 'Remembering, Repeating and Working Through' (1914g), *RSE*, **12**, 147–51.]

to them by the doctrine of Moses, they reacted, however, by disavowing their action; they remained halted at the recognition of the great father and thus blocked their access to the point from which Paul was later to start his continuation of the primal history. It is scarcely a matter of indifference or of chance that the violent killing of another great man became the starting point of Paul's new religious creation as well. This was a man whom a small number of adherents in Judaea regarded as the Son of God and as the Messiah who had been announced, and to whom, too, a part of the childhood story invented for Moses was later carried over [p. 15 above], but of whom in fact we know scarcely more with certainty than of Moses – whether he was really the great teacher portrayed by the Gospels or whether, rather, it was not the fact and circumstances of his death which were decisive for the importance which his figure [*Person*]^{T} acquired. Paul, who became his apostle, had not known him himself.

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence^{1}), thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.[2] It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with
[90] some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for He was the resurrected Moses and behind Him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.[3]

The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You

1 'Israel in der Wüste' ['Israel in the Wilderness']. In the Weimar Edition, **7**, 170.

2 On this subject see Frazer's well-known discussions in Part III of *The Golden Bough* (*The Dying God*). [Frazer, 1911*c*.]

3 [In *GW*, **16**, 196, the words 'the resurrected Moses and behind him' are omitted from this sentence.]

will not *admit* that you murdered God (the primal picture of God, the primal father, and his later reincarnations).' There should be an addition declaring: 'We did the same thing, to be sure, but we have *admitted* it and since then we have been absolved.' Not all the reproaches with which anti-Semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons [*Motive*]. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-Semitism today the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans.[1] Other grounds for hating the Jews are stronger – thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups [*Massen*] requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. [91]
First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs to the Mediterranean civilization. But they are nonetheless different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones.[2] The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity.

1 [It may be recalled that in his *Autobiographical Study* (1925*d*) Freud mentions a tradition that his father's family were settled for a long time at Cologne (*RSE*, **20**, 6).]

2 [Cf. 'the narcissism of minor differences', in Chapter V of *Civilization and its Discontents* (1930*a*), ibid., **21**, 102, where anti-Semitism is also discussed.]

The deeper motives for hatred of the Jews are rooted in the remotest past ages; they operate from the unconscious of the peoples, and I am prepared to find that at first they will not seem credible. I venture to assert that jealousy of the people which declared itself the first-born, favourite child of God the Father, has not yet been surmounted among other peoples even today: it is as though they had thought there was truth in the claim. Further, among the customs by which the Jews made themselves separate, that of circumcision has made a disagreeable, uncanny [*unheimlichen*] impression, which is to be explained, no doubt, by its recalling the dreaded castration and along with it a portion of the primaeval past which is gladly forgotten. And finally, as the latest motive in this series, we must not forget that all those peoples who excel today in their hatred of Jews became Christians only in late historical times, often driven to it by bloody coercion. It might be said that they are all 'mis-baptized'. They remain, under a thin veneer of Christianity, what their ancestors were, who worshipped a barbarous polytheism. They have not got over a grudge against the new religion which was imposed on them; but they have displaced [*verschoben*][T] the grudge on to the source from which Christianity reached them. The fact that the Gospels tell a story which is set among Jews, and in fact deals only with Jews, has made this displacement easy for them. Their hatred of Jews is at bottom a hatred of Christians, and we need not be surprised that in the German National Socialist revolution this intimate relation between the two monotheist religions finds such a clear expression in the hostile treatment of both of them.[1]

[92]

E. DIFFICULTIES

Perhaps by what I have said I have succeeded in establishing the analogy between neurotic processes and religious events and in thus indicating the unsuspected origin of the latter. In this transference [*Übertragung*] from individual to group psychology two difficulties arise, differing in their nature and importance, to which we must now turn.

The first of these is that we have here dealt with only a single instance from the copious phenomenology of religions and have thrown no light

1 [Freud seems to have first mentioned the unconscious root of anti-Semitism in the castration complex and circumcision in a footnote to his 'Little Hans' case history (1909*b*), *RSE*, **10**, 28 *n*. 2. He repeated the point in a footnote added in 1919 to his study of Leonardo (1910*c*), ibid., **11**, 88 *n*. 2. A reference to anti-Semitism in *Civilization and its Discontents* has been mentioned above (p. 83 *n*. 2) in an Editors' footnote. The present discussion is, however, much more elaborate than any of these. The subject was once again the topic of Freud's short contribution to a Paris periodical (1938*a*), which appears below (p. 257 f.).]

on any others. I must regretfully admit that I am unable to give more than this one example and that my expert knowledge is insufficient to complete the enquiry. From my limited information I may perhaps add that the case of the founding of the Mahommedan religion seems to me like an abbreviated repetition of the Jewish one, of which it emerged as an imitation. It appears, indeed, that the Prophet intended originally to accept Judaism completely for himself and his people. The recapture of the single great primal father brought the Arabs an extraordinary exaltation of their self-confidence, which led to great worldly successes but exhausted itself in them. Allah showed himself far more grateful to his chosen people than Yahweh did to his. But the internal development of the new religion soon came to a stop, perhaps because it lacked the [93] depth which had been caused in the Jewish case by the murder of the founder of their religion. The apparently rationalistic religions of the East are in their core ancestor worship and so come to a halt, too, at an early stage of the reconstruction of the past. If it is true that in primitive peoples of today the recognition of a supreme being is the only content of their religion, we can only regard this as an atrophy of religious development and bring it into relation with the countless cases of rudimentary neuroses which are to be observed in the other field. Why it is that in the one case just as in the other things have gone no further, our knowledge is in both cases insufficient to tell us. We can only attribute the responsibility to the individual endowment of these peoples, the direction taken by their activity and their general social condition. Moreover, it is a good rule in the work of analysis to be content to explain what is actually before one and not to seek to explain what has *not* happened.

The second difficulty about this transference to group psychology is far more important, because it poses a fresh problem of a fundamental nature. It raises the question in what form the operative tradition in the life of peoples is present – a question which does not occur with individuals, since there it is solved by the existence in the unconscious of memory traces of the past. Let us return to our historical example. We have attributed the compromise at Kadesh to the survival of a powerful tradition among those who had returned from Egypt. This case involves no problem. According to our theory, a tradition of this kind was based on conscious memories of oral communications which people then living had received from their ancestors only two or three generations back who had themselves been participants and eyewitnesses to the events in question. But can we believe the same thing

of the later centuries – that the tradition still had its basis in a knowledge normally handed on from grandfather to grandchild? It is no longer possible to say, as it was in the earlier case, who the people were who preserved this knowledge and handed it on by word of mouth. According to Sellin the tradition of the murder of Moses was always in the possession of priestly circles till eventually it found expression in writing which alone enabled Sellin to discover it. But it can have been known
[94] to only a few people; it was not public property. And is that enough to explain its effect? Is it possible to attribute to knowledge held like this by a few people the power to produce such a lasting emotion in the masses [*Massen*] when it came to their notice? It seems, rather, as though there must have been something present in the ignorant masses, too, which was in some way akin to the knowledge of the few and went halfway to meet it when it was uttered.

A decision is made still more difficult when we turn to the analogous case in primaeval times. It is quite certain that in the course of thousands of years the fact was forgotten that there had been a primal father with the characteristics we know and what his fate had been; nor can we suppose that there was any oral tradition of it, as we can in the case of Moses. In what sense, then, does a tradition come in question at all? In what form can it have been present?

In order to make it easier for readers who do not desire or are not prepared to plunge into a complicated psychological state of affairs, I will anticipate the outcome of the investigation that is to follow. In my opinion there is an almost complete conformity in this respect between the individual and the group [*Masse*]: in the group too an impression of the past is retained in unconscious memory traces.

In the case of the individual we believe we can see clearly. The memory trace of his early experience has been preserved in him, but in a special psychological condition. The individual may be said to have known it always, just as one knows about the repressed. Here we have formed ideas, which can be confirmed without difficulty through analysis, of how something can be forgotten and how it can then reappear after a while. What is forgotten is not extinguished but only 'repressed'; its memory traces are present in all their freshness, but isolated by 'anticathexes'. They cannot enter into communication with other intellectual [*intellektuellen*] processes; they are unconscious – inaccessible to consciousness. It may also be that certain portions of the repressed, having evaded the process [of repression], remain accessible

to memory and occasionally emerge into consciousness; but even so they are isolated, like foreign bodies out of connection with the rest. It may be so, but it need not be so; repression may also be complete, and it is with that alternative that we shall deal in what follows.

The repressed retains its upward urge [*Auftrieb*], its effort to force its [95]
way to consciousness. It achieves its aim under three conditions: (1) if the strength of the anticathexis is diminished by pathological processes which overtake the other part [of the mind], what we call the ego, or by a different distribution of the cathectic energies in that ego, as happens regularly in the state of sleep; (2) if the drive elements attaching to the repressed receive a special reinforcement (of which the best example is the processes during puberty); and (3) if at any time in recent experience impressions or experiences occur which resemble the repressed so closely that they are able to awaken it. In the last case the recent experience is reinforced by the latent energy of the repressed, and the repressed comes into operation behind the recent experience and with its help. In none of these three alternatives does what has hitherto been repressed enter consciousness smoothly and unaltered; it must always put up with distortions which testify to the influence of the resistance (not entirely overcome) arising from the anticathexis, or to the modifying influence of the recent experience or to both.

The difference between whether a psychical process is conscious or unconscious has served us as a criterion and a means of finding our bearings. The repressed is unconscious. Now it would simplify things agreeably if this sentence admitted of reversal – if, that is, the difference between the qualities of conscious (*Cs.*) and unconscious (*Ucs.*)[1] coincided with the distinction between 'belonging to the ego' and 'repressed'. The fact of there being isolated and unconscious things like this in our mental life would be sufficiently novel and important. But in reality the position is more complicated. It is true that everything repressed is unconscious, but it is not true that everything belonging to [96]
the ego is conscious. We notice that consciousness is a transient quality which attaches to a psychical process only in passing. For our purposes

1 [It may be remarked that these abbreviations make their final appearance here after a long interval. Apart from a couple of occurrences in Lecture XXXI of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 64, they had fallen entirely out of use since the structural account of the mind was established some fifteen years earlier in *The Ego and the Id* (1923*b*), where a full discussion of them is given in the Editors' Introduction, ibid., **19**, 5 ff. It is a curious fact that in the present work they are used, quite contrary to Freud's normal practice, in a 'descriptive' sense. These abbreviations are, in fact, also used in the manuscript of the *Outline of Psychoanalysis* (1940*a*). Abbreviations of all kinds are, however, especially frequent in that manuscript and the work, of course, was not seen by Freud in print.]

therefore we must replace 'conscious' with 'capable of being conscious' and we call this quality 'preconscious' (*Pcs*.). We then say, more correctly, that the ego is mainly preconscious (virtually conscious) but that portions of the ego are unconscious.

The establishment of this latter fact shows us that the qualities on which we have hitherto relied are insufficient to give us our bearings in the obscurity of mental life. We must introduce another distinction which is no longer qualitative but *topographical* and – what gives it special value – at the same time *genetic* [*genetisch*][T]. We now distinguish in our mental life (which we regard as an apparatus compounded of several agencies, districts or provinces) one region which we call the *ego* proper and another which we name the *id* [*Es*][T]. The id is the older of the two; the ego has developed out of it, like a cortical layer, through the influence of the external world. It is in the id that all our primary drives are at work, all the processes in the id take place unconsciously. The ego, as we have already said, coincides with the region of the preconscious; it includes portions which normally remain unconscious. The course of events in the id, and their mutual interaction, are governed by quite other laws than those prevailing in the ego. It is in fact the discovery of these differences that has led to our new view and justifies it.

The *repressed* is to be counted as belonging to the id and is subject to the same mechanisms; it is distinguished from it only in respect of its genesis. The differentiation is accomplished in the earliest period of life, while the ego is developing out of the id. At that time a portion of the contents of the id is taken into the ego and raised to the preconscious state; another portion is not affected by this translation and remains behind in the id as the unconscious proper. In the further course of the formation of the ego, however, certain psychical impressions and processes in the ego are excluded [i.e. expelled] from it by a defensive process; the characteristic of being preconscious is withdrawn from them, so that they are once more reduced to being component portions of the id. Here then is the 'repressed' in the id. So far as intercourse between the two mental provinces is concerned, we therefore assume that, on the one hand, unconscious processes in the id are raised to the
[97] level of the preconscious and incorporated into the ego, and that, on the other hand, preconscious material in the ego can follow the opposite path and be put back into the id. The fact that later on a special region – that of the 'superego' ['*Über-Ichs*'][T] – is separated off in the ego lies outside our present interest.[1]

1 [Some discussion of the superego can, however, be found below (p. 106).]

All of this may appear to be far from simple.[1] But when one has grown reconciled to this unusual spatial view of the mental apparatus, it can present no particular difficulties to the imagination [*der Vorstellung*][T]. I will add the further comment that the psychical topography that I have developed here has nothing to do with the anatomy of the brain, and actually only touches it at one point.[2] What is unsatisfactory in this picture – and I am aware of it as clearly as anyone – is due to our complete ignorance of the *dynamic* nature of the mental processes. We tell ourselves that what distinguishes a conscious idea from a preconscious one, and the latter from an unconscious one, can only be a modification, or perhaps a different distribution, of psychical energy. We talk of cathexes and hypercathexes, but beyond this we are without any knowledge on the subject or even any starting point for a serviceable working hypothesis. Of the phenomenon of consciousness we can at least say that it was originally attached to perception. All sensations which originate from the perception of painful, tactile, auditory or visual stimuli are what are most readily conscious. Thought processes, and whatever may be analogous to them in the id, are in themselves unconscious and obtain access to consciousness by becoming linked to the mnemic residues of visual and auditory perceptions along the path of the function of language.[3] In animals, which lack language, these conditions must be of a simpler kind.

The impressions of early traumas, from which we started out, are either not translated into the preconscious or are quickly put back by repression into the id condition. Their mnemic residues are in that case unconscious and operate from the id. We believe we can easily follow their further vicissitudes so long as it is a question of what has been experienced by the subject himself. But a fresh complication arises when we become aware of the probability that what may be operative in an individual's psychical life may include not only what he has experienced himself but also things that were innately present in him at his birth, elements with a phylogenetic origin – an *archaic heritage*. The questions then arise of what this consists in, what it contains and what is the evidence for it. [98]

1 [A fuller account is given in Lecture XXXI of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 51 ff.]

2 [This single point, as Freud explains in parallel accounts in *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 24, and *The Ego and the Id* (1923*b*), ibid., **19**, 16, lies in the system *Pcpt.-Cs.*, which Freud regarded as cortical both in anatomy and in his metapsychology.]

3 [For a long technical discussion of this, see Part VII of the metapsychological paper on 'The Unconscious' (1915*e*), ibid., **14**, 177 ff.]

The immediate and most certain answer is that it consists in certain [innate] dispositions such as are characteristic of all living organisms: in the capacity and tendency, that is, to enter particular lines of development and to react in a particular manner to certain excitations, impressions and stimuli. Since experience shows that there are distinctions in this respect between individuals of the human species, the archaic heritage must include these distinctions; they represent what we recognize as the *constitutional* factor in the individual. Now, since all human beings, at all events in their early days, have approximately the same experiences, they react to them, too, in a similar manner; a doubt was therefore able to arise whether we should not include these reactions, along with their individual distinctions, in the archaic heritage. This doubt should be put on one side: our knowledge of the archaic heritage is not enlarged by the fact of this similarity.

Nevertheless, analytic research has brought us a few results which give us cause for thought. There is, in the first place, the universality of symbolism in language. The symbolic representation of one object by another – the same thing applies to actions – is familiar to all our children and comes to them, as it were, as a matter of course. We cannot show in regard to them how they have learnt it and must admit that in many cases learning it is impossible. It is a question of an original knowledge which adults afterwards forget. It is true that an adult makes use of the same symbols in his dreams, but he does not understand them unless an analyst interprets [*deutet*] them to him, and even then he is reluctant to believe the translation [*Übersetzung*][T]. If he makes use of one of the very common figures of speech in which this symbolism is recorded, he is obliged to admit
[99] that its true sense has completely escaped him. Moreover, symbolism disregards differences of language; investigations would probably show that it is ubiquitous – the same for all peoples. Here, then, we seem to have an assured instance of an archaic heritage dating from the period at which language developed. But another explanation might still be attempted. It might be said that we are dealing with thought connections between ideas – connections which had been established during the historical development of speech and which have to be repeated now every time the development of speech has to be gone through in an individual. It would thus be a case of the inheritance of an intellectual disposition [*Denkdisposition*] similar to the ordinary inheritance of a drive disposition – and once again it would be no contribution to our problem.

The work of analysis has, however, brought something else to light which exceeds in its importance what we have so far considered. When we study the reactions to early traumas, we are quite often surprised to find that they are not strictly limited to what the subject himself has really experienced but diverge from it in a way which fits in much better with the model of a phylogenetic event and, in general, can only be explained by such an influence. The behaviour of neurotic children towards their parents in the Oedipus and castration complex abounds in such reactions, which seem unjustified in the individual case and only become intelligible phylogenetically – by their connection with the experience of earlier generations. It would be well worthwhile to place this material, which I am able to appeal to here, before the public in a collected form. Its evidential value seems to me strong enough for me to venture on a further step and to posit the assertion that the archaic heritage of human beings comprises not only dispositions but also contents – memory traces of the experience of earlier generations. In this way the compass as well as the importance of the archaic heritage would be significantly extended.

On further reflection I must admit that I have behaved for a long time as though the inheritance of memory traces of the experience of our ancestors, independently of direct communication and of the influence of education by the setting of an example, were established beyond question. When I spoke of the survival of a tradition among a people or of the formation of a people's character, I had mostly in mind an inher- [100]
ited tradition of this kind and not one transmitted by communication. Or at least I made no distinction between the two and was not clearly aware of my audacity in neglecting to do so. My position, no doubt, is made more difficult by the present attitude of biological science, which refuses to hear of the inheritance of acquired characteristics by succeeding generations. I must, however, in all modesty confess that nevertheless I cannot do without this factor in biological evolution. The same thing is not in question, indeed, in the two cases: in the one it is a matter of acquired characteristics which are hard to grasp, in the other of memory traces of external events – something tangible, as it were. But it may well be that at bottom we cannot imagine one without the other.

If we assume the survival of these memory traces in the archaic heritage, we have bridged the gulf between individual and group psychology: we can deal with peoples as we do with an individual neurotic. Granted that at the time we have no stronger evidence for the presence of memory traces in the archaic heritage than the residual phenomena

of the work of analysis which call for a phylogenetic derivation, yet this evidence seems to us strong enough to postulate that such is the fact. If it is not so, we shall not advance a step further along the path we entered on, either in analysis or in group psychology. The audacity cannot be avoided.

And by this assumption we are effecting something else. We are diminishing the gulf which earlier periods of human arrogance had torn too wide apart between mankind and the animals. If any explanation is to be found of what are called the instincts[1] of animals, which allow them to behave from the first in a new situation in life as though it were an old and familiar one – if any explanation at all is to be found of this instinctual life of animals, it can only be that they bring the experiences of their species with them into their own new existence – that is, that they have preserved memories of what was experienced by their ancestors. The position in the human animal would not at bottom be different. His own archaic heritage corresponds to the instincts of animals even though it is different in its compass and contents.

[101] After this discussion I have no hesitation in declaring that men have always known (in this special way) that they once possessed a primal father and killed him.

Two further questions must now be answered. First, under what conditions does a memory of this kind enter the archaic heritage? And, secondly, in what circumstances can it become active – that is, can it advance to consciousness from its unconscious state in the id, even though in an altered and distorted shape? The answer to the first question is easy to formulate: the memory enters the archaic heritage if the event was important enough, or repeated often enough, or both. In the case of parricide both conditions are fulfilled. On the second question there is this to be said. A whole number of influences may be concerned, not all of which are necessarily known. A spontaneous development is also conceivable, on the analogy of what happens in some neuroses. What is certainly of decisive importance, however, is the awakening of the forgotten memory trace by a recent real repetition of the event. The murder of Moses was a repetition of this kind and, later, the supposed judicial murder of Christ: so that these events come into the foreground as causes. It seems as though the genesis of monotheism

1 [Here and in the remainder of this paragraph the German word is '*Instinkt*' and not '*Trieb*'. Similarly on p. 120 below. In the *SE* both German terms were translated 'instinct'; see *RSE*, **24**, 85–8.]

could not do without these occurrences. We are reminded of the poet's words:

> Was unsterblich im Gesang soll leben,
> Muss im Leben untergehn.[1]

And lastly a remark which brings up a psychological argument. A tradition that was based only on communication could not lead to the compulsive character [*Zwangscharakter*] that attaches to religious phenomena. It would be listened to, judged, and perhaps dismissed, like any other piece of information from outside; it would never attain the privilege of being liberated from the constraint [*Zwang*] of logical thought. It must have undergone the fate of being repressed, the condition of lingering in the unconscious, before it is able to display such powerful effects on its return, to bring the masses under its spell, as we have seen with astonishment and hitherto without comprehension in the case of religious tradition. And this consideration weighs heavily in favour of our believing that things really happened in the way we have tried to picture them or at least in some similar way.[2] [102]

1 [Literally 'What is to live immortal in song must perish in life.'] Schiller, 'Die Götter Griechenlands'.

2 [The discussion of the 'archaic heritage' in this section is by far the longest in Freud's *published* writings. The question of the relative parts played in mental life by heredity and experience was, of course, a repeated topic for discussion from the earliest times. But this particular point of the possibility of the inheritance of actual ancestral experiences had appeared relatively late in Freud's writings. The problem of the transmission of ancestral experiences was necessarily raised in *Totem and Taboo* (1912–13*a*). 'What are the ways and means', Freud asks there, 'employed by one generation in order to hand on its mental states to the next one?' (*RSE*, **13**, 145.) His reply in this passage is non-committal, though he seems to suggest that the process can be accounted for by conscious and unconscious communication from one generation to another. But it is not difficult to see that even then he had other ideas at the back of his mind. Indeed, the possibility of the inheritance of an 'archaic constitution as an atavistic vestige' is explicitly mentioned there in connection with ambivalence (ibid., **13**, 68), and, in this same connection, the term '*archaisches Erbteil*' (translated 'archaic inheritance') appears in 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 115. It seems probable that these ideas were precipitated (like so much else) in connection with the 'Wolf Man' analysis and particularly with the topic of 'primal phantasies'. This analysis was actually in progress while Freud was writing *Totem and Taboo* and his first draft of the case history was written in 1914. The possibility of a 'phylogenetic heritage' had, however, also arisen in connection with symbolism. This question was discussed somewhat allusively in Lecture X of the *Introductory Lectures*, ibid., **15**, 144–5, and more explicitly in a sentence near the beginning of Lecture XIII, ibid., 173. The first definite reference to the inheritance of primal phantasies seems to have been in Lecture XXIII of the *Introductory Lectures* (1917), ibid., **16**, 327, but it was further developed in one of the passages added after this to the 'Wolf Man' case history (ibid., **17**, 87). The actual term '*archaische Erbschaft*' seems to appear for the first time in 1919 – in a paragraph added in that year to Chapter VII (B) of *The Interpretation of Dreams*, ibid., **5**, 490, in 'A Child is Being Beaten', ibid., **17**, 188, and in Freud's Preface to Reik's book on religious origins, ibid., **17**, 256. Thereafter the concept and the term appear frequently, though only in Chapter III of *The Ego and the Id* is the subject discussed at any length (ibid., **19**, 31–3). (A late reference to the question can be found in Section VI of 'Analysis Terminable and Interminable' (1937*c*), p. 217 below.) The whole question of Freud's views on the inheritance of acquired characteristics is discussed by Ernest Jones in Chapter 10 of Vol. 3 of his life of Freud (1957). See also Editors' notes in (1905*d*), *RSE*, **7**, 117 *n*. 1, and (1985*a* [1915]), ibid., **14**, 236–8.]

PART II

SUMMARY AND RECAPITULATION

[103] The part of this study which follows cannot be given to the public without extensive explanations and apologies. For it is nothing other than a faithful (and often word for word) repetition of the first part [of the third essay], abbreviated in some of its critical enquiries and augmented by additions relating to the problem of how the special character of the Jewish people arose. I am aware that a method of exposition such as this is no less inexpedient than it is inartistic. I myself deplore it unreservedly. Why have I not avoided it? The answer to that is not hard for me to find, but it is not easy to confess. I found myself unable to wipe out the traces of the history of the work's origin, which was in any case unusual.

Actually it has been written twice:[1] for the first time a few years ago in Vienna, where I did not think it would be possible to publish it. I determined to give it up; but it tormented me like an unlaid ghost, and I found a way out by making two pieces of it independent and publishing them in our periodical *Imago*: the psychoanalytic starting point of the whole thing 'Moses an Egyptian' [Essay I], and the historical construction erected on this 'If Moses was an Egyptian . . .' [Essay II]. The remainder, which included what was really open to objection and dangerous – the application [of these findings] to the genesis of monotheism and the view of religion in general – I held back, as I thought, for ever. Then, in March 1938, came the unexpected German invasion, which forced me to leave my home but also freed me from my anxiety lest my publication might conjure up a prohibition of psychoanalysis in a place where it was still tolerated. I had scarcely arrived in England before I found the temptation irresistible to make the knowledge I had held back accessible to the world, and I began to revise the third part of my study to fit it on to the two parts that had already been published. This naturally involved a partial rearrangement of the material. I did not succeed, however, in including the whole of this material in my second version; on the other hand I could not make up
[104] my mind to give up the earlier versions entirely. And so it has come about that I have adopted the expedient of attaching a whole piece of

1 [See Editors' Note, p. 3 f. above.]

the first presentation to the second unchanged – which has brought with it the disadvantage of involving extensive repetition.

I might, however, console myself with the reflection that the things I am treating are in any case so new and so important, apart from how far my account of them is correct, that it can be no misfortune if the public is obliged to read the same thing about them twice over. There are things which should be said more than once and which cannot be said often enough. But the reader must decide of his own free will whether to linger over the subject or to come back to it. He must not be surreptitiously led into having the same thing put before him twice in one book. It is a piece of clumsiness for which the author must take the blame. Unluckily an author's creative power does not always obey his will: the work proceeds as it can, and often presents itself to the author as something independent or even alien.[1]

1 [Freud had said something similar at rather greater length near the beginning of Lecture XXIV of the *Introductory Lectures*, *RSE*, **16**, 334.]

A. THE PEOPLE OF ISRAEL

[105] If we are clear in our mind that a procedure like ours of accepting what seems to us serviceable in the material presented to us and of rejecting what does not suit us and of putting the different pieces together in accordance with psychological probability – if we are clear that a technique of this kind can give no certainty that we shall arrive at the truth, then it may justly be asked why we are undertaking this work at all. The answer is an appeal to the work's outcome. If we greatly tone down the strictness of the requirements made upon a historico-psychological investigation, it will perhaps be possible to throw light on problems which have always seemed to deserve attention and which recent events have forced upon our observation anew. As we know, of all the peoples who lived round the basin of the Mediterranean in antiquity, the Jewish people is almost the only one which still exists in name and also in substance. It has met misfortunes and ill-treatment with an unexampled capacity for resistance; it has developed special character traits and incidentally has earned the hearty dislike of every other people. We should be glad to understand more of the source of this viability of the Jews and of how their characteristics are connected with their history.

We may start from a character trait of the Jews which dominates their relation to others. There is no doubt that they have a particularly high opinion of themselves, that they regard themselves as more distinguished, of higher standing, as superior to other peoples – from whom they are also distinguished by many of their customs.[1] At the same time they are inspired by a peculiar confidence in life, such as is derived from the secret ownership of some precious possession, a kind of optimism: pious people would call it trust in God.

[106] We know the reason for this behaviour and what their secret treasure is. They really regard themselves as God's chosen people, they believe that they stand especially close to him; and this makes them proud and confident. Trustworthy reports tell us that they behaved in Hellenistic times just as they do today, so that the complete Jew was already there; and the Greeks, among whom and alongside of whom they lived, reacted to the Jewish characteristics in the same way as their 'hosts' do today. It might be thought that they reacted as though they too believed in the superiority which the people of Israel claimed for themselves. If one is

1 The aspersion, so common in antiquity, that the Jews were 'lepers' (cf. Manetho [*History of Egypt*, English translation, 1940, 119 ff.]) no doubt has the sense of a projection: 'they keep as much apart from us as though we were lepers.' [Manetho (*c.* 300 B.C.), an Egyptian priest, wrote his *History* in Greek from older Egyptian sources. Only fragments of it survive.]

the declared favourite of the dreaded father, one need not be surprised at the jealousy of one's brothers and sisters, and the Jewish legend of Joseph and his brethren shows very well where this jealousy can lead. The course of world history seemed to justify the presumption of the Jews, since, when later on it pleased God to send mankind a Messiah and redeemer, he once again chose him from the Jewish people. The other peoples might have had occasion then to say to themselves: 'Indeed, they were right, they *are* God's chosen people.' But instead of this, what happened was that redemption by Jesus Christ only intensified their hatred of the Jews, while the Jews themselves gained no advantage from this second act of favouritism, since they did not recognize the redeemer.

On the basis of our earlier discussions, we may now assert that it was the man Moses who imprinted this trait – significant for all time – upon the Jewish people. He raised their self-esteem by assuring them that they were God's chosen people, he enjoined them to holiness [p. 109 below] and pledged them to be apart from others. Not that other peoples were lacking in self-esteem. Just as today, so in those days each nation thought itself better than any other. But the self-esteem of the Jews was given a religious anchorage by Moses: it became a part of their religious faith. Owing to their especially intimate relation to their God they acquired a share in his grandeur. And since we know that behind the God who had chosen the Jews and freed them from Egypt stands the figure of Moses, who had done precisely that, ostensibly at God's command, we venture to declare that it was this one man Moses who created the Jews. It is to him that this people owes its tenacity of life but also much of the hostility it has experienced and still experiences.

B. THE GREAT MAN

How is it possible for a single man to evolve such extraordinary effectiveness that he can form a people out of random individuals and families, can stamp them with their definitive character and determine their fate for thousands of years? Is not a hypothesis such as this a relapse into the mode of thought which led to myths of a creator and to the worship of heroes, into times in which the writing of history was nothing more than a report of the deeds and destinies of single individuals, of rulers or conquerors? The modern tendency is rather towards tracing back the events of human history to more concealed, general and impersonal factors, to the compelling influence of economic [107]

conditions, to alterations in food habits, to advances in the use of materials and tools, to migrations brought about by increases in population and climatic changes. Individuals have no other part to play in this than as exponents or representatives of group trends, which are bound to find expression and do so in these particular individuals largely by chance.

These are perfectly justifiable lines of approach, but they give us occasion for drawing attention to an important discrepancy between the attitude taken up by our organ of thought and the arrangement of things in the world, which are supposed to be grasped by means of our thought. It is enough for our need to discover causes (which, to be sure, is imperative) if each event has *one* demonstrable cause.[1] But in the reality lying outside us that is scarcely the case; on the contrary, each event seems to be overdetermined and proves to be the effect of several convergent causes. Frightened by the immense complication of events, our investigations take the side of one correlation as against another and set up contradictions which do not exist but have only arisen owing to
[108] a rupture of more comprehensive relations.[2] Accordingly, if the investigation of a particular case demonstrates to us the transcendent influence of a single personality, our conscience need not reproach us with having by this hypothesis flown in the face of the doctrine of the importance of the general and impersonal factors. There is room in principle for both. In the case of the genesis of monotheism, however, we can point to no external factor other than the one we have already mentioned – that this development was linked with the establishment of closer relations between different nations and with the building up of a great empire.

Thus we reserve a place for 'great men' in the chain, or rather the network, of causes. But it may not, perhaps, be quite useless to enquire under what conditions we confer this title of honour. We shall be surprised to find that it is never quite easy to answer this question. A first formulation – 'we do so if a man possesses to a specially high degree qualities that we value greatly' – clearly misses the mark in every respect. Beauty, for instance, and muscular strength, however enviable they

1 [Freud had made this point before in the third of his *Five Lectures* (1910*a*), *RSE*, **11**, 37. – The fact of multiple causation was constantly insisted on by him from early times. See, for instance, Chapter IV, Section 1, of *Studies on Hysteria* (1895*d*), ibid., **2**, 234.]

2 I protest, however, against being misunderstood to say that the world is so complicated that any assertion one may make is bound to hit upon a piece of truth somewhere. No. Our thought has upheld its liberty to discover dependent relations and connections to which there is nothing corresponding in reality; and it clearly sets a very high value on this gift, since it makes such copious use of it both inside and outside of science.

may be, constitute no claim to 'greatness'. It would seem, then, that the qualities have to be mental [*geistige*] ones – psychical [*psychische*] and intellectual [*intellektuelle*] distinctions. As regards these, we are held up by the consideration that nevertheless we should not unhesitatingly describe someone as a great man simply because he was extraordinarily efficient in some particular sphere. We should certainly not do so in the case of a chess master or of a virtuoso on a musical instrument; but not very easily, either, in the case of a distinguished artist or scientist. In such cases we should naturally speak of him as a great poet, painter, mathematician or physicist, or as a pioneer in the field of this or that activity; but we refrain from pronouncing him a great man. If we unhesitatingly declare that, for instance, Goethe and Leonardo da Vinci and Beethoven were great men, we must be led to it by something other than admiration for their splendid creations. If precisely such examples as these did not stand in the way, the idea would probably occur to us that the name of a 'great man' is preferably reserved for men of action [109]
– conquerors, generals, rulers – and is in recognition of the greatness of their achievement, the force of the effects to which they gave rise. But this too is unsatisfactory and is entirely contradicted by our condemnation of so many worthless figures whose effects upon their contemporary world and upon posterity can nevertheless not be disputed. Nor shall we be able to choose success as a sign of greatness, when we reflect on the majority of great men who instead of achieving success have perished in misfortune.

For the moment, then, we are inclined to decide that it is not worthwhile to look for a connotation of the concept of a 'great man' that is unambiguously determined. It seems to be only a loosely used and somewhat arbitrarily conferred recognition of an over-large development of certain human qualities, with some approximation to the original literal sense of 'greatness'. We must recollect, too, that we are not so much interested in the essence of great men as in the question of the means by which they affect their fellow men. We will, however, keep this enquiry as short as possible, since it threatens to lead us far away from our goal.

Let us, therefore, take it for granted that a great man influences his fellow men in two ways: by his personality and by the idea [*Idee*] which he puts forward. That idea may stress some ancient wishful image of the masses, or it may point out a new wishful aim to them, or it may cast its spell over them in some other way. Occasionally – and this is undoubtedly the more primary case – the personality works by itself and the idea

plays a quite trivial part. Not for a moment are we in the dark as to why a great man ever becomes important. We know that in the mass of mankind there is a powerful need for an authority who can be admired, before whom one bows down, by whom one is ruled and perhaps even ill-treated. We have learnt from the psychology of individual men what the origin is of this need of the masses. It is a longing for the father felt by everyone from his childhood onwards, for the same father whom the hero of legend boasts he has overcome. And now it may begin to dawn on us that all the characteristics with which we equipped the great man are paternal characteristics, and that the essence of great men for which we vainly searched lies in this conformity. The decisiveness of thought, the strength of will, the energy of action are part of the picture of a
[110] father – but above all the autonomy and independence of the great man, his divine unconcern which may grow into ruthlessness. One must admire him, one may trust him, but one cannot avoid being afraid of him too. We should have been led to realize this from the word itself: who but the father can have been the 'great man' in childhood?[1]

There is no doubt that it was a mighty prototype of a father which, in the person of Moses, stooped to the poor Jewish bondsmen to assure them that they were his dear children. And no less overwhelming must have been the effect upon them of the idea [*Vorstellung*] of an only, eternal, almighty God, to whom they were not too mean for him to make a covenant with them and who promised to care for them if they remained loyal to his worship. It was probably not easy for them to distinguish the image of the man Moses from that of his God; and their feeling was right in this, for Moses may have introduced traits of his own personality into the character of his God – such as his wrathful temper and his relentlessness. And if, this being so, they killed their great man one day, they were only repeating a misdeed which in ancient times had been committed, as prescribed by law, against the Divine King and which, as we know, went back to a still more ancient prototype.[2]

If on the one hand we thus see the figure of the great man grown to divine proportions, yet on the other hand we must recall that the father too was once a child. The great religious idea for which the man Moses stood was, on our view, not his own property: he had taken it over from King Akhenaten. And he, whose greatness as the founder of a religion is unequivocally established, may perhaps have been following hints

1 [In German '*der grosse Mann*' means not only 'the great man' but 'the tall man' or 'the big man'.]

2 Cf. Frazer, loc. cit. [See p. 82 *n.* 2 above.]

which had reached him – from near or distant parts of Asia – through the medium of his mother[1] or by other paths.

We cannot follow the chain of events further, but if we have rightly recognized these first steps, the monotheist idea returned like a boomerang to the land of its origin. Thus it seems unfruitful to try to fix the credit due to an individual in connection with a new idea. It is clear that many have shared in its development and made contributions to it. And, [111]
again, it would obviously be unjust to break off the chain of causes at Moses and to neglect what was effected by those who succeeded him and carried on his ideas, the Jewish Prophets. The seed of monotheism failed to ripen in Egypt. The same thing might have happened in Israel after the people had thrown off the burdensome and exacting religion. But there constantly arose from the Jewish people men who revived the fading tradition, who renewed the admonitions and demands made by Moses, and who did not rest till what was lost had been established once again. In the course of constant efforts over centuries, and finally owing to two great reforms, one before and one after the Babylonian exile, the transformation was accomplished of the popular god Yahweh into the God whose worship had been forced upon the Jews by Moses. And evidence of the presence of a peculiar psychical aptitude in the masses who had become the Jewish people is revealed by the fact that they were able to produce so many individuals prepared to take on the burdens of the religion of Moses in return for the reward of being the chosen people and perhaps for some other prizes of a similar degree.

C. THE ADVANCE IN INTELLECTUALITY[2]

In order to bring about lasting psychical results in a people, it is clearly not enough to *assure* them that they have been chosen by the deity. The fact must also be *proved* to them in some way if they are to believe it and to draw consequences from the belief. In the religion of Moses the Exodus from Egypt served as the proof; God, or Moses in his name, never tired of appealing to this evidence of favour. The feast of the Passover was introduced in order to maintain the memory of that event, or, rather, an old-established feast was injected with the contents of that memory. Nevertheless, it was only a memory: the Exodus belonged to [112]

1 [The theory held at one time, that Akhenaten's mother, Queen Tiye, was of foreign origin, has been abandoned in view of the discovery of her parents' tomb at Thebes.]

2 [This section, as has been mentioned in the Editors' Note, p. 3 above, appeared first separately in *Int. Z. Psychoan. Imago*, **24** (1939), 6–9. Two variants from the final version are noted below. For a discussion of the English rendering of the title see the footnote on p. 79 above.]

a hazy past. In the present, signs of God's favour were decidedly scanty; the people's history pointed rather to his *dis*favour. Primitive peoples used to depose their gods or even to castigate them, if they failed to do their duty in securing them victory, happiness and comfort. In all periods kings have been treated in no way differently from gods; an ancient identity is thus revealed: an origin from a common root. Thus, modern peoples, too, are in the habit of expelling their kings if the glory of their reign is spoilt by defeats and the corresponding losses in territory and money. Why the people of Israel, however, clung more and more submissively to their God the worse they were treated by him – that is a problem which for the moment we must leave on one side.

It may encourage us to enquire whether the religion of Moses brought the people nothing else besides an enhancement of their self-esteem owing to their consciousness of having been chosen. And indeed another factor can easily be found. That religion also brought the Jews a far grander conception of God, or, as we might put it more modestly, the conception of a grander God. Anyone who believed in this God had some kind of share in his greatness, might feel exalted himself. For an unbeliever this is not entirely self-evident; but we may perhaps make it easier to understand if we point to the sense of superiority felt by a Briton in a foreign country which has been made insecure owing to an insurrection – a feeling that is completely absent in a citizen of any small continental state. For the Briton counts on the fact that his government[1] will send along a warship if a hair of his head is hurt, and that the rebels understand that very well – whereas the small state possesses no warship at all. Thus, pride in the greatness of the British Empire[2] has a root as well in the consciousness of the greater security – the protection – enjoyed by the individual Briton. This may resemble the conception of a grand God. And, since one can scarcely claim to assist God in the administration of the world, the pride in God's greatness fuses with the pride in being chosen by him.

Among the precepts of the Moses religion there is one that is of greater importance than appears to begin with. This is the prohibition
[113] against making an image of God – the compulsion to worship a God whom one cannot see.[3] In this, I suspect, Moses was outdoing the strictness of the Aten religion. Perhaps he merely wanted to be consistent: his God would in that case have neither a name nor a countenance.

1 [In English in the original.]

2 [Also in English.]

3 [Cf. p. 25 above.]

Perhaps it was a fresh measure against magical abuses.[1] But if this prohibition were accepted, it must have a profound effect. For it meant that a sensory perception was given second place to what may be called an abstract idea [*Vorstellung*] – a triumph of intellectuality over sensuality or, strictly speaking, a renunciation of drive, with all its necessary psychological consequences.

This may not seem obvious at first sight, and before it can carry conviction we must recall other processes of the same character in the development of human civilization [*Kultur*]. The earliest of these and perhaps the most important is merged in the obscurity of primaeval ages. Its astonishing effects compel us to assert its occurrence. In our children, in adults who are neurotic, as well as in primitive peoples, we meet with the mental [*seelische*] phenomenon which we describe as a belief in the 'omnipotence of thoughts'. In our judgement this lies in an overestimation of the influence which our mental (in this case, intellectual [*intellektuellen*]) acts can exercise in altering the external world. At bottom, all magic, the precursor to our technology, rests on this premise. All the magic of words, too, has its place here, and the conviction of the power which is bound up with the knowledge and pronouncing of a name. The 'omnipotence of thoughts' was, we suppose, an expression of the pride of mankind in the development of language, which resulted in such an extraordinary advancement of intellectual activities. The new realm of intellectuality [*Geistigkeit*] was opened up, in which ideas, memories and inferences became decisive in contrast to the lower psychical activity which had direct perceptions by the sense organs as its content. This was unquestionably one of the most important stages on the path to hominization [p. 69 *n.* 1 above].

We can far more easily grasp another process of a later date. Under the influence of external factors into which we need not enter here and which are also in part insufficiently known, it came about that the matriarchal social order was succeeded by the patriarchal one – which, of course, involved a revolution in the juridical conditions that had so far prevailed. An echo of this revolution seems still to be audible in the *Oresteia* of Aeschylus.[2] But this turning from the mother to the father points in addition to a victory of intellectuality over sensuality – that is, an advance in civilization, since maternity is proved by the evidence of [114]

1 [Cf. a remark on this in *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 79 *n.* 1.]

2 [The theme of this trilogy is the murder of Agamemnon by his wife Clytemnestra, the vengeance taken on her by their son Orestes, his pursuit by the Furies, and his trial and acquittal by the court of the Areopagus in Athens.]

the senses while paternity is a hypothesis, based on an inference and a premise. Taking sides in this way with a thought process in preference to a sense perception has proved to be a momentous step.

At some point between the two events that I have mentioned[1] there was another which shows the most affinity to what we are investigating in the history of religion. Human beings found themselves obliged in general to recognize 'intellectual [*geistige*]' forces – forces, that is, which cannot be grasped by the senses (particularly by sight) but which nonetheless produce undoubted and indeed extremely powerful effects. If we may rely upon the evidence of language, it was movement of the air that provided the prototype of intellectuality [*Geistigkeit*], for intellect [*Geist*] derives its name from a breath of wind – '*animus*', '*spiritus*',[2] and the Hebrew '*ruach* (breath)'. This too led to the discovery of the mind [*Seele* (soul)] as that of the intellectual [*geistigen*] principle in individual human beings. Observation found the movement of air once again in men's breathing, which ceases when they die. To this day a dying man 'breathes out his spirit [*Seele*]'. Now, however, the world of spirits [*Geisterreich*] lay open to men. They were prepared to attribute the soul [*Seele*] which they had discovered in themselves to everything in Nature. The whole world was animate [*beseelt*]; and science, which came so much later, had plenty to do in divesting part of the world of its soul [*entseelen*] once more; indeed it has not completed that task even today.[3]

[115] The Mosaic prohibition elevated God to a higher degree of intellectuality, and the way was opened to further alterations in the idea of God which we have still to describe. But we may first consider another effect of the prohibition. All such advances in intellectuality have as their consequence that the individual's self-esteem is increased, that he is made proud – so that he feels superior to other people who have remained under the spell of sensuality. Moses, as we know, conveyed to the Jews an exalted sense of being a chosen people. The dematerialization of God brought a fresh and valuable contribution to their secret treasure. The Jews retained their inclination to intellectual interests. The nation's political misfortune taught it to value at its true worth the one possession that remained to it – its literature. Immediately after the

1 [Between the development of language and the end of the matriarchy.]

2 [In the original version of this section (see p. 101 *n.* 2 above) the Greek word '*ἄνεμος* (anemos, wind)' appears here as well.]

3 [It will have been seen that this last paragraph is untranslatable. '*Geist*' means not only 'intellect' but also 'spirit' and 'soul'. '*Seele*' means 'soul', 'spirit' and 'mind'. For a full discussion of the problem presented by the translation of these terms, see *RSE*, **24**, 82–4.]

destruction of the Temple in Jerusalem by Titus, the Rabbi Jochanan ben Zakkai asked permission to open the first Torah school in Jabneh.[1] From that time on, the Holy Writ and intellectual concern with it were what held the scattered people together.

This much is generally known and accepted. All I have wanted to do is to add that this characteristic development of the Jewish nature was introduced by the Mosaic prohibition against worshipping God in a visible form.

The pre-eminence given to intellectual labours throughout some two thousand years in the life of the Jewish people has, of course, had its effect. It has helped to check the brutality and the tendency to violence which are apt to appear where the development of muscular strength is the popular ideal. Harmony in the cultivation of intellectual and physical activity, such as was achieved by the Greek people, was denied to the Jews. In this dichotomy their decision was at least in favour of the worthier alternative.[2]

D. RENUNCIATION OF DRIVE

[116] It is not obvious and not immediately understandable why an advance in intellectuality, a setback to sensuality, should raise the self-regard both of an individual and of a people. It seems to presuppose the existence of a definite standard of value and of some other person or agency which maintains it. For an explanation let us turn to an analogous case in individual psychology which we have come to understand.

If the id in a human being gives rise to a drive demand of an erotic or aggressive nature, the simplest and most natural thing is that the ego, which has the apparatus of thought and the muscular apparatus at its disposal, should satisfy the demand by an action. This satisfaction of the drive is felt by the ego as pleasure [*Lust*][T], just as its non-satisfaction would undoubtedly have become a source of unpleasure [*Unlust*]. Now a case may arise in which the ego abstains from satisfying the drive in view of external obstacles – namely, if it perceives that the action in question would provoke a serious danger to the ego. An abstention from satisfaction of this kind, the renunciation of a drive on account of an external hindrance – or, as we say, in obedience to the reality

1 [He is reputed to have escaped from Jerusalem in a coffin, and to have obtained leave from the Roman general to start a college for instruction in the Law (*Torah*) at a town near the sea to the west of Jerusalem (A.D. 70).]

2 [In the original version (see p. 101 *n.* 2 above): 'the alternative that was more significant culturally.']

principle – is not pleasurable in any event. The renunciation of the drive would lead to a lasting tension owing to unpleasure, if it were not possible to reduce the strength of the drive itself by displacements of energy. Drive renunciation can, however, also be imposed for other reasons, which we correctly describe as *internal*. In the course of an individual's development a portion of the inhibiting forces in the external world are internalized and an agency is constructed in the ego which confronts the rest of the ego in an observing, criticizing and prohibiting sense. We call this new agency the *superego*. Thenceforward the ego, before putting to work the drive satisfactions demanded by the id, has to take into account not merely the dangers of the external world but also the objections of the superego, and it will have all the more grounds for abstaining from satisfying the drive. But whereas drive renunciation, when it is for external reasons, is *only* unpleasurable, when it is for internal reasons,
[117] in obedience to the superego, it has a different economic effect. In addition to the inevitable unpleasurable consequences it also brings the ego a yield of pleasure – a substitutive satisfaction, as it were. The ego feels elevated; it is proud of the drive renunciation, as though it were a valuable achievement. We believe we can understand the mechanism of this yield of pleasure. The superego is the successor and representative of the individual's parents (and educators) who had supervised his actions in the first period of his life; it carries on their functions almost unchanged. It keeps the ego in a permanent state of dependence and exercises a constant pressure on it. Just as in childhood, the ego is apprehensive about risking the love of its supreme master; it feels his approval as liberation and satisfaction and his reproaches as pangs of conscience. When the ego has brought the superego the sacrifice of a renunciation of drive, it expects to be rewarded by receiving more love from it. The consciousness of deserving this love is felt by it as pride. At the time when the authority had not yet been internalized as a superego, there could be the same relation between the threat of loss of love and the claims of drive: there was a feeling of security and satisfaction when one had achieved a drive renunciation out of love for one's parents. But this happy feeling could only assume the peculiar narcissistic character of pride after the authority had itself become a portion of the ego.

What help does this explanation of the satisfaction arising from drive renunciation give us towards understanding the processes that we want to study – the elevation of self-regard when there are advances in intellectuality? Very little, it seems. The circumstances are quite different. There is no question of any drive renunciation and there is no

second person or agency for whose sake the sacrifice is made. We shall soon feel doubts about this last assertion. It can be said that the great man is precisely the authority for whose sake the achievement is carried out; and, since the great man himself operates by virtue of his similarity to the father, there is no need to feel surprise if in group psychology the role of the superego falls to him. So that this would apply too to the man Moses in relation to the Jewish people. As regards the other point, however, no proper analogy can be established. An advance in intellectuality [*Geistigkeit*] consists in deciding against direct sense perception in favour of what are known as the higher intellectual [*intellektuellen*] processes – that is, memories, reflections [118] and inferences. It consists, for instance, in deciding that paternity is more important than maternity, although it cannot, like the latter, be established by the evidence of the senses, and that for that reason the child should bear his father's name and be his heir. Or it declares that our God is the greatest and mightiest, although he is invisible like a gale of wind or like the soul. The rejection of a sexual or aggressive drive demand seems to be something quite different from this. Moreover, in the case of some advances in intellectuality – for instance, in the case of the victory of patriarchy – we cannot point to the authority which lays down the standard which is to be regarded as higher. It cannot in this case be the father, since he is elevated into being an authority only by the advance itself. Thus we are faced with the phenomenon that in the course of the development of humanity sensuality is gradually overpowered by intellectuality and that men feel proud and exalted by every such advance. But we are unable to say why this should be so. It further happens later on that intellectuality itself is overpowered by the very puzzling emotional phenomenon of faith. Here we have the celebrated '*credo quia absurdum*',[1] and, once more, anyone who has succeeded in this regards it as a supreme achievement. Perhaps the common element in all these psychological situations is something else. Perhaps men simply pronounce that what is more difficult is higher, and their pride is merely their narcissism augmented by the consciousness of a difficulty overcome.

These are certainly not very fruitful considerations, and it might be thought that they have nothing at all to do with our enquiry as to what has determined the character of the Jewish people. That would only be to our advantage; but a certain connection with our problem is betrayed nevertheless by a fact which will concern us still more later on. The

1 [See footnote 1, p. 78 above.]

religion which began with the prohibition against making an image of God develops more and more in the course of centuries into a religion of drive renunciations. It is not that it would demand sexual *abstinence*; it is content with a marked restriction of sexual freedom. God, however, becomes entirely removed from sexuality and elevated into the ideal of ethical perfection. But ethics is a limitation of drive. The Prophets never tire of asseverating that God requires nothing other
[119] from his people than a just and virtuous conduct of life – that is, abstention from every drive satisfaction which is still condemned as vicious by our morality today as well. And even the demand for belief in him seems to take a second place in comparison with the seriousness of these ethical requirements. In this way drive renunciation seems to play a prominent part in the religion, even if it did not stand out in it from the first.

This is the place, however, for an interpolation, in order to avoid a misunderstanding. Even though it may seem that drive renunciation and the ethics founded on it do not form part of the essential content of religion, yet genetically they are most intimately connected with it. Totemism,[1] which is the earliest form of a religion which we recognize, carries with it, as indispensable constituents of its system, a number of commands and prohibitions which have no other significance, of course, than as drive renunciations: the worship of the totem, which includes a prohibition against injuring or killing it, exogamy – that is, renunciation of the passionately desired mothers and sisters in the horde – the granting of equal rights to all the members of the fraternal alliance – that is, restricting the inclination to violent rivalry among them. In these regulations are to be seen the first beginnings of a moral and social order. It does not escape us that two different motives are at work here. The first two prohibitions operate on the side of the father who has been got rid of: they carry on his will, as it were. The third command – the granting of equal rights to the allied brothers – disregards the father's will; it is justified by an appeal to the necessity for permanently maintaining the new order which succeeded the father's removal. Otherwise a relapse into the earlier state would have become inevitable. It is here that social commands diverge from the others which, as we might say, are derived directly from religious connections.

The essential part of this course of events is repeated in the abbreviated development of the human individual. Here, too, it is the

1 [Cf. above, p. 74 ff.]

authority of the child's parents – essentially, that of his autocratic father, threatening him with his power to punish – which calls on him for a renunciation of drive and which decides for him what is to be allowed and what forbidden. Later on, when Society and the superego have taken the parents' place, what in the child was called 'well behaved' or 'naughty' is described as 'good' and 'evil' or 'virtuous' and 'vicious'. But [120]
it is still always the same thing – drive renunciation under the pressure of the authority which replaces and prolongs the father.

A further depth is added to these discoveries when we examine the remarkable concept of holiness. What is it really that seems to us 'holy' in preference to other things that we value highly and recognize as important?[1] On the one hand, the connection of holiness [or sacredness] with what is religious is unmistakable. It is insisted upon emphatically: everything religious is sacred, it is the very core of sacredness. On the other hand, our judgement is disturbed by the numerous attempts to apply the characteristic of sacredness to so many other things – people, institutions, functions – which have little to do with religion. These efforts serve obvious tendentious purposes. Let us start from the prohibitive character which is so firmly attached to sacredness. What is sacred is obviously something that may not be touched. A sacred prohibition has a very strong emotional tone but has in fact no rational basis. For why, for instance, should incest with a daughter or sister be such a specially serious crime – so much worse than any other sexual intercourse?[2] If we ask for a rational basis we shall certainly be told that all our feelings rebel against it. But that only means that people regard the prohibition as self-evident and that they know of no basis for it.

It is easy enough to show the futility of such an explanation. What is represented as insulting our most sacred feelings was a universal custom – we might call it a usage made holy – among the ruling families of the ancient Egyptians and of other early peoples. It was taken as a matter of course that a Pharaoh should take his sister as his first and principal [121]
wife; and the later successors of the Pharaohs, the Greek Ptolemies, did

1 [The word '*heilig*', here translated either 'sacred' or 'holy', was discussed by Freud somewhat differently in his paper on '"Civilized" Sexual Morality and Modern Nervous Illness' (1908*d*), *RSE*, **9**, 163–4. The gist of this earlier argument is already to be seen in a remarkable short paragraph headed 'Definition of "Holiness"' in a communication sent by Freud to Fliess on May 31, 1897 (Freud, 1950*a*, Draft N), ibid., **1**, 284. The word '*heilig*' appears also, as applied to *persons* in the sense of 'saintly', in Chapter VII of *Civilization and its Discontents* (1930*a*), ibid., **21**, 113. The wider aspects of the present topic are also considered in the same chapter. See especially ibid., 112–17.]

2 [The 'horror of incest' is the subject of the first essay in *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 11 ff., and is also mentioned in Draft N (cf. footnote 1 above).]

not hesitate to follow that model. We are compelled, rather, to a realization that incest – in this instance between a brother and sister – was a privilege which was withheld from common mortals and reserved to kings as representatives of the gods, just as similarly no objection was taken to incestuous relations of this kind in the world of Greek and Germanic legend. It may be suspected that the scrupulous insistence upon equality of birth among our aristocracy is a relic of this ancient privilege and it can be established that, as a result of the inbreeding practised over so many generations in the highest social strata, Europe is ruled today by members of a single family and a second one.

Evidence of incest among gods, kings and heroes helps us as well to deal with another attempt, which seeks to explain the horror of incest biologically and to trace it to an obscure knowledge of the damage done by inbreeding. It is not even certain, however, that there *is* any danger of damage from inbreeding – let alone that primitive peoples can have recognized it and reacted against it. The uncertainty in defining the permitted and forbidden degrees of kinship argues just as little in favour of the hypothesis that a 'natural feeling' is the ultimate basis of the horror of incest.

Our construction of prehistory forces us to another explanation. The command in favour of exogamy, of which the horror of incest is the negative expression, was a product of the will of the father and carried this will on after he had been removed. Hence come the strength of its emotional tone and the impossibility of finding a rational basis for it – that is, its sacredness. We confidently expect that an investigation of all the other cases of a sacred prohibition would lead to the same conclusion as in that of the horror of incest: that what is sacred was originally nothing other than the prolongation of the will of the primal father. This would also throw light on the hitherto incomprehensible ambivalence of the words which express the concept of sacredness. It is the ambivalence which in general dominates the relation to the father. [The Latin] '*sacer*' means not only 'sacred', 'consecrated', but also something that we can only translate as 'infamous', 'detestable'
[122] (e.g. '*auri sacra fames*').[1] But the father's will was not only something which one might not touch, which one had to hold in high respect, but also something one trembled before, because it demanded a painful drive renunciation. When we hear that Moses made his people holy [p. 29 above] by introducing the custom of circumcision we now

1 ['Execrable hunger for gold.' Virgil, *Aeneid*, VI, 816. Cf. 'The Antithetical Meaning of Primal Words' (1910*e*), *RSE*, **11**, 147.]

understand the deep meaning of that assertion. Circumcision is the symbolic substitute for the castration which the primal father once inflicted upon his sons in the plenitude of his absolute power, and whoever accepted that symbol was showing by it that he was prepared to submit to the father's will, even if it imposed the most painful sacrifice on him.

Going back to ethics, we may say in conclusion that a part of its precepts are justified rationally by the necessity for delimiting the rights of society as against the individual, the rights of the individual as against society and those of individuals as against one another. But what seems to us so grandiose about ethics, so mysterious and, in a mystical fashion, so self-evident owes these characteristics to its connection with religion, its origin from the will of the father.

E. WHAT IS TRUE IN RELIGION

How enviable, to those of us who are poor in faith, do those enquirers seem who are convinced of the existence of a Supreme Being! To that great Spirit [*Geist*] the world offers no problems, for he himself created all its institutions. How comprehensive, how exhaustive and how definitive are the doctrines of believers compared with the laborious, paltry and fragmentary attempts at explanation which are the most we are able to achieve! The divine Spirit, which is itself the ideal of ethical perfection, has planted in men the knowledge of that ideal and, at the same time, the urge to assimilate their own nature to it. They perceive directly what is higher and nobler and what is lower and more base. Their affective life is regulated in accordance with their distance from the ideal at any moment. When they approach it – at their perihelion, as it were – they are brought high satisfaction; when, at their aphelion, they have become remote from it, the punishment is severe unpleasure. All of this is laid down so simply and so unshakeably. We can only regret [123]
that certain experiences in life and observations in the world make it impossible for us to accept the premise of the existence of such a Supreme Being. As though the world had not riddles enough, we are set the new problem of understanding how these other people have been able to acquire their belief in the Divine Being and whence that belief obtained its immense power, which overwhelms 'reason and science'.[1]

Let us return to the more modest problem which has occupied us hitherto. We wanted to explain the origin of the special character of the

1 [An allusion to an ironical remark by Mephistopheles in Goethe's *Faust*, Part I, Scene 4.]

Jewish people, a character which is probably what has made their survival to the present day possible. We found that the man Moses impressed this character on them by giving them a religion which increased their self-esteem so much that they thought themselves superior to all other peoples. Thereafter they survived by keeping apart from others. Mixtures of blood interfered little with this, since what held them together was an ideal factor, the possession in common of certain intellectual [*intellektueller*] and emotional wealth. The religion of Moses led to this result because (1) it allowed the people to take a share in the grandeur of a new idea of God, (2) it asserted that this people had been chosen by this great God and were destined to receive evidences of his special favour and (3) it forced upon the people an advance in intellectuality [*Geistigkeit*] which, important enough in itself, opened the way, in addition, to the appreciation of intellectual work and to further renunciations of drive.

This is what we have arrived at. And, though we do not wish to take back any of it, we cannot hide from ourselves that it is somehow or other unsatisfying. The cause does not, so to speak, match the effect; the fact that we want to explain seems to be of a different order of magnitude from everything by which we explain it. May it be that all the investigations we have so far made have not uncovered the whole of the motivation but only a certain superficial layer, and that behind it another very important factor awaits discovery? In view of the extraordinary complexity of all causation in life and history, something of the sort was to be expected.

[124] Access to this deeper motivation would seem to be given at a particular point in the previous discussions. The religion of Moses did not produce its effects immediately but in a remarkably indirect manner. This does not mean to say simply that it did not work at once, that it took long periods of time, hundreds of years, to deploy its full effect, for that is self-evident when it is a question of the imprinting of a people's character. But the restriction relates to a fact which we have derived from the history of the Jewish religion or, if you like, have introduced into it. We have said that after a certain time the Jewish people rejected the religion of Moses once more – whether they did so completely or retained some of its precepts we cannot guess. If we suppose that in the long period of the seizure of Canaan and the struggle with the peoples inhabiting it the Yahweh religion did not differ essentially from the worship of the other Baalim [p. 64 above], we shall be on historical ground in spite of all the later tendentious efforts to throw a veil over this shaming state of things.

The religion of Moses, however, had not disappeared without leaving a trace. A kind of memory of it had survived, obscured and distorted, supported, perhaps, among individual members of the priestly caste by ancient records. And it was this tradition of a great past which continued to work in the background, as it were, which gradually gained more and more power over men's minds, and which finally succeeded in transforming the god Yahweh into the god of Moses and in calling back to life the religion of Moses which had been established and then abandoned long centuries earlier.

In a previous portion of this study [Sections C, D and E of Part I, p. 66 ff. above] we have considered what assumption seems inevitable if we are to find such an achievement of tradition comprehensible.

F. THE RETURN OF THE REPRESSED

There is a quantity of similar processes among those which the analytic investigation of mental life has taught us to know. Some of them are described as pathological, others are counted among the diversity of normal events. But that matters little, since the boundaries between the [125]
two [the pathological and the normal] are not sharply drawn, their mechanisms are to a large extent the same, and it is of far more importance whether the alterations in question take place in the ego itself or whether they confront it as alien to it – in which case they are known as symptoms.

From the mass of material I shall first bring forward some cases which relate to the development of character. Take, for instance, the girl who has reached a state of the most decided opposition to her mother. She has cultivated all those characteristics which she has seen that her mother lacked, and has avoided everything that reminded her of her mother. We may supplement this by saying that in her early years, like every female child, she adopted an identification with her mother and that she is now rebelling against this energetically. But when this girl marries and herself becomes a wife and a mother, we need not be surprised to find that she begins to grow more and more like the mother to whom she was so antagonistic, till finally the identification with her which she surmounted is unmistakably re-established. The same thing happens too with boys; and even the great Goethe, who in the period of his genius certainly looked down upon his unbending and pedantic father, in his old age developed traits which formed a part of his father's character. The outcome can become even more striking when

the contrast between the two personalities is sharper. A young man whose fate it was to grow up beside a worthless father began by developing, in defiance of him, into a capable, trustworthy and honourable person. In the prime of life his character was reversed, and thenceforward he behaved as though he had taken this same father as a model. In order not to miss the connection with our theme, we must keep in mind the fact that at the beginning of such a course of events there is always an identification with the father in early childhood. This is afterwards repudiated, and even overcompensated, but in the end establishes itself once more.

It has long since become common knowledge that the experiences of a person's first five years exercise a determining effect on his life, which nothing later can withstand. Much that deserves knowing might be said about the way in which these early impressions maintain themselves against any influences in more mature periods of life – but it would not
[126] be relevant here. It may, however, be less well known that the strongest compulsive influence arises from impressions which impinge upon a child at a time when we would have to regard his psychical apparatus as not yet completely receptive. The fact itself cannot be doubted; but it is so puzzling that we may make it more comprehensible by comparing it with a photographic exposure which can be developed after any interval of time and transformed into a picture. I am nevertheless glad to point out that this uncomfortable discovery of ours has been anticipated by an imaginative writer, with the boldness that is permitted to poets. E. T. A. Hoffmann used to trace back the wealth of figures that put themselves at his disposal for his creative writings to the changing images and impressions which he had experienced during a journey of some weeks in a post-chaise while he was still an infant at his mother's breast.[1] What children have experienced at the age of two and have not understood need never be remembered by them except in dreams; they may only come to know of it through psychoanalytic treatment. But at some later time it will break into their life with obsessional impulses [*Zwangsimpulsen*], it will govern their actions, it will decide their sympathies and antipathies and will quite often determine their choice of a love object, for which it is so frequently impossible to find a rational basis. The two points at which these facts touch upon our problem cannot be mistaken.

1 [The source of this reference has not been discovered.]

First, there is the remoteness of the period concerned,[1] which is recognized here as the truly determining factor – in the special state of the memory, for instance, which in the case of these childhood experiences we classify as 'unconscious'. We expect to find an analogy in this with the state which we are seeking to attribute to tradition in the mental life of the people. It was not easy, to be sure, to introduce the idea of the unconscious into group psychology.

Regular contributions [secondly] are made to the phenomena we are in search of by the mechanisms which lead to the formation of neuroses. Here again the determining events occur in early childhood times, but here the stress is not upon the *time* but upon the process by which the event is met, the reaction to it. We can describe it schematically thus. As a result of the experience, a drive demand arises which calls for satisfaction. The ego refuses that satisfaction, either because it is paralysed by the magnitude of the demand or because it recognizes it as a danger. The former of these grounds is the more primary one; both of them amount to the avoidance of a situation of danger.[2] The ego fends off the danger by the process of repression. The drive impulse is in some way inhibited, its precipitating cause, with its attendant perceptions and ideas, is forgotten. This, however, is not the end of the process: the drive has either retained its forces, or collects them again, or it is reawakened by some new precipitating cause. Thereupon it renews its demand, and, since the path to normal satisfaction remains closed to it by what we may call the scar of repression, somewhere, at a weak spot, it opens another path for itself to what is known as a substitutive satisfaction, which comes to light as a symptom, without the acquiescence of the ego, but also without its understanding. All the phenomena of the formation of symptoms may justly be described as the 'return of the repressed'.[3] Their distinguishing characteristic, however, is the far-reaching distortion to which the returning material has been subjected as compared with the original. It will perhaps be thought that this last group of facts has carried us too far away from the similarity with tradition. But we ought not to regret it if it has brought us close to the problems of the renunciation of drive. [127]

1 Here, too, a poet may speak. In order to explain his attachment, he imagines: 'Ach, du warst in abgelebten Zeiten meine Schwester oder meine Frau.' [Literally 'Ah, you were, in a past life, my sister or my wife.' From a poem dedicated by Goethe to Charlotte von Stein: 'Warum gabst du uns die tiefen Blicke.' Freud had quoted it in his Goethe House address (1930*e*), *RSE*, **21**, 197.]

2 [For 'situations of danger' see Addendum B in Chapter XI of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 146 ff.]

3 [The term, as well as the concept, go back at least to Freud's second paper on the neuropsychoses of defence (1896*b*), ibid., **3**, 179.]

G. HISTORICAL TRUTH

We have undertaken all these psychological diversions in order to make it more credible to us that the religion of Moses only carried
[128] through its effect on the Jewish people as a tradition. It is likely that we have not achieved more than a certain degree of probability. Let us suppose, however, that we have succeeded in completely proving it. Even so the impression would remain that we have merely satisfied the *qualitative* factor of what was demanded, but not the quantitative one as well. There is an element of grandeur about everything to do with the origin of a religion, certainly including the Jewish one, and this is not matched by the explanations we have hitherto given. Some other factor must be involved to which there is little that is analogous and nothing that is of the same kind, something unique and something of the same order of magnitude [*Grössenordnung*] as what has come out of it, as religion itself. [Cf. p. 111 f. above.]

Let us try to approach the subject from the opposite direction. We understand how a primitive man is in need of a god as creator of the universe, as chief of his clan, as personal protector. This god takes his position behind the dead fathers [of the clan], about whom tradition still has something to say. A man of later days, of our own day, behaves in the same way. He, too, remains childish and in need of protection, even when he is grown up; he thinks he cannot do without support from his god. That much is undisputed. But it is less easy to understand why there may only be a *single* god, why precisely the advance from henotheism[1] to monotheism acquires an overwhelming significance. No doubt it is true, as we have explained [pp. 96 f. and 112 above], that the believer has a share in the greatness of his god; and the greater the god the more reliable is the protection which he can offer. But a god's power does not necessarily presuppose that he is the only one. Many peoples regarded it only as a glorification of their chief god if he ruled over other deities who were inferior to him, and they did not think it diminished his greatness if there were other gods besides him. No doubt, if this god became a universal one and had all countries and peoples as his concern, it meant a sacrifice of intimacy, too. It was as though one were sharing one's god with the foreigners and one had to make up for this by the proviso that one was preferred by him. We can make the further point

1 [The word has not been very clearly defined. It is used to mean the belief of a community in one particular god of its own, and also to mean the belief in the dominance of one particular god over a hierarchy of other gods. In neither case does the belief imply that the god in question is the *only* god.]

that the idea of a single god means in itself an advance in intellectuality, [129]
but it is impossible to rate this point so highly.

Pious believers, however, know how to fill this obvious gap in motivation adequately. They say that the idea of a single god produced such an overwhelming effect on men because it is a portion of the eternal *truth* which, long concealed, came to light at last and was then bound to carry everyone along with it. We must admit that a factor of this kind is at last something that matches the magnitude both of the subject and of its effect.

We too would like to accept this solution. But we are brought up by a doubt. The pious argument rests on an optimistic and idealistic premise. It has not been possible to demonstrate in other connections that the human intellect has a particularly fine flair for the truth or that the human mind shows any special inclination for recognizing the truth. We have rather found, on the contrary, that our intellect very easily goes astray without any warning, and that nothing is more easily believed by us than what, without reference to the truth, comes to meet our wishful illusions. We must for that reason add a reservation to our agreement. We too believe that the pious solution contains the truth – but the *historical* truth and not the *material* truth. And we assume the right to correct a certain distortion to which this truth has been subjected on its return. That is to say, we do not believe that there is a single great god today, but that in primaeval times there was a single person who was bound to appear huge at that time and who afterwards returned in men's memory elevated to divinity.

We had assumed that the religion of Moses was to begin with rejected and half-forgotten and afterwards broke through as a tradition. We are now assuming that this process was being repeated then for the second time. When Moses brought the people the idea of a single god, it was not a novelty but signified the revival of an experience in the primaeval ages of the human family which had long vanished from men's conscious memory. But it had been so important and had produced or paved the way for such deeply penetrating changes in men's life that we cannot avoid believing that it had left behind it in the human mind some permanent traces, which can be compared to a tradition.

We have learnt from the psychoanalyses of individuals that their [130]
earliest impressions, received at a time when the child was scarcely yet capable of speaking, produce at some time or another effects of a compulsive character without themselves being consciously remembered. We believe we have a right to make the same assumption

about the earliest experiences of the whole of humanity. One of these effects would be the emergence of the idea of a single great god – an idea which must be recognized as a completely justified memory, though, it is true, one that has been distorted. An idea such as this has a compulsive character: it *must* be believed. To the extent to which it is distorted, it may be described as a *delusion*; insofar as it brings a return of the past, it must be called the *truth*. Psychiatric delusions, too, contain a small fragment of truth and the patient's conviction extends over from this truth on to its delusional wrappings.[1]

What follows, from here to the end, is a slightly modified repetition of the discussions in Part I [of the present (third) essay].

In 1912 I attempted, in my *Totem and Taboo*, to reconstruct the ancient situation from which these consequences followed. In doing so, I made
[131] use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psychoanalysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotic rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. From Atkinson I took, in continuation of this account, the idea that this patriarchal system ended in a rebellion by the sons, who banded together against their father, overcame him and devoured him in common. Basing myself on Robertson Smith's totem theory, I assumed that subsequently the father horde gave place to the totemic brother clan. In order to be able to live in peace with one another, the victorious brothers renounced the women on whose account they had, after all, killed their father, and instituted exogamy. The power of

1 [The notion contained in this last sentence had been expressed by Freud in very similar terms in the first edition of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 220. Similarly in *Gradiva* (1907*a*), ibid., **9**, 62 f. The matter was investigated more deeply in Section B of the paper on 'Some Neurotic Mechanisms' (1922*b*), ibid., **18**, 217 ff.; but the general idea can be followed much further back – to the second paper on the neuropsychoses of defence (1896*b*), ibid., **3**, 191 ff., and to passages in the Fliess correspondence dating from January 24, 1897 and January 1, 1896 (Freud, 1950*a*, Letter 57 and the section on paranoia in Draft K). – The related distinction drawn in this section between 'historical' and 'material' truth is of much more recent origin. There may be a hint of it in *The Future of an Illusion* (1927*c*), *RSE*, **21**, 41–2, and there is a more definite allusion to it in connection with myths in the paper on the acquisition of fire (1932*a*), ibid., **22**, 204. But the first explicit reference is in the 'Postscript' to the *Autobiographical Study* (1935*a*), ibid., **20**, 64, where, oddly enough, the idea is mentioned as being already before the world, though in fact it was not put into print before 'Constructions in Analysis' (1937*d*), p. 242 ff. below. The subject has already been touched upon above, pp. 54 and 78. – For a reference to a possibly analogous distinction between psychical and external reality see p. 70 f. above.]

fathers was broken and the families were organized as a matriarchy. The ambivalent emotional attitude of the sons to their father remained in force during the whole of later development. A particular animal was set up in the father's place as a totem. It was regarded as ancestor and protective spirit and might not be injured or killed. But once a year the whole male community came together to a ceremonial meal at which the totem animal (worshipped at all other times) was torn to pieces and devoured in common. No-one might absent himself from this meal: it was the ceremonial repetition of the killing of the father, with which social order, moral laws and religion had taken their start. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me. [See above, pp. 74–8.]

To this day I hold firmly to this construction. I have repeatedly met with violent reproaches for not having altered my opinions in later editions of my book in spite of the fact that more recent ethnologists have unanimously rejected Robertson Smith's hypotheses and have in part brought forward other, totally divergent theories. I may say in reply that these ostensible advances are well known to me. But I have not been convinced either of the correctness of these innovations or of Robertson Smith's errors. A denial is not a refutation, an innovation is not necessarily an advance. Above all, however, I am not an ethnologist but a psychoanalyst. I had a right to take out of ethnological literature what I might need for the work of analysis. The writings of Robertson Smith [132]
– a man of genius – have given me valuable points of contact with the psychological material of analysis and indications for its employment. I have never found myself on common ground with his opponents.

H. THE HISTORICAL DEVELOPMENT

I cannot here repeat the contents of *Totem and Taboo* in greater detail. But I must undertake to fill up the long stretch between that hypothetical primaeval period and the victory of monotheism in historical times. After the institution of the combination of brother clan, matriarchy, exogamy and totemism, a development began which must be described as a slow 'return of the repressed'. Here I am not using the term 'the repressed' in its proper sense. What is in question is something in a people's life which is past, lost to view, superseded and which we venture to compare with what is repressed in the mental life of an individual. We cannot at first sight say in what form this past existed during the time of its eclipse. It is not easy for us to carry over the

concepts of individual psychology into group psychology; and I do not think we gain anything by introducing the concept of a 'collective' unconscious. The content of the unconscious, indeed, is in any case a collective, universal property of mankind. For the moment, then, we will make shift with the use of analogies. The processes in the life of peoples which we are studying here are very similar to those familiar to us in psychopathology, but nevertheless not quite the same. We must finally make up our minds to adopt the hypothesis that the psychical precipitates of the primaeval period became inherited property which, in each fresh generation, called not for acquisition but only for awakening. In this we have in mind the example of what is certainly the 'innate' symbolism which derives from the period of the development of speech, which is familiar to all children without their being instructed, and which is the same among all peoples despite their different languages. What we may perhaps still lack in certainty here is made good by other products of psychoanalytic research. We find that in a number of
[133] important relations our children react, not in a manner corresponding to their own experience, but instinctively [*instinktmässig*], like the animals, in a manner that is only explicable as phylogenetic acquisition.[1]

The return of the repressed took place slowly and certainly not spontaneously but under the influence of all the changes in conditions of life which fill the history of human civilization. I cannot give a survey here of these determinants nor more than a fragmentary enumeration of the stages of this return. The father once more became the head of the family, but was not by any means so absolute as the father of the primal horde had been. The totem animal was replaced by a god in a series of transitions which are still very plain. To begin with, the god in human form still bore an animal's head; later he turned himself by preference into that particular animal, and afterwards it became sacred to him and was his favourite attendant; or he killed the animal and himself bore its name as an epithet. Between the totem animal and the god, the hero emerged, often as a preliminary step towards deification. The idea of a supreme deity seems to have started early, at first only in a shadowy manner without intruding into men's daily interests. As tribes and peoples came together into larger unities, the gods too organized themselves into families and into hierarchies. One of them was often elevated into being supreme lord over gods and men. After this, the further step was hesitatingly taken of paying respect to only one god,

1 [What Freud has in mind here are no doubt chiefly the 'primal phantasies'. See the Editors' footnote on the 'archaic heritage' (p. 93 *n.* 2 above). Cf. pp. 91–2 above.]

and finally the decision was taken of giving all power to a single god and of tolerating no other gods beside him. Only thus was it that the supremacy of the father of the primal horde was re-established and that the emotions relating to him could be repeated.

The first effect of meeting the being who had so long been missed and longed for was overwhelming and was like the traditional description of the lawgiving from Mount Sinai. Admiration, awe and thankfulness for having found grace in his eyes – the religion of Moses knew none but these positive feelings towards the father god. The conviction of his irresistibility, the submission to his will, could not have been more unquestioning in the helpless and intimidated son of the father of the horde – indeed those feelings only become fully intelligible when they [134] are transposed into the primitive and infantile setting. A child's emotional impulses are intensely and inexhaustibly deep to a degree quite other than those of an adult; only religious ecstasy can bring them back. A rapture of devotion to God was thus the first reaction to the return of the great father.

The direction to be taken by this father-religion was in this way laid down for all time. Yet this did not bring its development to an end. Ambivalence is a part of the essence of the relation to the father: in the course of time the hostility too could not fail to stir, which had once driven the sons into killing their admired and dreaded father. There was no place in the framework of the religion of Moses for a direct expression of the murderous hatred of the father. All that could come to light was a mighty reaction against it – a sense of guilt on account of that hostility, a bad conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of the religious system, had yet another superficial motivation, which neatly disguised its true origin. Things were going badly for the people; the hopes resting on the favour of God failed in fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their own sinfulness offered a welcome means of exculpating God: they deserved no better than to be punished by him since they had not obeyed his commandments. And, driven by the need to satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they must make those commandments grow ever stricter, more meticulous and even more trivial. In a fresh rapture of moral asceticism they imposed more and more new drive renunciations

on themselves and in that way reached – in doctrine and precept, at least – ethical heights which had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment of ethical heights as the second main characteristic and the second great achievement of their religion. The way in which it was connected with the first one – the idea of a single god – should be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the sense of guilt felt on
[135] account of a suppressed hostility to God. They possess the characteristic – uncompleted and incapable of completion – of obsessional neurotic reaction-formations; we can guess, too, that they serve the secret purposes of punishment.

The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull malaise, a premonition of calamity for which no-one could suggest a reason. Historians of our day speak of an ageing of ancient civilization [*Kultur*], but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject matter of monotheism;[1] it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced

1 [Namely, the fact of the existence of the primal father.]

with the hypothesis of what must be described as a shadowy 'original sin'.

Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. It must remain uncertain whether there was a ringleader and instigator to the murder [136] among the band of brothers who rebelled against the primal father, or whether such a figure was created later by the imagination [*Phantasie*] of creative artists in order to turn themselves into heroes, and was then introduced into the tradition. After the Christian doctrine had burst the framework of Judaism, it took up components from many other sources, renounced a number of characteristics of pure monotheism and adapted itself in many details to the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.

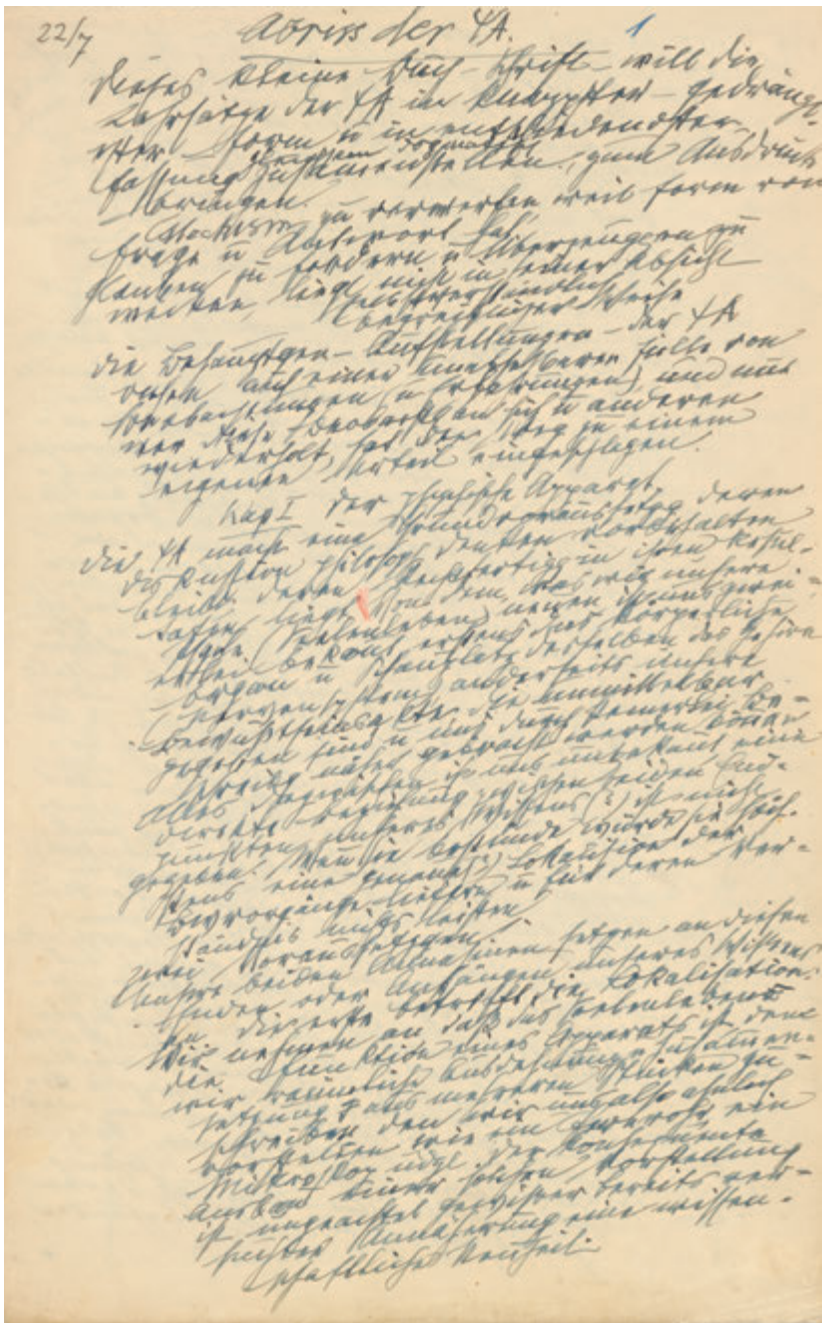
Only a portion of the Jewish people accepted the new doctrine. Those who refused to are still called Jews today. Owing to this cleavage, they have become even more sharply divided from other peoples than before. They were obliged to hear the new religious community (which, besides Jews, included Egyptians, Greeks, Syrians, Romans and eventually Germans) reproach them with having murdered God. In full, this reproach would run as follows: 'They will not accept it as true that they murdered God, whereas we admit it and have been cleansed of that guilt.' It is easy therefore to see how much truth lies behind this reproach. A special enquiry would be called for to discover why it has been impossible for the Jews to join in this forward step which was implied, in spite of all its distortions, by the admission of having murdered God. In a certain sense they have in that way taken a tragic load of guilt on themselves; they have been made to pay heavy penance for it.

Our investigation may perhaps have thrown a little light on the question of how the Jewish people have acquired the characteristics which distinguish them. Less light has been thrown on the problem of how it is

[137] that they have been able to retain their individuality till the present day. But exhaustive answers to such riddles cannot in fairness be either demanded or expected. A contribution, to be judged in view of the limitations which I mentioned at the start [p. 96 above], is all that I can offer.

An Outline of Psychoanalysis

(1940 [1938])



First page of the manuscript of *An Outline of Psychoanalysis*

First page of the manuscript of An Outline of Psychoanalysis

In a letter to Max Eitingon dated November 13, 1934, Freud wrote: 'I do not share the almost fetishistic respect for MSS [manuscripts]. I do not care anything for mine and only keep them because I have been told of the possibility that they might someday bring in some pocket money for my grandchildren.'

An Outline of Psycho-Analysis
1940 *Int. J. Psycho-Anal.*, **21** (1), 27–82. (Tr. James Strachey.)
1949 London: Hogarth Press and Institute of Psycho-Analysis. Pp. ix + 84. (Revised reprint of above in book form.)
1949 New York: Norton. Pp. 127. (Reprint of above.)
1964 *SE*, **23**, 144–207. (Considerably revised version of the 1949 translation.)
1986 *PFL*, **15**, 375–443. (Reprint of above.)
2003 *PMC*, *An Outline of Psychoanalysis*, 173–236. (Tr. Helena Ragg-Kirkby.)

The present translation is a revised and corrected version of the *SE* translation.

When this work was first published, both in German and English, it was accompanied by two long extracts from Freud's contemporary fragment 'Some Elementary Lessons in Psycho-Analysis' (1940*b* [1938]). These extracts appeared as a footnote in Chapter IV of the German version (see p. 143 below) and as an Appendix in the English one. The manuscript from which the extracts were drawn was published in full soon afterwards (it appears below on p. 263 ff.) and the footnote and Appendix were consequently omitted in the subsequent reprints of the present work.

By an unfortunate oversight, the author's 'Preface' (p. 130 below) was omitted from the first *GW* reprint and is thus to be found in German in the *GW*, **Nachtr.** (1987), 749. It should be remarked that Volume 17 of the *Gesammelte Werke*, which was the first of its volumes to be published (in 1941), was also issued simultaneously with a different title page and binding, as *Schriften aus dem Nachlass* ('Posthumous Writings').

The manuscript of this whole work is written out in an abbreviated form. In particular the third chapter ('The Development of the Sexual Function', p. 138 below) is for the most part greatly abbreviated, with the omission, for instance, of definite and [142]

indefinite articles and of many principal verbs – in what may be described as a telegraphic style. The German editors, as they tell us, expanded these abbreviations. The general sense is not in doubt and, although the editing is at certain points more than a little free, it has seemed simplest to accept it and to translate the version supplied in the *Gesammelte Werke*. However, some of the editorial interventions revealed by Ilse Grubrich-Simitis's (1993) detailed study of the original manuscript clearly demand notice. The most striking of these are amended in this revised translation (and identified in the Editors' footnotes).

Part I of the work was not given a title by the author. The German editors adopted for the purpose 'Die Natur des Psychischen' ('The Nature of the Psychical') which is a crossheading in the contemporary fragment mentioned above, 'Some Elementary Lessons in Psycho-Analysis' (p. 264 below). For the *SE* a rather more general title was devised, and this is retained in the present edition.

There is some conflict as to when Freud began writing the *Outline*. According to Ernest Jones (1957, 255) 'he began it during the waiting time in Vienna' – which would mean April or May, 1938. The manuscript, however, bears on its opening page the date 'July 22', which confirms the statement of the German editors that the work was begun in July, 1938 – that is to say, soon after Freud's arrival in London at the beginning of June. By early September he had written the 66 sheets of his draft for the *Outline*, when his work on it was interrupted by his having to undergo a very serious operation, and he did not return to it again, though he began shortly afterwards on another expository work ('Some Elementary Lessons in Psycho-Analysis') but very soon broke this off as well.

The telegraphic style of the *Outline* resulted in a misapprehension (by the editors of the *GW* and *SE* both) that it was unfinished. Subsequent examination of the manuscript by Ilse Grubrich-Simitis (1993, 276–86; trans., 217–26) in relation to drafts and fair copies of Freud's other papers has revealed that what has survived is in fact the complete draft version of the *Outline*, and that there apparently never was a fair copy (if indeed Freud intended to publish it at all).

In the long succession of Freud's expository works the *Outline* exhibits a unique character. The others are without exception aimed at explaining psychoanalysis to
[143] an outside public, a public with very varying degrees and types of general approach to Freud's subject, but always a relatively ignorant public. This cannot be said of the *Outline*. It should clearly be understood that this is not a book for beginners; it is something much more like a 'refresher course' for advanced students. The reader is everywhere expected to be familiar not only with Freud's general approach to psychology but also with his findings and theories on quite detailed points. For instance, a couple of very short allusions to the part played by the memory traces of verbal sense impressions (pp. 146–7 and 180 below) would scarcely be intelligible to anyone unacquainted with a number of difficult arguments in the last chapter of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, and in the final section of the metapsychological paper on 'The Unconscious' (1915*e*), ibid., **14**. And again, the very scanty remarks in two or three places on identification and its relation to abandoned love objects (pp. 174 and 185 below) imply a knowledge at least of Chapter III of *The Ego and the Id* (1923*b*), *RSE*, **19**. But those who are already at home in Freud's writings will find this a most fascinating epilogue. New light is thrown on whatever he

touches – the most fundamental theories or the most detailed clinical observations – and everything is discussed in the vocabulary of his very latest terminology. There are even occasional hints at entirely new developments, particularly in the later part of Chapter VIII, where the question of the splitting of the ego and its disavowal of portions of the external world as exemplified in the case of fetishism receives an enlarged consideration. All of this shows that at the age of 82 Freud still possessed an astonishing gift for making a fresh approach to what might have seemed well-worn topics. Nowhere else, perhaps, does his style reach a higher level of succinctness and lucidity. The whole work gives us a sense of freedom in its presentation which is perhaps to be expected in a master's last account of the ideas of which he was the creator.

AN OUTLINE OF PSYCHOANALYSIS
[PREFACE]

[144] The aim of this brief work is to bring together the tenets of psychoanalysis and to state them, as it were, dogmatically – in the most concise form and in the most unequivocal terms. However, it is not the catechism, with its question and answer format.[1] Its intention is naturally not to compel belief or to arouse conviction.

The teachings of psychoanalysis are based on an incalculable number of observations and experiences, and only someone who has repeated those observations on himself and on others is in a position to arrive at a judgement of his own upon it.

1 [This sentence, or rather the abbreviated version of it, was omitted in all previous editions. See Editors' Note above, and Grubrich-Simitis, 1993, 281; trans., 222.]

PART I
[THE MIND AND ITS WORKINGS]

CHAPTER I
THE PSYCHICAL APPARATUS

Psychoanalysis makes a basic assumption, the discussion of which is reserved to philosophical thought but the justification for which lies in its results. We know two kinds of things about what we call our psyche (or mental life [*Seelenleben*][T]): firstly, its bodily organ and scene of *Seele*
action, the brain (or nervous system) and, on the other hand, our acts of consciousness, which are immediate data and cannot be further explained by any sort of description. Everything that lies between is unknown to us, and the data do not include any direct relation between these two terminal points of our knowledge. If it existed, it would at the most afford an exact localization of the processes of consciousness and [145]
would give us no help towards understanding them.

Two Assumptions[1]

Our two hypotheses start out from these ends or beginnings of our knowledge. The first is concerned with localization.[2] We assume that mental life is the function of an apparatus to which we ascribe the characteristics of being extended in space and of being made up of several portions – which we imagine, that is, as resembling a telescope or microscope or something of the kind. Notwithstanding some earlier attempts in the same direction, the consistent working out of a conception [*Vorstellung*][T] such as this is a scientific novelty.

We have arrived at our knowledge of this psychical apparatus by studying the individual development of human beings. To the oldest of these psychical provinces or agencies we give the name of *id* [*Es*][T]. It

1 [This irregular subheading was omitted in all previous editions (Grubrich-Simitis, 1993, 280; trans., 221).]

2 [The second (the assumption that mental life is unconscious in itself) is stated on pp. 142–3 below.]

contains everything that is inherited, that is present at birth, that is laid down in the constitution – above all, therefore, the drives [*Triebe*][T], which originate from the somatic organization and which find a first psychical expression here [in the id] in forms unknown to us.[1]

Under the influence of the real external world around us, one portion of the id has undergone a special development. From what was originally a cortical layer, equipped with the organs for receiving stimuli and with arrangements for acting as a protective shield against stimuli, a special organization has arisen which henceforward acts as an intermediary between the id and the external world. To this region of our mind we have given the name of *ego* [*Ichs*][T].

Here are the principal characteristics of the ego. In consequence of the pre-established connection between sense perception and muscular action, the ego has voluntary movement at its command. It has the task of self-preservation [*Selbstbehauptung*][t]. As regards *external* events, it performs that task by becoming aware of stimuli, by storing up experiences about them (in the memory), by avoiding excessively strong stimuli (through flight), by dealing with moderate stimuli (through adaptation) and finally by learning to bring about expedient changes in the external world to its own advantage (through activity). As regards *internal* events,
[146] in relation to the id, it performs that task by gaining control over the demands of the drives, by deciding whether they are to be allowed satisfaction, by postponing that satisfaction to times and circumstances favourable in the external world or by suppressing their excitations [*Erregungen*][T] entirely. It is guided in its activity by consideration of the tensions produced by stimuli, whether these tensions are present in it or introduced into it. The raising of these tensions is in general felt as *unpleasure* [*Unlust*][T] and their lowering as *pleasure* [*Lust*]. It is probable, however, that what is felt as pleasure or unpleasure is not the *absolute* height of this tension but something in the rhythm of the changes in them. The ego strives for pleasure and seeks to avoid unpleasure. An increase in unpleasure that is expected and foreseen is met by a *signal of*
Angst *anxiety* [*Angstsignal*][T]; the occasion of such an increase, whether it threatens from without or within, is known as a *danger*. From time to time the ego gives up its connection with the external world and withdraws into the state of sleep, in which it makes far-reaching changes in its organization. It is to be inferred from the state of sleep that this organization consists in a particular distribution of mental energy.

1 This oldest portion of the psychical apparatus remains the most important throughout life; moreover, the investigations of psychoanalysis started with it.

The long period of childhood, during which the growing human being lives in dependence on his parents, leaves behind it as a precipitate the formation in his ego of a special agency in which this parental influence is prolonged. It has received the name of *superego* [*Überichs*]^{T}. Insofar as this superego is differentiated from the ego or is opposed to it, it constitutes a third power [*Macht*]^{T} which the ego must take into account.

An action by the ego is as it should be if it satisfies simultaneously the demands of the id, of the superego and of reality – that is to say, if it is able to reconcile their demands with one another. The details of the relation between the ego and the superego become completely intelligible when they are traced back to the child's attitude to its parents. This parental influence of course includes in its operation not only the personalities of the actual parents but also the family, racial and national traditions handed on through them, as well as the demands of the immediate social milieu which they represent. In the same way, the superego, in the course of an individual's development, receives contributions from later successors and substitutes of his parents, such as teachers and models in public life of admired social ideals. It will be observed that, for all their fundamental difference, the id and the superego have one thing [147]
in common: they both represent the influences of the past – the id the influence of heredity, the superego the influence, essentially, of what is taken over from other people – whereas the ego is principally determined by the individual's own experience, that is by accidental and contemporary events.

This general schematic picture of a psychical apparatus may be supposed to apply as well to the higher animals which resemble man mentally. A superego must be presumed to be present wherever, as is the case with man, there is a long period of dependence in childhood. A distinction between ego and id is an unavoidable assumption. Animal psychology has not yet taken in hand the interesting problem which is here presented.

CHAPTER II
THE THEORY OF THE DRIVES

[148] The power [*Macht*] of the id expresses the true purpose of the individual organism's life. This consists in the satisfaction of its innate needs. No such purpose as that of keeping itself alive or of protecting itself from dangers by means of anxiety can be attributed to the id. That is the task of the ego, whose business it also is to discover the most favourable and least perilous method of obtaining satisfaction, taking the external world into account. The superego may bring fresh needs to the fore, but its main function remains the limitation of satisfactions.

The forces [*Kräfte*]^{T} which we assume to exist behind the tensions caused by the needs of the id [*Bedürfnisspannungen des Es*]^{t} are called *drives*. They represent the somatic demands upon the mind. Though they are the ultimate cause of all activity, they are of a conservative nature; the state, whatever it may be, which an organism has reached gives rise to a tendency to re-establish that state so soon as it has been abandoned. It is thus possible to distinguish an indeterminate number of drives, and in common practice this is in fact done. For us, however, the important question arises whether it may not be possible to trace all these numerous drives back to a few basic ones. We have found that drives can change their aim (by displacement [*Verschiebung*]^{T}) and also that they can replace one another – the energy of one drive passing over to another. This latter process is still insufficiently understood. After long hesitancies and vacillations we have decided to assume the existence of only two basic drives, *Eros* and *the destructive drive*. (The *Selbsterhaltung* contrast between the drives to self-preservation [*Selbsterhaltungstrieb*]^{T} and the preservation of the species, as well as the contrast between ego love [*Ichliebe*]^{t} and object love, fall within Eros.) The aim of the first of these basic drives is to establish ever-greater unities and to preserve them thus – in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things. In the case of the destructive drive we may suppose that its final aim is to lead what is living into an inorganic state. For this reason we also call it the *death drive*.

[149] If we assume that living things came later than inanimate ones and arose from them, then the death drive fits in with the formula we have proposed to the effect that drives tend towards a return to an earlier state. In the case of Eros (or the love drive) we cannot apply this formula. To do

so would presuppose that living substance was once a unity which had later been torn apart and was now striving towards reunion.[1]

In biological functions the two basic drives operate against each other or combine with each other. Thus, the act of eating is a destruction of the object with the final aim of incorporating it, including cannibalism,[2] and the sexual act is an act of aggression with the purpose of the most intimate union. This concurrent and mutually opposing action of the two basic drives gives rise to the whole variegation of the phenomena of life. The analogy of our two basic drives extends from the sphere of living things to the pair of opposing forces – attraction and repulsion – which rule in the inorganic world.[3]

Modifications in the proportions of the fusion between the drives have the most tangible results. A surplus of sexual aggressiveness will turn a lover into a sex murderer, while a sharp diminution in the aggressive factor will make him bashful or impotent.

There can be no question of restricting one or the other of the basic drives to one of the provinces of the mind. They must necessarily be met with everywhere. We may picture an initial state as one in which the total available energy of Eros, which henceforward we shall speak of as 'libido', is present in the still undifferentiated ego–id[4] and serves to neutralize the destructive tendencies which are simultaneously present. (We [150]
are without a term analogous to 'libido' for describing the energy of the destructive drive.) At a later stage it becomes relatively easy for us to follow the vicissitudes [*Schicksale*][T] of the libido, but this is more difficult with the destructive drive.

So long as that drive operates internally, as a death drive, it remains silent; it only comes to our notice when it is diverted outwards as a drive to destruction. It seems to be essential for the preservation of the individual that this diversion should occur; the muscular apparatus serves

1 Creative writers have imagined something of the sort, but nothing like it is known to us from the actual history of living substance. [Freud no doubt had in mind among other writings Plato's *Symposium*, which he had quoted in this connection in *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 55, and to which he had alluded earlier still, in the first of the *Three Essays on the Theory of Sexuality* (1905*d*), ibid., **7**, 122. See also Freud's note on p. 276 below, written shortly after the present work.]

2 [These two words were omitted in all previous editions.]

3 This picture of the basic forces or drives, which still arouses much opposition among analysts, was already familiar to the philosopher Empedocles of Acragas. [Freud had discussed Empedocles and his theories at some length in Section VI of his paper on 'Analysis Terminable and Interminable' (1937*c*), pp. 221–3 below. He had included a reference to the dual forces operating in physics in his open letter to Einstein, *Why War?* (1933*b*), *RSE*, **22**, 219 f., as well as in Lecture XXXII of the *New Introductory Lectures* (1933*a*), ibid., **22**, 91.]

4 [See footnote 2, p. 136 below.]

this purpose. When the superego is established, considerable amounts of the aggressive drive are fixated in the interior of the ego and operate there self-destructively. This is one of the dangers to health with which human beings are faced on their path to cultural development [*Kulturentwicklung*][T]. Holding back aggressiveness is in general unhealthy and leads to illness (to mortification[1]). A person in a fit of rage will often demonstrate how the transition from aggressiveness that has been prevented to self-destructiveness is brought about by diverting the aggressiveness against himself: he tears his hair or beats his face with his fists, though he would evidently have preferred to apply this treatment to someone else. Some portion of self-destructiveness remains within, whatever the circumstances; till at last it succeeds in killing the *individual*, not, perhaps, until his libido has been used up or fixated in a disadvantageous way. Thus it may in general be suspected that the *individual* dies of his internal conflicts but that the *species* dies of its unsuccessful struggle against the external world if the latter changes in a fashion which cannot be adequately dealt with by the adaptations which the species has acquired.

Kultur

It is hard to say anything of the behaviour of the libido in the id and in the superego. All that we know about it relates to the ego, in which at first the whole available quota of libido is stored up. We call this state absolute, primary *narcissism*. It lasts till the ego begins to cathect [*besetzen*][T] the ideas [*Vorstellungen*] of objects with libido, to transform narcissistic libido into object libido. Throughout the whole of life the ego remains the great reservoir from which libidinal cathexes are sent out to objects and into which they are also once more withdrawn, just as an amoeba behaves with its pseudopodia.[2] It is only when a person is completely in love that the main quota of libido is transferred on to the object and the object to some extent takes the place of the ego. A characteristic of the libido which is important in life is its *mobility*, the facility with which it passes from one object to another. This must be contrasted with the *fixation* [*Fixierung*][T] of the libido to particular objects, which often persists throughout life.

Besetzung

[151]

There can be no question but that the libido has somatic sources, that it streams to the ego from various organs and parts of the body. This is most clearly seen in the case of that portion of the libido which, from its drive aim, is described as sexual excitation. The most prominent of the

1 ['*Kränkung*' means literally 'making ill'. This same point, including the verbal one, was made by Freud in a lecture on hysteria delivered forty-five years previously. See Freud, 1893*h*; *RSE*, **3**, 35.]

2 [Some discussion of this passage, and of part of another one on p. 135 above, can be found in Appendix B to *The Ego and the Id* (1923*b*), *RSE*, **19**, 57–8.]

parts of the body from which this libido arises are known by the name of '*erotogenic zones*', though in fact the whole body is an erotogenic zone of this kind. The greater part of what we know about Eros – that is to say, about its exponent, the libido – has been gained from a study of the sexual function, which, indeed, on the prevailing view [*Auffassung*][T], even if not according to our theory, coincides with Eros. We have been able to form a picture of the way in which the sexual urge, which is destined to exercise a decisive influence on our life, gradually develops out of successive contributions from a number of component drives, which represent particular erotogenic zones.

CHAPTER III[1]
THE DEVELOPMENT OF THE SEXUAL FUNCTION

Sex [152] According to the prevailing view human sexual life [*Sexualleben*][T] consists essentially in an endeavour to bring one's own genitals into contact with those of someone of the opposite sex. With this are associated, as accessory phenomena and introductory acts, kissing this extraneous body, looking at it and touching it. This endeavour is supposed to make its appearance at puberty – that is, at the age of sexual maturity [*Geschlechtsreife*] – and to serve the purposes of reproduction. Nevertheless, certain facts have always been known which do not fit into the narrow framework of this view. (1) It is a remarkable fact that there are people who are only attracted by individuals of their own sex and by their genitals. (2) It is equally remarkable that there are people whose desires behave exactly like sexual ones but who at the same time entirely disregard the sexual organs or their normal use; people of this kind are known as 'perverts'. (3) And lastly it is a striking thing that some children (who are on that account regarded as degenerate) take a very early interest in their genitals and show signs of excitation in them.

It may well be believed that psychoanalysis provoked astonishment and denials when, partly on the basis of these three neglected facts, it contradicted all the popular opinions on sexuality. Its principal findings are as follows:

(*a*) Sexual life does not begin only at puberty, but starts with plain manifestations soon after birth.

(*b*) It is necessary to distinguish sharply between the concepts of 'sexual' and 'genital'. The former is the wider concept and includes many activities that have nothing to do with the genitals.

(*c*) Sexual life includes the function of obtaining pleasure from zones
Nachträglichkeit of the body – a function which is subsequently [*nachträglich*][T] brought into the service of reproduction. The two functions often fail to coincide completely.

[153] The chief interest is naturally focused on the first of these assertions, the most unexpected of all. It has been found that in early childhood there are signs of bodily activity to which only an ancient prejudice could deny the name of sexual and which are linked to psychical phenomena that we come across later in adult erotic life – such as

1 [A greatly expanded version of the original. See the Editors' Note, pp. 127–8 above.]

fixation to particular objects, jealousy, and so on. It is further found, however, that these phenomena which emerge in early childhood form part of an ordered course of development, that they pass through a regular process of increase, reaching a climax towards the end of the fifth year, after which there follows a lull. During this lull progress is at a standstill and much is unlearnt and there is much recession. After the end of this period of latency, as it is called, sexual life advances once more with puberty; we might say that it has a second efflorescence. And here we come upon the fact that the onset of sexual life is *diphasic*, that it occurs in two waves – something that is unknown except in man and evidently has an important bearing on hominization. [See p. 69 above.][1] It is not a matter of indifference that the events of this early period, except for a few residues, fall victim to *infantile amnesia*. Our views on the aetiology of the neuroses and our technique of analytic therapy are derived from these conceptions; and our tracing of the developmental processes in this early period has also provided evidence for yet other conclusions.

The first organ to emerge as an erotogenic zone and to make libidinal demands on the mind is, from the time of birth onwards, the mouth. To begin with, all psychical activity is concentrated on providing satisfaction for the needs of that zone. Primarily, of course, this satisfaction serves the purpose of self-preservation by means of nourishment; but physiology should not be confused with psychology. The baby's obstinate persistence in sucking gives evidence at an early stage of a need for satisfaction which, though it originates from and is instigated by the taking of nourishment, nevertheless strives to obtain pleasure independently of nourishment and for that reason may and should be termed *sexual*. [154]

During this oral phase sadistic impulses already occur sporadically along with the appearance of the teeth. Their extent is far greater in the second phase, which we describe as the sadistic-anal one, because satisfaction is then sought in aggression and in the excretory function. Our

1 Cf. the suggestion that man is descended from a mammal which reached sexual maturity at the age of five, but that some major external influence was brought to bear on the species and at that point interrupted the straight course of development of sexuality. Other transformations in the sexual life of man as compared with that of animals might be connected with this – such as the abolition of the periodicity of the libido and the exploitation of the part played by menstruation in the relation between the sexes. [The idea of there being a connection between the latency period and the glacial epoch was first made many years earlier by Ferenczi (1913*c*). Freud referred to it with a good deal of caution in *The Ego and the Id* (1923*b*), *RSE*, **19**, 30, and again, with rather greater acquiescence, in *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 137 f. The question of the cessation of periodicity in the sexual function was discussed by Freud at some length in two footnotes to Chapter IV of *Civilization and its Discontents* (1930*a*), ibid., **21**, 90–1 *n.* and 95–6 *n.* 3.]

justification for including aggressive urges under the libido is based on the view that sadism is a drive fusion of purely libidinal and purely destructive urges, a fusion which thenceforward persists uninterruptedly.[1]

The third phase is that known as the phallic one, which is, as it were, a forerunner of the final form taken by sexual life and already much resembles it. It is to be noted that it is not the genitals of both sexes that play a part at this stage, but only the male ones (the phallus). The female genitals long remain unknown: in children's attempts to understand the sexual processes they pay homage to the venerable cloacal theory – a theory which has a genetic [*genetisch*][T] justification.[2]

With the phallic phase and in the course of it the sexuality of early childhood reaches its height and approaches its dissolution. Thereafter boys and girls have different histories. Both have begun to put their intellectual activity at the service of sexual researches; both start off from the premise of the universal presence of the penis. But now the
[155] paths of the sexes diverge. The boy enters the Oedipus phase; he begins to manipulate his penis and simultaneously has phantasies [*Phantasien*][T] of carrying out some sort of activity with it in relation to his mother, till, owing to the combined effect of a threat of castration and the sight of the absence of a penis in females, he experiences the greatest trauma of his life and this introduces the period of latency with all its consequences. The girl, after vainly attempting to do the same as the boy, comes to recognize her lack of a penis or rather the inferiority of her clitoris, with permanent effects on the development of her character; as a result of this first disappointment in rivalry, she often begins by turning away altogether from sexual life.

It would be a mistake to suppose that these three phases succeed one another in a clear-cut fashion. One may appear in addition to another; they may overlap one another, may be present alongside of one another. In the early phases the different component drives set about their pursuit of pleasure independently of one another; in the phallic phase there are the beginnings of an organization which subordinates the other urges to the primacy of the genitals and signifies the start of a coordination of the

1 The question arises whether the satisfaction of purely destructive drive impulses can be felt as pleasure, whether pure destructiveness without any libidinal admixture occurs. Satisfaction of the death drive remaining in the ego seems not to produce feelings of pleasure, though masochism represents a fusion which is entirely analogous to sadism.

2 The occurrence of early vaginal excitations is often asserted. But it is most probable that what is in question are excitations in the clitoris – that is, in an organ analogous to the penis. This does not invalidate our right to describe the phase as phallic.

general urge towards pleasure into the sexual function. The complete organization is only achieved at puberty, in a fourth, genital phase. A state of things is then established in which (1) some earlier libidinal cathexes are retained, (2) others are taken into the sexual function as preparatory, auxiliary acts, the satisfaction of which produces what is known as fore-pleasure, and (3) other urges are excluded from the organization, and are either suppressed altogether (repressed [*verdrängt*][T]) or are employed in the ego in another way, forming character traits or undergoing sublimation with a displacement of their aims. *Verdrängung*

This process is not always performed faultlessly. Inhibitions [*Hemmungen*][T] in its development manifest themselves as the many sorts of disturbance in sexual life. When this is so, we find fixations of the libido to conditions in earlier phases, whose urge, which is independent of the normal sexual aim, is described as *perversion*. One such developmental inhibition, for instance, is homosexuality when it is manifest. Analysis shows that in every case a homosexual object tie was present and in most cases persisted in a *latent* condition. The situation is complicated by the fact that as a rule the processes necessary for bringing about a normal outcome are not completely present or absent, but *partially* [156] present, so that the final result remains dependent on these *quantitative* relations. In these circumstances the genital organization is, it is true, attained, but it lacks those portions of the libido which have not advanced with the rest and have remained fixated to pregenital objects and aims. This weakening shows itself in a tendency, if there is an absence of genital satisfaction or if there are difficulties in the real external world, for the libido to hark back to its earlier pregenital cathexes (*regression*).

During the study of the sexual functions we have been able to gain a first, preliminary conviction, or rather a suspicion, of two discoveries which will later be found to be important over the whole of our field. Firstly, the normal and abnormal manifestations observed by us (that is, the phenomenology of the subject) need to be described from the point of view of their dynamics and economics (in our case, from the point of view of the quantitative distribution of the libido). And secondly, the aetiology of the disorders which we study is to be looked for in the individual's developmental history – that is to say, in his early life.

CHAPTER IV
PSYCHICAL QUALITIES

[157] I have described the structure [*Bau*][T] of the psychical apparatus and the energies or forces which are active in it, and I have traced in a prominent example the way in which those energies (in the main, the libido) organize themselves into a physiological function which serves the purpose of the preservation of the species. There was nothing in all this to demonstrate the quite peculiar characteristic of what is psychical, apart, of course, from the empirical fact that this apparatus and these energies are the basis of the functions which we describe as our mental life. I will now turn to something which is uniquely characteristic of what is psychical, and which, indeed, according to a very widely held opinion, coincides with it to the exclusion of all else.

The starting point for this investigation is provided by a fact without parallel, which defies all explanation or description – the fact of consciousness. Nevertheless, if anyone speaks of consciousness we know immediately and from our most personal experience what is meant by it.[1] Many people, both inside and outside science, are satisfied with the assumption that consciousness alone is psychical; in that case nothing remains for psychology but to discriminate among psychical phenomena between perceptions, feelings, thought processes and volitions. It is generally agreed, however, that these conscious processes do not form unbroken sequences which are complete in themselves; there would thus be no alternative left to assuming that there are physical or somatic processes which are concomitant with the psychical ones and which we should necessarily have to recognize as more complete than the psychical sequences, since some of them would have conscious processes parallel to them but others would not. If so, it of course becomes plausible to lay the stress in psychology on these somatic processes, to see in *them* the true essence of what is psychical and to look for some other
[158] assessment of the conscious processes. The majority of philosophers, however, as well as many other people, dispute this and declare that the idea of something psychical being unconscious is self-contradictory.

But that is precisely what psychoanalysis is obliged to assert, and this is its second fundamental hypothesis [p. 131 f. above]. It explains the

1 One extreme line of thought, exemplified in the American doctrine of behaviourism, thinks it possible to construct a psychology which disregards this fundamental fact!

supposedly somatic concomitant phenomena as being what is truly psychical, and thus in the first instance disregards the quality of consciousness. It is not alone in doing this. Some thinkers (such as Theodor Lipps,[1] for instance) have asserted the same thing in the same words; and the general dissatisfaction with the usual view of what is psychical has resulted in an increasingly urgent demand for the inclusion in psychological thought of a concept of the unconscious, though this demand has taken such an indefinite and obscure form that it could have no influence on science.[2]

Now it would look as though this dispute between psychoanalysis and philosophy is concerned only with a trifling matter of definition – the question whether the name 'psychical' should be applied to one or another sequence of phenomena. In fact, however, this step has become of the highest significance. Whereas the psychology of consciousness never went beyond the broken sequences which were obviously dependent on something else, the other view, which held that the psychical is unconscious in itself, enabled psychology to take its place as a natural science like any other. The processes with which it is concerned are in themselves just as unknowable as those dealt with by other sciences, by chemistry or physics, for example; but it is possible to establish the laws which they obey and to follow their mutual relations and interdependences unbroken over long stretches – in short, to arrive at what is described as an 'understanding' of the field of natural phenomena in question. This cannot be effected without framing fresh hypotheses and creating fresh concepts; but these are not to be despised as evidence of embarrassment on our part but deserve on the contrary to be appreciated as an enrichment of science. They can lay claim to the same value as [159]
approximations that belongs to the corresponding intellectual scaffolding found in other natural sciences, and we look forward to their being modified, corrected and more precisely determined as further experience is accumulated and sifted. So too it will be entirely in accordance with our expectations if the basic concepts and principles of the new science (drive, nervous energy, etc.) remain for a considerable time no less indeterminate than those of the older sciences (force, mass, attraction, etc.).

Every science is based on observations and experiences arrived at through the medium of our psychical apparatus. But since *our* science

1 [Some account of Lipps (1851–1914) and Freud's relations with him is given in the Editors' Preface to Freud's book on *Jokes* (1905*c*), *RSE*, **8**, 4.]

2 [When this work was first published in 1940, a long footnote was inserted at this point in the German version. See the Editors' Note, p. 127 above.]

has as its subject that apparatus itself, the analogy ends here. We make our observations through the medium of the same perceptual apparatus, precisely with the help of the breaks in the sequence of 'psychical' events: we fill in what is omitted by making plausible inferences and translating [*übersetzen*][T] it into conscious material. In this way we construct, as it were, a sequence of conscious events complementary to the unconscious psychical processes. The relative certainty of our psychical science is based on the binding force of these inferences. Anyone who enters deeply into our work will find that our technique holds its ground against any criticism.

Übersetzung

In the course of this work the distinctions which we describe as psychical qualities force themselves on our notice. There is no need to characterize what we call 'conscious': it is the same as the consciousness of philosophers and of everyday opinion. Everything else psychical is in our view 'the unconscious'. We are soon led to make an important division in this unconscious. Some processes become conscious easily; they may then cease to be conscious, but can become conscious once more without any trouble: as people say, they can be reproduced or remembered. This reminds us that consciousness is in general a highly fugitive state. What is conscious is conscious only for a moment. If our perceptions do not confirm this, the contradiction is only an apparent one; it is explained by the fact that the stimuli which lead to perception may persist for considerable periods, so that meanwhile the perception of them may be repeated. The whole position is made clear in connection with the conscious perception of our thought processes: these too may persist for some time, but they may just as well pass in a flash. Everything unconscious that behaves in this way, that can thus easily exchange the unconscious state for the conscious one, is therefore preferably described as 'capable of becoming conscious' or as *preconscious*. Experience has taught us that there is hardly a psychical process, however complicated it may be, which cannot on occasion remain preconscious, even though as a rule it will, as we say, push its way forward into consciousness. There are other psychical processes and psychical material which have no such easy access to becoming conscious but must be inferred, recognized and translated into conscious form in the manner described. For such material we reserve the name of the unconscious proper.

[160]

Thus we have attributed three qualities to psychical processes: they are either conscious, preconscious or unconscious. The division between the three classes of material which possess these qualities is neither

absolute nor permanent. What is preconscious becomes conscious, as we have seen, without any assistance from us; what is unconscious can, through our efforts, be made conscious, and in the process we may have a feeling that we are often overcoming very strong resistances. When we attempt to do this with someone else, we should not forget that the conscious filling in of the gaps in his perceptions – the construction we are presenting him with – does not mean as yet that we have made the unconscious material in question conscious to him. All that is true so far is that the material is present in him in two records,[1] once in the conscious reconstruction he has been given, and besides this in its original unconscious state. Our continued efforts usually succeed eventually in making this unconscious material conscious to him himself, as a result of which the two records are brought to coincide. The amount of effort we have to use, by which we estimate the resistance against the material becoming conscious, varies in magnitude in individual cases. For instance, what comes about in an analytic treatment as a result of our efforts can also occur spontaneously: material which is ordinarily uncon- [161]
scious can transform itself into preconscious material and then becomes conscious – a thing that happens to a large extent in psychotic states. From this we infer that the maintenance of certain internal resistances is a *sine qua non* of normality. A relaxation of resistances such as this, with a consequent pushing forward of unconscious material, takes place regularly in the state of sleep, and thus brings about a necessary precondition for the construction of dreams. Conversely, preconscious material can become temporarily inaccessible and cut off by resistances, as happens when something is temporarily forgotten or escapes the memory; or a preconscious thought can even be temporarily put back into the unconscious state, as seems to be a precondition in the case of jokes. We shall see that a similar transformation back of preconscious material or processes into the unconscious state plays a great part in the causation of neurotic disorders.

The theory of the three qualities of what is psychical, as described in this generalized and simplified manner, seems likely to be a source of limitless confusion rather than a help towards clarification. But it should not be forgotten that in fact it is not a theory at all but a first

1 [The German word translated by 'record' here is '*Fixierung*' used in exactly this sense in Chapter VII (B) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 481–2. Elsewhere Freud uses the term '*Niederschrift*' – e.g. in 'The Unconscious' (1915*e*), ibid., **14**, 154, and as early as in a letter to Fliess, of December 6, 1896 (Freud, 1950*a*, Letter 52) – which is translated in the *RSE* by 'registration'. It may be remarked that in *Moses and Monotheism* (1939*a*), which Freud had recently completed, he several times used the word '*Fixierung*' to describe the recording of a tradition. See, for example, p. 57 above.]

stocktaking of the facts of our observations, that it keeps as close to those facts as possible and does not attempt to explain them. The complications which it reveals may bring into relief the peculiar difficulties with which our investigations have to contend. It may be suspected, however, that we shall come to a closer understanding of this theory itself if we trace out the relations between the psychical qualities and the provinces or agencies of the psychical apparatus which we have postulated – though these relations too are far from being simple.

The process of something becoming conscious is above all linked with the perceptions which our sense organs receive from the external world. From the topographical point of view, therefore, it is a phenomenon which takes place in the outermost cortex of the ego. It is true that we also receive conscious information from the inside of the body – the feelings, which actually exercise a more peremptory influence on our mental life than external perceptions; moreover, in certain circumstances the sense organs themselves transmit feelings, sensations of pain, in addition to the perceptions specific to them. Since, however, [162] these sensations (as we call them in contrast to conscious perceptions) also emanate from the terminal organs and since we regard all these as prolongations or offshoots of the cortical layer, we are still able to maintain the assertion made above [at the beginning of this paragraph]. The only distinction would be that, as regards the terminal organs of sensation and feeling, the body itself would take the place of the external world.[1]

Conscious processes on the periphery of the ego and everything else in the ego unconscious – such would be the simplest state of affairs that we might picture. And such may in fact be the state that prevails in animals. But in men there is an added complication through which internal processes in the ego may also acquire the quality of consciousness. This is the work of the function of language, which brings material in the ego into a firm connection with mnemic residues of visual, but more particularly of auditory, perceptions. Thenceforward the perceptual periphery of the cortical layer can be excited to a much greater extent from inside as well, internal events such as passages of ideas and thought processes can become conscious, and a special device is called for in order to distinguish between the two possibilities – a device known as *reality-testing*. The equation 'perception = reality (external world)' no longer holds. Errors, which can now easily arise and do so regularly in dreams, are called *hallucinations*.

1 [Cf. p. 179 *n*. 1 below.]

The inside of the ego, which comprises above all the thought processes, has the quality of being preconscious. This is characteristic of the ego and belongs to it alone. It would not be correct, however, to think that connection with the mnemic residues of speech is a necessary precondition of the preconscious state. On the contrary, that state is independent of a connection with them, though the presence of that connection makes it safe to infer the preconscious nature of a process. The preconscious state, characterized on the one hand by having access to consciousness and on the other hand by its connection with the speech residues, is nevertheless something peculiar, the nature of which is not exhausted by these two characteristics. The evidence for this is the fact that large portions of the ego, and particularly of the superego, which cannot be denied the characteristic of preconsciousness, nonetheless remain for the most part unconscious in the phenomenological sense of the word. We do not know why this must be so. We shall attempt presently to attack the problem of the true nature of the preconscious. [163]

The sole prevailing quality in the id is that of being unconscious. Id and unconscious are as intimately linked as ego and preconscious: indeed, in the former case the connection is even more exclusive. If we look back at the developmental history of an individual and of his psychical apparatus, we shall be able to perceive an important distinction in the id. Originally, to be sure, everything was id; the ego was developed out of the id by the continual influence of the external world. In the course of this slow development certain of the contents of the id were transformed into the preconscious state and so taken into the ego; others of its contents remained in the id unchanged, as its scarcely accessible nucleus. During this development, however, the young and feeble ego put back into the unconscious state some of the material it had already taken in, dropped it, and behaved in the same way to some fresh impressions which it *might* have taken in, so that these, having been rejected, could leave a trace only in the id. In consideration of its origin we speak of this latter portion of the id as *the repressed*. It is of little importance that we are not always able to draw a sharp line between these two categories of contents in the id. They coincide approximately with the distinction between what was innately present originally and what was acquired in the course of the ego's development.

Having now decided upon the topographical dissection of the psychical apparatus into an ego and an id, with which the difference in quality between preconscious and unconscious runs parallel, and having agreed that this quality is to be regarded only as an *indication* of the difference

and not as its essence, a further question faces us. What, if this is so, is the true nature of the state which is revealed in the id by the quality of being unconscious and in the ego by that of being preconscious and in what does the difference between them consist?

But of that we know nothing. And the profound obscurity of the background of our ignorance is scarcely illuminated by a few glimmers of insight. Here we have approached the still shrouded secret of the nature of the psychical. We assume, as other natural sciences have led us to expect, that in mental life some kind of energy is at work; but we have nothing to go upon which will enable us to come nearer to a knowledge
[164] of it by analogies with other forms of energy. We seem to recognize that nervous or psychical energy occurs in two forms, one freely mobile and another, by comparison, bound; we speak of cathexes and hypercathexes of psychical material, and even venture to suppose that a hypercathexis brings about a kind of synthesis of different processes – a synthesis in the course of which free energy is transformed into bound energy. Further than this we have not advanced. At any rate, we hold firmly to the view that the distinction between the unconscious and the preconscious state lies in dynamic relations of this kind, which would explain how it is that, whether spontaneously or with our assistance, the one can be changed into the other.

Behind all these uncertainties, however, there lies one new fact, whose discovery we owe to psychoanalytic research. We have found that processes in the unconscious or in the id obey different laws from those in the preconscious ego. We name these laws in their totality the *primary process*, in contrast to the *secondary process* which governs the course of events in the preconscious, in the ego. In the end, therefore, the study of psychical qualities has after all proved not unfruitful.

CHAPTER V
DREAM INTERPRETATION AS AN ILLUSTRATION

An investigation of normal, stable states, in which the frontiers of the ego [165]
are safeguarded against the id by resistances (anticathexes) and have held firm, and in which the superego is not distinguished from the ego, because they work together harmoniously – an investigation of that kind would teach us little. The only thing that can help us are states of conflict and uproar, when the contents of the unconscious id have a prospect of forcing their way into the ego and into consciousness and the ego puts itself once more on the defensive against this invasion. It is only under these conditions that we can make such observations as will confirm or correct our statements about the two partners. Now, our nightly sleep is precisely a state of this sort, and for that reason psychical activity during sleep, which we perceive as dreams, is our most favourable object of study. In that way, too, we avoid the familiar reproach that we base our constructions of normal mental life on pathological findings; for dreams are regular events in the life of a normal person, however much their characteristics may differ from the productions of our waking life. Dreams, as everyone knows, may be confused, unintelligible or positively nonsensical, what they say may contradict all that we know of reality, and we behave in them like insane people, since, so long as we are dreaming, we attribute objective reality to the contents of the dream.

We find our way to the understanding ('interpretation' ['*Deutung*'][T]) of a dream by assuming that what we recollect as the dream after we have woken up is not the true dream process but only a *façade* behind which that process lies concealed. Here we have our distinction between the *manifest* content of a dream and the *latent* dream thoughts. The process which produces the former out of the latter is described as the *dream-work*. The study of the dream-work teaches us by an excellent example the way in which unconscious material from the id (originally unconscious and repressed unconscious alike) forces its way into the ego, becomes preconscious and, as a result of the ego's opposition, undergoes the changes which we know as *dream distortion*. There are no features of [166]
a dream which cannot be explained in this way.

It is best to begin by pointing out that the formation of a dream can be provoked in two different ways. Either, on the one hand, a drive impulse

which is ordinarily suppressed (an unconscious wish) finds enough strength during sleep to make itself felt by the ego, or, on the other hand, an urge left over from waking life, a preconscious train of thought with all the conflicting impulses attached to it, finds reinforcement during sleep from an unconscious element. In short, dreams may arise either from the id or from the ego. The mechanism of dream formation is in both cases the same and so also is the necessary dynamic precondition. The ego gives evidence of its original derivation from the id by occasionally ceasing its functions and allowing a reversion to an earlier state of things. This is logically brought about by its breaking off its relations with the external world and withdrawing its cathexes from the sense organs. We are justified in saying that there arises at birth a drive to return to the intrauterine life that has been abandoned – a drive to sleep. Sleep is a return of this kind to the womb. Since the waking ego governs motility, that function is paralysed in sleep, and accordingly a good part of the inhibitions imposed on the unconscious id become superfluous. The withdrawal or reduction of these 'anticathexes' thus allows the id what is now a harmless amount of liberty.

The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (*a*) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (*b*) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of language. (*c*) Memory very often reproduces in dreams impressions from the dreamer's early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help – usually indispensable – given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer's early life. (*d*) Furthermore, dreams
[167] bring to light material which cannot have originated either from the dreamer's adult life or from his forgotten childhood. We are obliged to regard it as part of the *archaic heritage* which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.

But what makes dreams so invaluable in giving us insight is the circumstance that, when the unconscious material makes its way into the ego, it brings its own modes of working along with it. This means that the preconscious thoughts in which the unconscious material has found its expression are handled in the course of the dream-work as though they were unconscious portions of the id; and, in the case of the alternative method of dream formation, the preconscious thoughts which have obtained reinforcement from an unconscious drive impulse are brought down to the unconscious state. It is only in this way that we learn the laws which govern the passage of events in the unconscious and the respects in which they differ from the rules that are familiar to us in waking thought. Thus the dream-work is essentially an instance of the unconscious working over of preconscious thought processes. To take an analogy from history: invading conquerors govern a conquered country, not according to the judicial system which they find in force there, but according to their own. It is, however, an unmistakable fact that the outcome of the dream-work is a compromise. The ego organization is not yet paralysed, and its influence is to be seen in the distortion imposed on the unconscious material and in what are often very ineffective attempts at giving the total result a form not too unacceptable to the ego (*secondary revision*). In our analogy this would be an expression of the continued resistance of the defeated people.

The laws that govern the passage of events in the unconscious, which come to light in this manner, are remarkable enough and suffice to explain most of what seems strange to us about dreams. Above all there is a striking tendency to *condensation* [*Verdichtung*][T], an inclination to form fresh unities out of elements which in our waking thought we should certainly have kept separate. As a consequence of this, a single element of the manifest dream often stands for a whole number of latent dream thoughts as though it were a combined allusion to all of them; and [168]
in general the compass of the manifest dream is extraordinarily small in comparison with the wealth of material from which it has sprung. Another peculiarity of the dream-work, not entirely independent of the former one, is the ease with which psychical intensities[1] (cathexes) are *displaced* from one element to another, so that it often happens that an element which was of little importance in the dream thoughts appears as the clearest and accordingly most important feature of the manifest dream, and, *vice versa*, that essential elements of the dream thoughts are represented in the manifest dream only by slight allusions. Moreover, as

1 [A term very often used by Freud from the earliest times as an equivalent to psychical energy. See the Editors' Appendix to the first paper on the neuropsychoses of defence (1894*a*), *RSE*, **3**, 60; also an Editors' footnote near the end of the paper on 'Female Sexuality' (1931*b*), ibid., **21**, 231 *n*.]

a rule the existence of quite insignificant points in common between two elements is enough to allow the dream-work to replace one with the other in all further operations. It will easily be imagined how greatly these mechanisms of condensation and displacement can increase the difficulty of interpreting a dream and of revealing the relations between the manifest dream and the latent dream thoughts. From the evidence of the existence of these two tendencies to condensation and displacement our theory infers that in the unconscious id the energy is in a freely mobile state and that the id sets more store by the possibility of discharging [*Abfuhr*][T] quantities of excitation than by any other consideration;[I] and our theory makes use of these two peculiarities in defining the character of the primary process we have attributed to the id.

abführen

The study of the dream-work has taught us many other characteristics of the processes in the unconscious which are as remarkable as they are important; but we must mention only a few of them here. The governing rules of logic carry no weight in the unconscious; it might be called the Realm of the Illogical. Urges with contrary aims exist side by side in the unconscious without any need arising for an adjustment between them. Either they have no influence whatever on each other, or, if they have, no decision is reached, but a compromise comes about which is nonsensical since it embraces mutually incompatible details. With this is connected the fact that contraries are not kept apart but treated as though they were identical, so that in the manifest dream any element may also have the meaning of its opposite. Certain philologists have found that the same held good in the most ancient languages and that contraries such as 'strong–weak', 'light–dark' and 'high–deep' were originally expressed by the same roots, until two different modifications of the primitive word distinguished between the two meanings. Residues of this original double meaning seem to have survived even in a highly developed language like Latin in its use of words such as '*altus*' ('high' and 'deep') and '*sacer*' ('sacred' and 'infamous'). [Cf. p. 110 above.]

[169]

In view of the complication and ambiguity of the relations between the manifest dream and the latent content lying behind it, it is of course justifiable to ask how it is at all possible to deduce the one from the other and whether all we have to go on is a lucky guess, assisted perhaps by a translation of the symbols that occur in the manifest dream. It may be

1 An analogy may be seen in the behaviour of a non-commissioned officer who accepts a reprimand from his superior in silence but vents his anger on the first innocent private he comes across. [In this insistence by the id on discharging quantities of excitation we have an exact replica of what Freud in his 'Project' of 1895 (Part I, Section 1) had described in quasi-neurological terms as the primary principle of neuronal activity: 'neurons tend to divest themselves of Q'. (1950*a*; *RSE*, **1**, 320.)]

said in reply that in the great majority of cases the problem can be satisfactorily solved, but only with the help of the associations [*Assoziationen*][T] provided by the dreamer himself to the elements of the manifest content. Any other procedure is arbitrary and can yield no certain result. But the dreamer's associations bring to light intermediate links which we can insert in the gap between the two [between the manifest and latent content] and by aid of which we can reinstate the latent content of the dream and 'interpret' it. It is not to be wondered at if this work of interpretation (acting in a direction opposite to the dream-work) fails occasionally to arrive at complete certainty.

It remains for us to give a dynamic explanation of why the sleeping ego takes on the task of the dream-work at all. The explanation is fortunately easy to find. With the help of the unconscious, every dream that is in process of formation makes a demand upon the ego – for the satisfaction of a drive, if the dream originates from the id; for the solution to a conflict, the removal of a doubt or the forming of an intention, if the dream [170] originates from a residue of preconscious activity in waking life. The sleeping ego, however, is focused on the wish to maintain sleep; it feels this demand as a disturbance and seeks to get rid of the disturbance. The ego succeeds in doing this by what appears to be an act of compliance: it meets the demand with what is in the circumstances a harmless *fulfilment of a wish* and so gets rid of it. This replacement of the demand by the fulfilment of a wish remains the essential function of the dream-work. It may perhaps be worthwhile to illustrate this by three simple examples – a hunger dream, a dream of convenience and a dream prompted by sexual desire. A need for food makes itself felt in a dreamer during his sleep: he has a dream of a delicious meal and sleeps on. The choice, of course, was open to him either of waking up and eating something or of continuing his sleep. He decided in favour of the latter and satisfied his hunger by means of the dream – for the time being, at all events, for if his hunger had persisted he would have had to wake up nevertheless. Here is the second example. A sleeper had to wake up so as to be in time for his work at the hospital. But he slept on, and had a dream that he was already at the hospital – but as a patient, who has no need to get up. Or again, a desire becomes active during the night for the enjoyment of a forbidden sexual object, the wife of a friend of the sleeper. He has a dream of sexual intercourse – not, indeed, with this person but with someone else of the same name to whom he is in fact indifferent; or his struggle against the desire may find expression in his mistress remaining altogether anonymous.

Naturally, every case is not so simple. Especially in dreams which have originated from undealt-with residues of the previous day, and which have obtained only an unconscious reinforcement during the state of sleep, it is often no easy task to uncover the unconscious driving force [*Triebkraft*] and its wish fulfilment; but we may assume that it is always there. The thesis that dreams are the fulfilments of wishes will easily arouse scepticism when it is remembered how many dreams have an actually distressing content or even wake the dreamer in anxiety, quite apart from the numerous dreams without any definite feeling-tone. But the objection based on anxiety dreams cannot be sustained against analysis. It must not be forgotten that dreams are invariably the product of a conflict, that they are a kind of compromise structure. Something that is [171] a satisfaction for the unconscious id may for that very reason be a cause of anxiety for the ego.

As the dream-work proceeds, sometimes the unconscious will press forward more successfully and sometimes the ego will defend itself with greater energy. Anxiety dreams are mostly those whose content has undergone the least distortion. If the demand made by the unconscious is too great for the sleeping ego to be in a position to fend it off [*abzuwehren*][T] by the means at its disposal, it abandons the wish to sleep *Abwehr* and returns to waking life. We shall be taking every experience into account if we say that a dream is invariably an *attempt* to get rid of a disturbance of sleep by means of a wish fulfilment, so that the dream is a guardian of sleep. The attempt may succeed more or less completely; it may also fail, and in that case the sleeper wakes up, apparently woken precisely by the dream. So, too, there are occasions when that excellent fellow the night-watchman, whose business it is to guard the little township's sleep, has no alternative but to sound the alarm and waken the sleeping townspeople.

I will close this discussion with a comment which will justify the length of time I have spent on the problem of the interpretation of dreams. Experience has shown that the unconscious mechanisms which we have come to know from our study of the dream-work and which gave us the explanation of the formation of dreams also help us to understand the puzzling symptoms which attract our interest to neuroses and psychoses. A conformity of such a kind cannot fail to excite high hopes in us.

PART II
THE PRACTICAL TASK

CHAPTER VI
THE TECHNIQUE OF PSYCHOANALYSIS

A dream, then, is a psychosis, with all the absurdities, delusions and illusions of a psychosis. A psychosis of short duration, no doubt, harmless, even entrusted with a useful function, introduced with the subject's consent and terminated by an act of his will. Nonetheless it is a psychosis, and we learn from it that even so deep-going an alteration of mental life as this can be undone and can give place to the normal function. Is it too bold, then, to hope that it must also be possible to submit the dreaded spontaneous illnesses of mental life to our influence and bring about their cure? [172]

We already know a number of things preliminary to such an undertaking. According to our hypothesis it is the ego's task to meet the demands raised by its three dependent relations – to reality, to the id and to the superego – and nevertheless at the same time to preserve its own organization and maintain its own autonomy. The necessary precondition of the pathological states under discussion can only be a relative or absolute weakening of the ego which makes the fulfilment of its tasks impossible. The severest demand on the ego is probably the keeping down of the drive demands of the id, to accomplish which it is obliged to maintain large expenditures of energy on anticathexes. But the demands made by the superego too may become so powerful and so relentless that the ego may be paralysed, as it were, in the face of its other tasks. We may suspect that, in the economic conflicts which arise at this point, the id and the superego often make common cause against the hard-pressed ego which tries to cling to reality in order to retain its normal state. If the other two become too strong, they succeed in loosening and altering the ego's organization, so that its proper relation to reality is disturbed or even brought to an end. We have seen it happen in dreaming: when the ego is detached from the reality of the external world, it slips down, under the influence of the internal world, into psychosis. [173]

Our plan of cure is based on these discoveries. The ego is weakened by the internal conflict and we must go to its help. The position is like that in a civil war which has to be decided by the assistance of an ally from outside. The analytic physician and the patient's weakened ego, basing themselves on the real external world, have to band themselves together into a party against the enemies, the drive demands of the id and the conscientious demands of the superego. We form a pact with each other. The sick ego [*Das kranke Ich*][t] promises us the most complete candour – promises, that is, to put at our disposal all the material which its self-perception yields it; we assure the patient of the strictest discretion and place at his service our experience in interpreting material that has been influenced by the unconscious. Our knowledge is to make up for his ignorance and to give his ego back its mastery over lost provinces of his mental life. This pact constitutes the analytic situation.

No sooner have we taken this step than a first disappointment awaits us, a first warning against overconfidence. If the patient's ego is to be a useful ally in our common work, it must, however hard it may be pressed by the hostile powers, have retained a certain amount of coherence and some fragment of understanding for the demands of reality. But this is not to be expected of the ego of a psychotic; it cannot observe a pact of this kind, indeed it can scarcely enter into one. It will very soon have tossed us away and the help we offer it and sent us to join the portions of the external world which no longer mean anything to it. Thus we discover that we must renounce the idea of trying our plan of cure upon psychotics – renounce it perhaps for ever or perhaps only for the time being, till we have found some other plan better adapted for them.

There is, however, another class of psychical patients who clearly resemble the psychotics very closely – the vast number of people suffering severely from neuroses. The determinants of their illness as well as its pathogenic mechanisms must be the same or at least very similar. But their ego has proved more resistant and has become less disorganized. Many of them, in spite of their maladies and the inadequacies resulting
[174] from them, have been able to maintain themselves in real life. These neurotics may show themselves ready to accept our help. We will confine our interest to *them* and see how far and by what methods we are able to 'cure' them.

With the neurotics, then, we make our pact: complete candour on one side and strict discretion on the other. This looks as though we were only aiming at the post of a secular father confessor. But there is a great

difference, for what we want to hear from our patient is not only what he knows and conceals from other people; he is to tell us too what he does *not* know. With this end in view we give him a more detailed definition of what we mean by candour. We pledge him to obey the *fundamental rule* of analysis, which is henceforward to govern his behaviour towards us. He is to tell us not only what he can say intentionally and willingly, what will give him relief like a confession, but everything else as well that his self-observation yields him, everything that comes into his head, even if it is *disagreeable* for him to say it, even if it seems to him *unimportant* or actually *nonsensical*. If he can succeed after this injunction in putting his self-criticism out of action, he will present us with a mass of material – thoughts, ideas [*Einfällen*], recollections – which are already subject to the influence of the unconscious, which are often its direct derivatives, and which thus put us in a position to conjecture his repressed unconscious material and to extend, by the information we give him, his ego's knowledge of his unconscious.

But it is far from being the case that his ego is content to play the part of passively and obediently bringing us the material we require and of believing and accepting our translation [*Übersetzung*] of it. A number of other things happen, a few of which we might have foreseen but others of which are bound to surprise us. The most remarkable thing is this. The patient is not satisfied with regarding the analyst in the light of reality as a helper and adviser who, moreover, is remunerated for the trouble he takes and who would himself be content with some such role as that of a guide on a difficult mountain climb. On the contrary, the patient sees in him the return, the reincarnation, of some important figure out of his childhood or past, and consequently transfers on to him feelings and reactions which undoubtedly applied to this prototype. This fact of transference [*Übertragung*][T] soon proves to be a factor of undreamt-of importance, on the one hand an instrument of irreplaceable value and on the other hand a source of serious dangers. This [175]
transference is *ambivalent*: it comprises positive (affectionate) as well as negative (hostile) attitudes towards the analyst, who as a rule is put in the place of one or other of the patient's parents, his father or mother. So long as it is positive it serves us admirably. It alters the whole analytic situation; it pushes to one side the patient's rational aim of becoming healthy and free from his ailments. Instead of it there emerges the aim of pleasing the analyst and of winning his applause and love. It becomes the true driver [*Triebfeder*] of the patient's collaboration; his weak ego becomes strong; under its influence he achieves things that would

ordinarily be beyond his power; he leaves off his symptoms and seems apparently to have recovered – merely for the sake of the analyst. The analyst may shamefacedly admit to himself that he set out on a difficult undertaking without any suspicion of the extraordinary powers that would be at his command.

Moreover, the relation of transference brings with it two further advantages. If the patient puts the analyst in the place of his father (or mother), he is also giving him the power which his superego exercises over his ego, since his parents were, as we know, the origin of his superego. The new superego now has an opportunity for a sort of *after-education* [*Nacherziehung*] of the neurotic; it can correct mistakes for which his parents were responsible in raising [*Erziehung*][T] him. But at this point a warning must be given against misusing this new influence. However much the analyst may be tempted to become a teacher, model and ideal for other people and to create men in his own image, he should not forget that that is not his task in the analytic relationship, and indeed that he will be disloyal to his task if he allows himself to be led on by his inclinations. If he does, he will only be repeating a mistake of the parents who crushed their child's independence by their influence, and he will only be replacing the patient's earlier dependence with a new one. In all his attempts at improving and educating the patient the analyst should respect his individuality. The amount of influence which he may legitimately allow himself will be determined by the degree of developmental inhibition present in the patient. Some neurotics have remained so infantile that in analysis too they can only be treated as children.

[176] Another advantage of transference, too, is that in it the patient produces before us with plastic clarity an important part of his life story, of which he would otherwise have probably given us only an insufficient *Agieren* account. He acts [*agiert*][T] it before us, as it were, instead of reporting it to us.

And now for the other side of the situation. Since the transference reproduces the patient's relation with his parents, it takes over the ambivalence of that relation as well. It almost inevitably happens that one day his positive attitude towards the analyst changes over into the negative, hostile one. This too is as a rule a repetition of the past. His obedience to his father (if it is his father that is in question), his courting of his father's favour, had its roots in an erotic wish directed towards him. Some time or other that demand will press its way forward in the transference as well and insist on being satisfied. In the

analytic situation it can only meet with frustration [*Versagung*][T]. Real sexual relations between patients and analysts are out of the question, and even the subtler methods of satisfaction, such as the giving of preference, intimacy and so on, are granted only sparingly by the analyst. A rejection of this kind is taken as the occasion for the change-over; probably things happened in the same way in the patient's childhood.

The therapeutic successes that occurred under the sway of the positive transference are open to the suspicion of being of a *suggestive* nature. If the negative transference gains the upper hand, they are blown away like chaff before the wind. We observe with horror that all our trouble and labour hitherto have been in vain. Indeed, what we might have regarded as a permanent intellectual gain by the patient, his understanding of psychoanalysis and his reliance on its efficacy, suddenly vanish. He behaves like a child who has no power of judgement of his own but blindly believes anyone whom he loves and no-one who is a stranger to him. The danger of these states of transference evidently lies in the patient's misunderstanding their nature and taking them for fresh real experiences instead of reflections of the past. If he (or she) becomes aware of the strong erotic desire that lies concealed behind the positive transference, he believes that he has fallen passionately in love; if the transference changes over, then he feels insulted and neglected, he hates the analyst as his enemy and is ready to abandon the analysis. In both these extreme cases he has forgotten the pact that he made at the beginning of the treatment and has become [177]
useless for continuing the common work. It is the analyst's task constantly to tear the patient out of his menacing illusion and to show him again and again that what he takes to be new real life is a reflection of the past. And lest he should fall into a state in which he is inaccessible to all evidence, the analyst takes care that neither the love nor the hostility reaches an extreme height. This is effected by preparing him in good time for these possibilities and by not overlooking the first signs of them. Careful handling of the transference on these lines is as a rule richly rewarded. If we succeed, as we usually can, in enlightening the patient on the true nature of the phenomena of transference, we shall have struck a powerful weapon out of the hand of his resistance and shall have converted dangers into gains. For a patient never forgets again what he has experienced in the form of transference; it carries a greater force of conviction than anything he can acquire in other ways.

We think it most undesirable if the patient *acts* outside [*agiert*] the transference instead of remembering. The ideal conduct for our purposes would be that he should behave as normally as possible outside the treatment and express his abnormal reactions only in the transference.

The method by which we strengthen the weakened ego has as a starting point an extending of its self-knowledge. That is not, of course, the whole story but it is a first step. The loss of such knowledge signifies for the ego a surrender of power and influence; it is the first tangible sign that it is being hemmed in and hampered by the demands of the id and the superego. Accordingly, the first part of the help we have to offer is intellectual work on our side and encouragement to the patient to collaborate in it. This first kind of activity, as we know, is intended to pave the way to another, more difficult, task. We shall not lose sight of the dynamic element in this task, even during its preliminary stage. We gather the material for our work from a variety of sources – from what is conveyed to us by the information given us by the patient and by his free associations [*freien Assoziationen*], from what he shows us in his transferences, from what we arrive at by interpreting his dreams and from what he betrays by his *parapraxes* [*Fehlleistungen*][T]. All this material helps us to make constructions about what happened to him and has
[178] been forgotten as well as about what is happening in him now without his understanding it. But in all this we never fail to make a strict distinction between *our* knowledge and *his* knowledge. We avoid telling him at once things that we have often discovered at an early stage, and we avoid telling him the whole of what we think we have discovered. We reflect carefully over when we shall impart the knowledge of one of our constructions to him and we wait for what seems to us the suitable moment – which it is not always easy to decide. As a rule we put off telling him of a construction or explanation till he himself has so nearly arrived at it that only a single step remains to be taken, though that step is in fact the decisive synthesis. If we proceeded in another way and overwhelmed him with our interpretations before he was prepared for them, our information would either produce no effect or it would provoke a violent outbreak of *resistance* which would make the progress of our work more difficult or might even threaten to stop it altogether. But if we have prepared everything properly, it often happens that the patient will at once confirm our construction and himself recollect the internal or external event which he had forgotten. The more exactly the construction coincides with the details of what has been forgotten

the easier will it be for him to assent. On that particular matter *our* knowledge will then have become *his* knowledge as well.

With the mention of resistance we have reached the second and more important part of our task. We have already learnt that the ego protects itself against the invasion of undesired elements from the unconscious and repressed id by means of anticathexes [*Gegenbesetzungen*], which must remain intact if it is to function normally. The more hard-pressed the ego feels, the more convulsively it clings (as though in a fright [*verängstigt*]) to these anticathexes, in order to protect what remains of itself from further irruptions. But this defensive purpose does not by any means accord with the aims of our treatment. What we desire, on the contrary, is that the ego, emboldened by the certainty of our help, shall dare to take the offensive in order to reconquer what has been lost. And it is here that we become aware of the strength of these anticathexes in the form of *resistances* to our work. The ego draws back in alarm from such undertakings, which seem dangerous and threaten unpleasure; it must be constantly encouraged and soothed if it is not to fail us. This resistance, which persists throughout the whole treatment and is renewed at every fresh piece of work, is known, not quite correctly, as the *resistance due to repression*. We shall find that it is not the only one that faces us. It is interesting to notice that in this situation the party divisions are to some extent reversed: for the ego struggles against our instigation, while the unconscious, which is ordinarily our opponent, comes to our help, since it has a natural 'upward drive' [*Auftrieb*] and desires nothing better than to press forward across its settled frontiers into the ego and so to consciousness. The struggle which develops, if we gain our end and can induce the ego to overcome its resistances, is carried through under our direction and with our assistance. Its outcome is a matter of indifference: whether it results in the ego accepting, after a fresh examination, a drive demand which it has hitherto rejected, or whether it dismisses it once more, this time for good and all. In either case a permanent danger has been disposed of, the compass of the ego has been extended and a wasteful expenditure of energy has been made unnecessary. [179]

The overcoming of resistances is the part of our work that requires the most time and the greatest trouble. It is worthwhile, however, for it brings about an advantageous alteration of the ego which will be maintained independently of the outcome of the transference and will hold good in life. We have also worked simultaneously at getting rid of

the alteration of the ego which had been brought about under the influence of the unconscious; for whenever we have been able to detect any of its derivatives in the ego we have pointed out their illegitimate origin and have instigated the ego to reject them. It will be remembered that it was one of the necessary preconditions of our pact of assistance that any such alteration of the ego due to the intrusion of unconscious elements should not have gone beyond a certain amount.

The further our work proceeds and the more deeply our insight penetrates into the mental life of neurotics, the more clearly two new factors force themselves on our notice, which demand the closest attention as sources of resistance. Both of them are completely unknown to the patient, neither of them could be taken into account when our pact was made; nor do they arise from the patient's ego. They may both be embraced under the single name of 'need to be ill or to suffer', but they have different origins, though in other respects they are of a kindred
[180] nature. The first of these two factors is the sense of guilt or consciousness of guilt [*Schuldbewusstsein*], as it is called, though the patient does not feel it and is not aware of it. It is evidently the portion of the resistance contributed by a superego that has become particularly severe and cruel. The patient must not become well but must remain ill, for he deserves no better. This resistance does not actually interfere with our intellectual work, but it makes it inoperative; indeed, it often allows us to remove one form of neurotic suffering, but is ready at once to replace it with another, or perhaps with some somatic illness. The sense of guilt also explains the cure or improvement of severe neuroses which we occasionally observe after real misfortunes: all that matters is that the patient should be miserable – in what way is of no consequence. The uncomplaining resignation with which such people often put up with their hard fate is most remarkable, but also revealing. In warding off [*Abwehr*] this resistance we are obliged to restrict ourselves to making it conscious and attempting to bring about the slow demolition of the hostile superego.

It is less easy to demonstrate the existence of another resistance, our means of combating which are specially inadequate. There are some neurotics in whom, to judge by all their reactions, the drive to self-preservation [*Selbsterhaltung*] has actually been reversed. They seem to aim at nothing other than self-injury and self-destruction. It is possible too that the people who in fact do in the end commit suicide belong to this group. It is to be assumed that in such people far-reaching defusions of drive have taken place, as a result of which there has been a

liberation of excessive quantities of the destructive drive directed inwards. Patients of this kind are not able to tolerate recovery through our treatment and fight against it with all their strength. But we must confess that this is a case which we have not yet succeeded in completely explaining.

Let us once more glance over the situation which we have reached in our attempt at bringing help to the patient's neurotic ego. That ego is no longer able to fulfil the task set it by the external world (including human society). Not all of its experiences are at its disposal, a large proportion of its store of memories have escaped it. Its activity is inhibited by strict prohibitions from the superego, its energy is consumed in vain attempts at fending off [*Abwehr*] the demands of the id. Beyond this, as a result of continuous irruptions by the id, its organization is impaired, it is no longer capable of any proper synthesis, it is torn by [181] mutually opposed urges, by unsettled conflicts and by unsolved doubts. To start with, we get the patient's thus weakened ego to take part in the purely intellectual work of interpretation, which aims at provisionally filling the gaps in his mental assets, and to transfer to us the authority of his superego; we encourage it to take up the struggle over each individual demand made by the id and to conquer the resistances which arise in connection with it. At the same time we restore order in the ego by detecting the material and urges which have forced their way in from the unconscious, and expose them to criticism by tracing them back to their origin. We serve the patient in various functions, as an authority and a substitute for his parents, as a teacher and educator; and we have done the best for him if, as analysts, we raise the mental processes in his ego to a normal level, transform what has become unconscious and repressed into preconscious material and thus return it once more to the possession of his ego. On the patient's side a few rational factors work in our favour, such as the need for recovery which has its motive in his sufferings, and the intellectual interest that we may awaken in him in the theories and revelations of psychoanalysis; but of far greater force [*Kräften*] is the positive transference with which he meets us. Fighting against us, on the other hand, are the negative transference, the ego's resistance due to repression (that is, its unpleasure at having to lay itself open to the hard work imposed on it), the sense of guilt arising from its relation to the superego and the need to be ill due to deep-going changes in the economics of his[1] drives. The share taken by the last two factors

1 ['*seiner*.' This can be either 'its' or 'his'; it seems much more likely to refer to the person as a whole rather than to the ego.]

decides whether the case is to be regarded as slight or severe. Apart from these, a few other factors may be discerned as having a favourable or unfavourable bearing. A certain psychical inertia, a sluggishness of the libido, which is unwilling to abandon its fixations, cannot be welcome to us; the patient's capacity for sublimating his drives plays a large part and so does his capacity for rising above the crude life of the drives; so, too, does the relative power of his intellectual functions.

We shall not be disappointed, but, on the contrary, we shall find it entirely intelligible, if we reach the conclusion that the final outcome
[182] of the struggle we have engaged in depends on *quantitative* relations – on the quota of energy we are able to mobilize in the patient to our advantage as compared with the sum of energy of the powers working against us. Here once again God is on the side of the big battalions. It is true that we do not always succeed in winning, but at least we can usually recognize why we have not won. Those who have been following our discussion only out of therapeutic interest will perhaps turn away in contempt after this admission. But here we are concerned with therapy only insofar as it works by psychological means; and for the time being we have no other. The future may teach us to exercise a direct influence, by means of particular chemical substances, on the amounts of energy and their distribution in the mental apparatus. It may be that there are other still undreamt-of possibilities of therapy. But for the moment we have nothing better at our disposal than the technique of psychoanalysis, and for that reason, in spite of its limitations, it should not be despised.

CHAPTER VII
AN EXAMPLE OF PSYCHOANALYTIC WORK

We have arrived at a general acquaintance with the psychical apparatus, [183]
with the parts, organs and agencies of which it is composed, with the forces which operate in it and with the functions allotted to its parts. The neuroses and psychoses are the states in which disturbances in the functioning of the apparatus come to expression. We have chosen the neuroses as the subjects of our study because they alone seem accessible to the psychological methods of our intervention. While we are trying to influence them, we collect observations which give us a picture of their origin and of the manner in which they arise.

I will state in advance one of our chief findings before proceeding with my description. The neuroses (unlike infectious diseases, for instance) have no specific determinants. It would be idle to seek in them pathogenic excitants. They shade off by easy transitions into what is described as the normal; and, on the other hand, there is scarcely any state recognized as normal in which indications of neurotic traits could not be pointed out. Neurotics have approximately the same innate dispositions as other people, they have the same experiences and they have the same tasks to perform. Why is it, then, that they live so much worse and with so much greater difficulty and, in the process, suffer more feelings of unpleasure, anxiety and pain?

We need not be at a loss to find an answer to this question. Quantitative *disharmonies* are what must be held responsible for the inadequacy and sufferings of neurotics. The determining cause of all the forms taken by human mental life is, indeed, to be sought in the reciprocal action between innate dispositions and accidental experiences. Now a particular drive may be too strong or too weak innately, or a particular capacity may be stunted or insufficiently developed in life. On the other hand, external impressions and experiences may make demands of differing strength on different people; and what one person's constitution can deal with may prove an unmanageable task for another's. These [184]
quantitative differences will determine the variety of the results.

We shall very soon feel, however, that this explanation is unsatisfactory: it is too general, it explains too much. The aetiology put forward applies to every case of mental suffering, misery and disablement, but not every such state can be termed neurotic. The neuroses have specific

characteristics, they are miseries of a particular kind. So we must after all expect to find particular causes for them. Or we may adopt the supposition that, among the tasks with which mental life has to deal, there are a few on which it can especially easily come to grief; so that the peculiarity of the phenomena of neurosis, which are often so very remarkable, would follow from this without our needing to withdraw our earlier assertions. If it remains true that the neuroses do not differ in any essential respect from the normal, their study promises to yield us valuable contributions to our knowledge of the normal. It may be that we shall thus discover the 'weak points' in a normal organization.

The supposition we have just made finds confirmation. Analytic experiences teach us that there is in fact one drive demand attempts to deal with which most easily fail or succeed imperfectly and that there is one period of life which comes in question exclusively or predominantly in connection with the generation of a neurosis. These two factors – the nature of the drive and the period of life concerned – call for separate consideration, although they are closely enough connected.

We can speak with a fair degree of certainty about the part played by the period of life. It seems that neuroses are acquired [*erworben*][1] only in early childhood (up to the age of six), even though their symptoms may not make their appearance till much later. The childhood neurosis may become manifest for a short time or may even be overlooked. In every case the later neurotic illness links up with the prelude in childhood. It is possible that what are known as traumatic neuroses (due to excessive fright [*Schreck*] or severe somatic shocks, such as railway collisions, burial under falls of earth, and so on) are an exception to this: their relations to determinants in childhood have hitherto eluded investigation. There is no difficulty in accounting for this aetiological preference for the first period of childhood. The neuroses are, as we know, disorders of the ego; and it is not to be wondered at if the ego, so long as it is feeble, immature and incapable of resistance, fails to deal [185] with tasks which it could cope with later on with the utmost ease. In these circumstances drive demands from within, no less than excitations from the external world, operate as 'traumas', particularly if they are met halfway by certain innate dispositions. The helpless ego fends them off by means of attempts at flight (*repressions*), which later turn out to be inefficient and which involve permanent restrictions on further development. The damage inflicted on the ego by its first experiences

1 [So in the German, although the context seems to demand 'neuroses develop' rather than 'neuroses are acquired'.]

gives us the appearance of being disproportionately great; but we have only to take as an analogy the differences in the results produced by the prick of a needle into a mass of cells in the act of cell division (as in Roux's experiments) and into the fully grown animal which eventually develops out of them.[1] No human individual is spared such traumatic experiences; none escapes the repressions to which they give rise. These questionable reactions on the part of the ego may perhaps be indispensable for the attainment of another aim which is set for the same period of life: in the space of a few years the little primitive creature must turn into a civilized human being [*zivilisiertes Menschenkind*]; he must pass through an immensely long stretch of human cultural development [*Kulturentwicklung*] in an almost uncannily abbreviated form. This is made possible by hereditary disposition; but it can almost never be achieved without the additional help of upbringing [*Erziehung*], of parental influence, which, as a precursor to the superego, restricts the ego's activity by prohibitions and punishments, and encourages or compels the setting up of repressions. We must therefore not forget to include the influence of civilization among the determinants of neurosis. It is easy, as we can see, for a barbarian to be healthy; for a civilized man [*Kulturmenschen*] the task is hard. The desire for a powerful, uninhibited ego may seem to us intelligible; but, as we are taught by the times we live in, it is in the profoundest sense hostile to civilization. And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species – the prolonged period of its childhood dependence – in the aetiology of the neuroses.

As regards the other point – the specific drive-related factor – we come upon an interesting discrepancy between theory and experience. [186]
Theoretically there is no objection to supposing that any sort of drive demand might occasion the same repressions and their consequences; but our observation shows us invariably, so far as we can judge, that the excitations that play this pathogenic part arise from the component drives of sexual life. The symptoms of neuroses are, it might be said, without exception either a substitutive satisfaction of some sexual urge or measures to prevent such a satisfaction; and as a rule they are compromises between the two, of the kind that come about in accordance with the laws operating between contraries in the unconscious. The gap in our theory cannot at present be filled; our decision is made more difficult by the fact that most of the urges of sexual life are not of a

1 [Wilhelm Roux (1850–1924) was one of the founders of experimental embryology.]

purely erotic nature but have arisen from alloys of the erotic drive with portions of the destructive drive. But it cannot be doubted that the drives which manifest themselves physiologically as sexuality play a prominent, unexpectedly large part in the causation of the neuroses – whether it is an exclusive one remains to be decided. It must also be borne in mind that in the course of cultural development no other function has been so energetically and extensively repudiated as precisely the sexual one. Theory must rest satisfied with a few hints that betray a deeper connection: the fact that the first period of childhood, during which the ego begins to be differentiated from the id, is also the period of the early sexual efflorescence which is brought to an end by the period of latency; that it can hardly be a matter of chance that this momentous early period subsequently falls victim to infantile amnesia; and lastly, that biological changes in sexual life (such as the function's diphasic onset which we have already mentioned, the disappearance of the periodic character of sexual excitation and the transformation in the relation between female menstruation and male excitation) – that these innovations in sexuality must have been of high importance in the evolution of animals into man. It is left for the science of the future to bring these still isolated data together into a new understanding. It is not in psychology but in biology that there is a gap here. We shall not be wrong, perhaps, in saying that the weak point in the ego's organization seems to lie in its attitude to the sexual function, as though the biological antithesis between self-preservation and the preservation of the species had found a psychological expression at that point.

[187] Analytic experience has convinced us of the complete truth of the assertion so often to be heard that the child is psychologically father to the adult and that the events of his first years are of paramount importance for his whole later life. It will thus be of special interest to us if there is something that may be described as the central experience of this period of childhood. Our attention is first attracted by the effects of certain influences which do not apply to all children, though they are common enough – such as the sexual abuse of children by adults, their seduction by other children (brothers or sisters) slightly their seniors, and, what we should not expect, their being deeply stirred by seeing or hearing at first hand sexual behaviour between adults (their parents) mostly at a time at which one would not have thought they could either be interested in or understand any such impressions, or be capable of remembering them later. It is easy to confirm the extent to which such experiences arouse a child's susceptibility and force his own sexual

urges into certain channels from which they cannot afterwards depart. Since these impressions are subjected to repression either at once or as soon as they seek to return as memories, they constitute the determinant for the neurotic compulsion which will subsequently make it impossible for the ego to control the sexual function and will probably cause it to turn away from that function permanently. If this latter reaction occurs, the result will be a neurosis; if it is absent, a variety of perversions will develop, or the function, which is of immense importance not only for reproduction but also for the entire shaping of life, will become totally unmanageable.

However instructive cases of this kind may be, a still higher degree of interest must attach to the influence of a situation which every child is destined to pass through and which follows inevitably from the factor of the prolonged period during which a child is cared for by other people and lives with his parents. I am thinking of the *Oedipus complex*, so named because its essential substance is to be found in the Greek legend of King Oedipus, which has fortunately been preserved for us in a version by a great dramatist. The Greek hero killed his father and took his mother to wife. That he did so unwittingly, since he did not know them as his parents, is a deviation from the analytic facts which we can easily understand and which, indeed, we shall recognize as inevitable.

At this point we must give separate accounts of the development of [188]
boys and girls (of males and females), for it is now that the difference between the sexes finds psychological expression for the first time. We are faced here with the great enigma of the biological fact of the duality of the sexes: it is an ultimate fact for our knowledge, it defies every attempt to trace it back to something else. Psychoanalysis has contributed nothing to clearing up this problem, which clearly falls wholly within the province of biology. In mental life we find only reflections of this great antithesis; and their interpretation is made more difficult by the fact, long suspected, that no individual is limited to the modes of reaction of a single sex but always finds some room for those of the opposite one, just as his body bears, alongside of the fully developed organs of one sex, atrophied and often useless rudiments of those of the other. For distinguishing between male and female in mental life we make use of what is obviously an inadequate empirical and conventional equation: we call everything that is strong and active male, and everything that is weak and passive female. This fact of psychological bisexuality, too, embarrasses all our enquiries into the subject and makes them harder to describe.

A child's first erotic object is the mother's breast that nourishes it; love has its origin in attachment [*Anlehnung*][T] to the satisfied need for nourishment. There is no doubt that, to begin with, the child does not distinguish between the breast and its own body; when the breast has to be separated from the body and shifted to the '*outside*' because the child so often finds it absent, it carries with it as an '*object*' a part of the original narcissistic libidinal cathexis. This first object is later completed into the person of the child's mother, who not only nourishes it but also looks after it and thus arouses in it a number of other physical sensations, pleasurable and unpleasurable. By her care of the child's body she becomes its first seducer. In these two relations lies the root of a mother's importance, unique, without parallel, established unalterably for a whole lifetime as the first and strongest love object and as the prototype of all later love relations – for both sexes. In all this the phylogenetic foundation has so much the upper hand over personal accidental experience that it makes no difference whether a child has really sucked at the breast or has been brought up on the bottle and never enjoyed the tenderness of a mother's care. In both cases the child's
[189] development takes the same path; it may be that in the second case its later longing grows all the greater. And for however long it is fed at its mother's breast, it will always be left with a conviction after it has been weaned that its feeding was too short and too little.

This preface is not superfluous, for it can heighten our realization of the intensity of the Oedipus complex. When a boy (from the age of two or three) has entered the phallic phase of his libidinal development, is feeling pleasurable sensations in his sexual organ and has learnt to procure these at will by manual stimulation, he becomes his mother's lover. He wishes to possess her physically in such ways as he has divined from his observations and intuitions about sexual life, and he tries to seduce her by showing her the male organ which he is proud to own. In a word, his early awakened masculinity seeks to take his father's place with her; his father has hitherto in any case been an envied model to the boy, owing to the physical strength he perceives in him and the authority with which he finds him clothed. His father now becomes a rival who stands in his way and whom he would like to get rid of. If while his father is away he is allowed to share his mother's bed and if when his father returns he is once more banished from it, his satisfaction when his father disappears and his disappointment when he emerges again are deeply felt experiences. This is the subject of the Oedipus complex, which the Greek legend has translated from the world of a child's

phantasy into pretended reality. Under the conditions of our civilization it is invariably doomed to a frightening end.

The boy's mother has understood quite well that his sexual excitation relates to herself. Sooner or later she reflects that it is not right to allow it to continue. She thinks she is doing the correct thing in forbidding him to handle his genital organ. Her prohibition has little effect; at the most it brings about some modification in his method of obtaining satisfaction. At last his mother adopts the severest measures; she threatens to take away from him the thing he is defying her with. Usually, in order to make the threat more frightening and more credible, she delegates its execution to the boy's father, saying that she will tell him and that he will cut the penis off. Strange to say, this threat operates only if another condition is fulfilled before or afterwards. In itself it seems too inconceivable to the boy that such a thing could happen. But if at the time of [190]
the threat he can recall the appearance of female genitals or if shortly afterwards he has a sight of them – of genitals, that is to say, which really lack this supremely valued part – then he takes what he has heard seriously and, coming under the influence of the *castration complex*, experiences the severest trauma of his young life.[1]

The results of the threat of castration are multifarious and incalculable; they affect the whole of a boy's relations with his father and mother and subsequently with men and women in general. As a rule the child's masculinity is unable to stand up to this first shock. In order to preserve his sexual organ he renounces the possession of his mother more or less completely; his sexual life often remains permanently encumbered by the prohibition. If a strong feminine component, as we call it, is present in him, its strength is increased by this intimidation of his masculinity. He falls into a passive attitude to his father, such as he attributes to his mother. It is true that as a result of the threat he has given up masturbation, but not the activities of his imagination accompanying it. On the contrary, since these are now the only form of sexual satisfaction remaining to him, he indulges in them more than before and in these phantasies, though he still continues to identify himself with his

1 Castration has a place too in the Oedipus legend, for the blinding with which Oedipus punishes himself after the discovery of his crime is, by the evidence of dreams, a symbolic substitute for castration. The possibility cannot be excluded that a phylogenetic memory trace may contribute to the extraordinarily terrifying effect of the threat – a memory trace from the prehistory of the primal family, when the jealous father actually robbed his son of his genitals if the latter became troublesome to him as a rival with a woman. The primaeval custom of circumcision, another symbolic substitute for castration, can only be understood as an expression of submission to the father's will. (Cf. the puberty rites of primitive peoples.) No investigation has yet been made of the form taken by the events described above among peoples and in civilizations which do not suppress masturbation in children.

father, he also does so, simultaneously and perhaps predominantly, with his mother. Derivatives and modified products of these early masturbatory phantasies usually make their way into his later ego and play a part in the formation of his character. Apart from this encouragement of his femininity, fear and hatred of his father gain greatly in intensity. The boy's masculinity withdraws, as it were, into a defiant attitude towards
[191] his father, which will dominate his later behaviour in human society in a compulsive fashion. A residue of his erotic fixation to his mother is often left in the form of an excessive dependence on her, and this persists as a kind of bondage to women.[1] He no longer ventures to love his mother, but he cannot risk not being loved by her, for in that case he would be in danger of being betrayed by her to his father and handed over to castration. The whole experience, with all its antecedents and consequences, of which my account has been able to give only a selection, is subjected to a highly energetic repression, and, as is made possible by the laws operating in the unconscious id, all the mutually contending emotional impulses and reactions which are set going at that time are preserved in the unconscious and ready to disturb the later development of the ego after puberty. When the somatic process of sexual maturation puts fresh life into the old libidinal fixations which had apparently been surmounted, sexual life will turn out to be inhibited, without homogeneity and fallen apart into mutually conflicting urges.

It is no doubt true that the impact of the threat of castration upon a boy's budding sexual life does not always have these dreaded consequences. It will depend once again on *quantitative* relations how much damage is done and how much avoided. The whole occurrence, which may probably be regarded as the central experience of the years of childhood, the greatest problem of early life and the strongest source of later inadequacy, is so completely forgotten that its reconstruction during the work of analysis is met in adults by the most decided disbelief. Indeed, aversion to it is so great that people try to silence any mention of the proscribed subject and the most obvious reminders of it are overlooked by a strange intellectual blindness. One may hear it objected, for instance, that the legend of King Oedipus has in fact no connection with the construction made by analysis: the cases are quite different, since Oedipus did not know that it was his father that he killed and his mother that he married. What is overlooked in this is that a distortion of this kind is inevitable if an attempt is made at a poetic handling of the

1 [Cf. a footnote to Section VIII of 'Analysis Terminable and Interminable' (1937*c*), p. 228 *n.* below.]

material, and that there is no introduction of extraneous material but only a skilful employment of the factors presented by the theme. The ignorance of Oedipus is a legitimate representation of the unconscious state into which, for adults, the whole experience has fallen; and the [192] coercive power of the oracle, which makes or should make the hero innocent, is a recognition of the inevitability of the fate which has condemned every son to live through the Oedipus complex. Again it was pointed out from psychoanalytic quarters how easily the riddle of another dramatic hero, Shakespeare's procrastinator, Hamlet, can be solved by reference to the Oedipus complex, since the prince came to grief over the task of punishing someone else for what coincided with the substance of his own Oedipus wish – whereupon the general lack of understanding on the part of the literary world showed how ready is the mass of mankind to hold fast to its infantile repressions.[1]

Yet more than a century before the emergence of psychoanalysis the French philosopher Diderot bore witness to the importance of the Oedipus complex by expressing the difference between the primitive and civilized worlds in this sentence: 'Si le petit sauvage était abandonné à lui-même, qu'il conservât toute son imbécillité, et qu'il réunît au peu de raison de l'enfant au berceau la violence des passions de l'homme de trente ans, il tordrait le col à son père et coucherait avec sa mère.'[2] I venture to say that, if psychoanalysis could boast of no other achieve- [193] ment than the discovery of the repressed Oedipus complex, that alone would give it a claim to be included among the precious new acquisitions of mankind.

The effects of the castration complex in little girls are more uniform and no less profound. A female child has, of course, no need to fear the loss of a penis; she must, however, react to the fact of not having received

1 The name 'William Shakespeare' is very probably a pseudonym behind which a great unknown lies concealed. Edward de Vere, Earl of Oxford, a man who has been thought to be identifiable with the author of Shakespeare's works, lost a beloved and admired father while he was still a boy and completely repudiated his mother, who contracted a new marriage very soon after her husband's death. – [Freud's first mention of this view was in a sentence added in 1930 to a footnote to Chapter V (D) of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 236 *n*. He enlarged on the point in his 'Address in the Goethe House' (1930*e*), ibid., **21**, 199, as well as in a footnote added in 1935 to his *Autobiographical Study* (1925*d*), ibid., **20**, 55–6 *n*. He referred to it once more in a footnote to Section A of Part I of the third essay in *Moses and Monotheism* (1939*a*), p. 60 *n*. 2 above. A long argument in favour of this opinion is contained in a letter written by Freud to J. S. H. Branson on March 25, 1934, which is published in Appendix A (No. 27) to the third volume of Jones's biography (1957, 487–8).]

2 ['If the little savage were left to himself, preserving all his foolishness and adding to the small sense of a child in the cradle the violent passions of a man of thirty, he would strangle his father and lie with his mother.' (From *Le neveu de Rameau*.) Freud had quoted this twice already. Cf. Lecture XXI of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 297.]

one. From the very first she envies boys its possession; her whole development may be said to take place under the colours of envy for the penis. She begins by making vain attempts to do the same as boys and later, with greater success, makes efforts to compensate for her defect – efforts which may lead in the end to a normal feminine attitude. If during the phallic phase she tries to get pleasure like a boy by the manual stimulation of her genitals, it often happens that she fails to obtain sufficient satisfaction and extends her judgement of inferiority from her stunted penis to her whole self. As a rule she soon gives up masturbating, since she has no wish to be reminded of the superiority of her brother or playmate, and turns away from sexuality altogether.

If a little girl persists in her first wish – to grow into a boy – in extreme cases she will end as a manifest homosexual, and otherwise she will exhibit markedly masculine traits in the conduct of her later life, will choose a masculine vocation, and so on. The other path leads by way of abandoning the mother she has loved: the daughter, under the influence of her envy for the penis, cannot forgive her mother for having sent her into the world so insufficiently equipped. In her resentment over this she gives up her mother and puts someone else in her place as the object of her love – her father. If one has lost a love object, the most obvious reaction is to identify oneself with it, to replace it from within, as it were, by identification. This mechanism now comes to the little girl's help. Identification with her mother can take the place of attachment to her mother. The little daughter puts herself in her mother's place, as she has always done in her games; she tries to take her mother's place with her father, and begins to hate the mother she used to love, and from two motives: from jealousy as well as from mortification over the penis she has been denied. Her new relation to her father may start by having as its content a wish to have his penis at her disposal, but it culminates in another wish
[194] – to have a baby from him as a gift. The wish for a baby has thus taken the place of the wish for a penis, or has at all events split off from it.

It is an interesting thing that the relation between the Oedipus complex and the castration complex should take such a different shape – an opposite one, in fact – in the case of females as compared to that of males. In males, as we have seen, the threat of castration brings the Oedipus complex to an end; in females we find that, on the contrary, it is their lack of a penis that forces them into their Oedipus complex. It does little harm to a woman if she remains in her feminine Oedipus attitude. (The term 'Electra complex' has been proposed for it.[1]) She

1 [The term seems to have been used first by Jung (1913, 370). Freud argued against its introduction in his paper on 'Female Sexuality' (1931*b*), *RSE*, **21**, 218–19.]

will in that case choose her husband for his paternal characteristics and be ready to recognize his authority. Her longing to possess a penis, which is in fact unappeasable, may find satisfaction if she can succeed in completing her love for the organ by extending it to the bearer of the organ, just as happened earlier when she progressed from her mother's breast to her mother as a whole person.

If we ask an analyst what his experience has shown to be the mental structures least accessible to influence in his patients, the answer will be: in a woman her wish for a penis, in a man his [repudiation of a] feminine attitude towards his own sex, a precondition of which would, of course, be the loss of his penis.[1]

1 [Freud had discussed this at much greater length in Section VIII of 'Analysis Terminable and Interminable' (1937*c*), p. 226 ff. below.]

PART III
THE THEORETICAL YIELD

CHAPTER VIII
THE PSYCHICAL APPARATUS AND THE EXTERNAL WORLD

[195] All of the general discoveries and hypotheses which I brought forward in the first chapter were, of course, arrived at by laborious and patient detailed work of the kind of which I have given an example in the previous chapter. We may now feel tempted to make a survey of the increases in knowledge that we have achieved by work such as this and to consider what paths we have opened for further advances. In this connection we may be struck by the fact that we have so often been obliged to venture beyond the frontiers of the science of psychology. The phenomena with which we were dealing do not belong to psychology alone; they have an organic and biological side as well, and accordingly in the course of our efforts at building up psychoanalysis we have also made some important biological discoveries and have not been able to avoid framing new biological hypotheses.

But let us for the moment keep to psychology. We have seen that it is not scientifically feasible to draw a line of demarcation between what is psychically normal and abnormal; so that that distinction, in spite of its practical importance, possesses only a conventional value. We have thus established a right to arrive at an understanding of the normal life of the mind from a study of its disorders – which would not be admissible if these pathological states, neuroses and psychoses, had specific causes operating in the manner of foreign bodies.

The study of a mental disorder occurring during sleep, which is transient and harmless and which, indeed, performs a useful function, has given us a key to the understanding of the mental diseases which are permanent and injurious to life. And we may now venture on the [196] assertion that the psychology of consciousness was no better capable of understanding the normal functioning of the mind than of

understanding dreams. The data of conscious self-perception, which alone were at its disposal, have proved in every respect inadequate to fathom the profusion and complexity of the processes of the mind, to reveal their interconnections and so to recognize the determinants of their disturbances.

The hypothesis we have adopted of a psychical apparatus extended in space, expediently put together, developed by the exigencies of life, which gives rise to the phenomena of consciousness only at one particular point and under certain conditions – this hypothesis has put us in a position to establish psychology on foundations similar to those of any other science, such, for instance, as physics. In our science as in the others the problem is the same: behind the attributes (qualities) of the object under examination which are presented directly to our perception, we have to discover something else which is more independent of the particular receptive capacity of our sense organs and which approximates more closely to what may be supposed to be the real state of affairs. We have no hope of being able to reach the latter itself, since it is evident that everything new that we have inferred must nevertheless be translated back into the language of our perceptions, from which it is simply impossible for us to free ourselves. But herein lies the very nature and limitation of our science. It is as though we were to say in physics: 'If we could see clearly enough we should find that what appears to be a solid body is made up of particles of such and such a shape and size and occupying such and such relative positions.' In the meantime we try to increase the efficiency of our sense organs to the furthest possible extent by artificial aids; but it may be expected that all such efforts will fail to affect the ultimate outcome. Reality will always remain 'unknowable'. The yield brought to light by scientific work from our primary sense perceptions will consist in an insight into connections and dependent relations which are present in the external world, which can somehow be reliably reproduced or reflected in the internal world of our thought and a knowledge of which enables us to 'understand' [*verstehen*] something in the external world, to foresee it and possibly to alter it. Our procedure in psychoanalysis is quite similar. We have discovered technical methods of filling in the gaps in the phenomena of our consciousness, and we [197] make use of those methods just as a physicist makes use of experiments. In this manner we infer a number of processes which are in themselves 'unknowable' and interpolate them in those that are conscious to us. And if, for instance, we say: 'At this point an unconscious memory intervened', what that means is: 'At this point something occurred of

which we are totally unable to form a conception, but which, if it had entered our consciousness, could only have been described in such and such a way.'

Our justification for making such inferences and interpolations and the degree of certainty attaching to them of course remain open to criticism in each individual instance; and it cannot be denied that it is often extremely difficult to arrive at a decision – a fact which finds expression in the lack of agreement among analysts. The novelty of the problem is to blame for this – that is to say, a lack of training. But there is besides this a special factor inherent in the subject itself; for in psychology, unlike physics, we are not always concerned with things which can only arouse a cool scientific interest. Thus we shall not be very greatly surprised if a woman analyst who has not been sufficiently convinced of the intensity of her own wish for a penis also fails to attach proper importance to that factor in her patients. But such sources of error [*Fehlerquellen*], arising from the personal equation, have no great importance in the long run. If one looks through old textbooks on the use of the microscope, one is astonished to find the extraordinary demands which were made on the personality of those who made observations with that instrument while its technique was still young – of all of which there is no question today.[1]

I cannot undertake to attempt a complete picture here of the psychical apparatus and its activities; I should find myself hindered, among other things, by the circumstance that psychoanalysis has not yet had time to study all those functions equally. I shall therefore content myself with a detailed recapitulation of the account in my opening chapter.

The core of our being, then, is formed by the obscure *id*, which has no direct communication with the external world and is accessible even to our own knowledge only through the medium of another agency. Within this id the organic *drives* operate, which are themselves compounded of fusions of two primal forces (Eros and destructiveness) in
[198] varying proportions and are differentiated from one another by their relation to organs or systems of organs. The one and only urge of these drives is towards satisfaction, which is expected to arise from certain changes in the organs with the help of objects in the external world. But immediate and unheeding satisfaction of the drives, such as the id demands, would often lead to perilous conflicts with the external world and to extinction. The id knows no solicitude about ensuring survival and no anxiety; or it would perhaps be more correct to say that, though

1 [Freud had of course himself experienced these 'extraordinary demands' in his early neuroscientific researches.]

it can generate the sensory elements of anxiety, it cannot make use of them. The processes which are possible in and between the assumed psychical elements in the id (the *primary process*) differ widely from those which are familiar to us through conscious perception in our intellectual and emotional life; nor are they subject to the critical restrictions of logic, which repudiates some of these processes as invalid and seeks to undo them.

The id, cut off from the external world, has a world of perception of its own.[1] It detects with extraordinary acuteness certain changes in its interior, especially oscillations in the tension of its drive needs, and these changes become conscious as feelings in the pleasure–unpleasure series. It is hard to say, to be sure, by what means and with the help of what sensory terminal organs these perceptions come about. But it is an established fact that self-perceptions – coenaesthetic feelings and feelings of pleasure–unpleasure – govern the passage [*Abläufe*] of events in the id with despotic force. The id obeys the inexorable pleasure principle. But not the id alone. It seems that the activity of the other psychical agencies too is able only to modify the pleasure principle but not to nullify it; and it remains a question of the highest theoretical importance, and one that has not yet been answered, when and how it is ever possible for the pleasure principle to be overcome. The consideration that the pleasure principle demands a reduction, at bottom the extinction perhaps, of the tensions of drive needs (that is, *Nirvana*) leads to the still unassessed relations between the pleasure principle and the two primal forces, Eros and the death drive.

The other agency of the mind, which we believe we know best and in which we recognize ourselves most easily – what is known as the *ego* – has been developed out of the id's cortical layer, which, through being adapted to the reception and exclusion of stimuli, is in direct contact [199] with the external world (*reality*). Starting from conscious perception it has subjected to its influence ever-larger regions and deeper strata of the id, and, in the persistence with which it maintains its dependence on the external world, it bears the indelible stamp of its origin (as it might be 'Made in Germany'[2]). Its psychological function consists in raising the passage [of events] in the id to a higher dynamic level (perhaps by

1 [This, and the next four sentences, seem to contradict Freud's earlier statement to the effect that the sensory terminal organs which 'receive conscious information from the inside of the body' (p. 146 above) and generate feelings of pleasure–unpleasure are prolongations of the cortical ego. It is highly unlikely that Freud intended here to revise his view that 'The sole prevailing quality in the id is that of being unconscious' (p. 147), but the internal contradictions are noteworthy. For a discussion of this problem, see the Editors' Introduction in 1950*a*; *RSE*, **1**, 313 *n.* 2.]

2 [In English in the original.]

transforming freely mobile energy into bound energy, such as corresponds to the preconscious state); its constructive function consists in interpolating, between the demand made by a drive and the action that satisfies it, the activity of thought which, after taking its bearings in the present and assessing earlier experiences, endeavours by means of experimental actions [*Probehandlungen*] to calculate the consequences of the course of action proposed. In this way the ego comes to a decision on whether the attempt to obtain satisfaction is to be carried out or postponed or whether it may not be necessary for the demand by the drive to be suppressed altogether as being dangerous. (Here we have the *reality principle*.) Just as the id is directed exclusively to obtaining pleasure, so the ego is governed by considerations of safety. The ego has set itself the task of self-preservation, which the id appears to neglect. It [the ego] makes use of the sensations of anxiety as a signal to give a warning of dangers that threaten its integrity. Since memory traces can become conscious just as perceptions do, especially through their association with residues of speech, the possibility arises of a confusion which would lead to a mistaking of reality. The ego guards itself against this possibility by the institution of *reality-testing*, which is allowed to fall into abeyance in dreams on account of the conditions prevailing in the state of sleep. The ego, which seeks to maintain itself in an environment of overwhelming mechanical forces, is threatened by dangers which come in the first instance from external reality; but dangers do not threaten it from there alone. Its own id is a source of similar dangers, and that for two different reasons. In the first place, an excessive strength of drive can damage the ego in a similar way to an excessive 'stimulus' from the external world. It is true that the former cannot destroy it; but it can destroy its characteristic dynamic organization and change the ego back into a portion of
[200] the id. In the second place, experience may have taught the ego that the satisfaction of some drive demand which is not in itself intolerable would involve dangers in the external world, so that a drive demand of that kind itself becomes a danger. Thus the ego is fighting on two fronts: it has to defend its existence against an external world which threatens it with annihilation as well as against an internal world that makes excessive demands. It adopts the same methods of defence [*Verteidigung*] against both, but its defence [*Abwehr*] against the internal enemy is particularly inadequate. As a result of having originally been identical to this latter enemy and of having lived with it since on the most intimate terms, it has great difficulty in escaping from the internal dangers. They persist as threats, even if they can be temporarily held down.

We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of *loss of love* which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence – repressions – which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later reanimation of sexual life brings a reinforcement to the drive demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task – if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual drive, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture.[1] The drive demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these detours they may become desexualized and their connection with their original drive aims may become [201]

1 [The very similar concept of 'susceptibility to culture' had been discussed by Freud at some length in the first section of 'Thoughts for the Times on War and Death' (1915*b*), *RSE*, **14**, 282–5, and was also mentioned in *The Future of an Illusion* (1927*c*), ibid., **21**, 35. – Freud made no distinction between the use of the words 'culture' and 'civilization'.]

looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual driving forces.

We have repeatedly had to insist on the fact that the ego owes its origin as well as the most important of its acquired characteristics to its relation to the real external world. We are thus prepared to assume that the ego's pathological states, in which it most approximates once again to the id, are founded on a cessation or slackening of that relation to the external world. This tallies very well with what we learn from clinical experience – namely, that the precipitating cause of the outbreak of a psychosis is either that reality has become intolerably painful or that the drives have become extraordinarily intensified – both of which, in view of the rival claims made on the ego by the id and the external world, must lead to the same result. The problem of psychoses would be simple and perspicuous if the ego's detachment from reality could be carried through completely. But that seems to happen only rarely or perhaps never. Even in a state so far removed from the reality of the
[202] external world as one of hallucinatory confusion,[1] one learns from patients after their recovery that at the time in some corner of their mind (as they put it) there was a normal person hidden, who, like a detached spectator, watched the hubbub of illness go past him. I do not know if we may assume that this is so in general, but I can report the same of other psychoses with a less tempestuous course. I call to mind a case of chronic paranoia in which after each attack of jealousy a dream conveyed to the analyst a correct picture of the precipitating cause, free from any delusion.[2] An interesting contrast was thus brought to light: while we are accustomed to discover from the dreams of neurotics jealousies which are alien to their waking lives, in this psychotic case the delusion which dominated the patient in the daytime was corrected by his dream. We may probably take it as being generally true that what occurs in all these cases is a psychical *split* [*Spaltung*]. Two psychical attitudes have been formed instead of a single one – one, the normal one, which takes account of reality, and another which under the influence of the drives detaches the ego from reality. The two exist alongside of each other. The issue depends on their relative strength. If the second is or becomes the stronger, the necessary precondition for a psychosis is present. If the relation is reversed, then there is an apparent cure of the delusional disorder. Actually it has only retreated into the unconscious – just as numerous observations lead us to believe that the delusion existed ready-made for a long time before its manifest irruption.

1 [Freud adds the term 'amentia', used by Meynert in this sense.]

2 [This case is reported at some length in Freud's paper 'Some Neurotic Mechanisms' (1922*b*), *RSE*, **18**, 218 f.]

The view which postulates that in all psychoses there is a *splitting of the ego* could not call for so much notice if it did not turn out to apply to other states more like the neuroses and, finally, to the neuroses themselves. I first became convinced of this in cases of *fetishism*. This abnormality, which may be counted as one of the perversions, is, as is well known, based on the patient (who is almost always male) not recognizing the fact that females have no penis – a fact which is extremely undesirable to him since it is a proof of the possibility of his being castrated himself. He therefore disavows his own sense perception which showed him that the female genitals lack a penis and holds fast to the contrary conviction. The disavowed perception does not, however, [203] remain entirely without influence for, in spite of everything, he has not the courage to assert that he actually saw a penis. He takes hold of something else instead – a part of the body or some other object – and assigns it the role of the penis which he cannot do without. It is usually something that he, in fact, saw at the moment at which he saw the female genitals, or it is something that can suitably serve as a symbolic substitute for the penis. Now it would be incorrect to describe this process when a fetish is constructed as a splitting of the ego; it is a compromise formed with the help of displacement, such as we have been familiar with in dreams. But our observations show us still more. The creation of the fetish was due to an intention to destroy the evidence for the possibility of castration, so that fear of castration could be avoided. If females, like other living creatures, possess a penis, there is no need to tremble for the continued possession of one's own penis. Now we come across fetishists who have developed the same fear of castration as non-fetishists and react in the same way to it. Their behaviour is therefore simultaneously expressing two contrary premises. On the one hand they are disavowing the fact of their perception – the fact that they saw no penis in the female genitals; and on the other hand they are recognizing the fact that females have no penis and are drawing the correct conclusions from it. The two attitudes persist side by side throughout their lives without influencing each other. Here is what may rightly be called a splitting of the ego. This circumstance also enables us to understand how it is that fetishism is so often only partially developed. It does not govern the choice of object exclusively but leaves room for a greater or lesser amount of normal sexual behaviour; sometimes, indeed, it retires into playing a modest part or is limited to a mere hint. In fetishists, therefore, the detachment of the ego from the reality of the external world has never succeeded completely.

It must not be thought that fetishism presents an exceptional case as regards a splitting of the ego; it is merely a particularly favourable subject for studying the question. Let us return to our thesis that the childish ego, under the domination of the real world, gets rid of undesirable drive demands by what are called repressions. We will now supplement this by further asserting that, during the same period of life, the ego often enough finds itself in the position of fending off some demand
[204] from the external world which it feels distressing and that this is effected by means of a *disavowal* of the perceptions which bring to knowledge this demand from reality. Disavowals of this kind occur very often and not only with fetishists; and whenever we are in a position to study them they turn out to be half-measures, incomplete attempts at detachment from reality. The disavowal is always supplemented by an acknowledgement; two contrary and independent attitudes always arise and result in the situation of there being a splitting of the ego. Once more the issue depends on which of the two can seize hold of the greater intensity.[1]

The facts of this splitting of the ego, which we have just described, are neither so new nor so strange as they may at first appear. It is indeed a universal characteristic of neuroses that there are present in the subject's mental life, as regards some particular behaviour, two different attitudes, contrary to each other and independent of each other. In the case of neuroses, however, one of these attitudes belongs to the ego and the contrary one, which is repressed, belongs to the id. The difference between this case and the other [discussed in the previous paragraph] is essentially a topographical or structural one, and it is not always easy to decide in an individual instance with which of the two possibilities one is dealing. They have, however, the following important characteristic in common. Whatever the ego does in its efforts of defence, whether it seeks to disavow a portion of the real external world or whether it seeks to reject a drive demand from the internal world, its success is never complete and unqualified. The outcome always lies in two contrary attitudes, of which the defeated, weaker one, no less than the other, leads to psychical complications. In conclusion, it is necessary only to point out how little of all these processes becomes known to us through our conscious perception.[2]

1 [I.e. the greater psychical energy. See footnote, p. 151 above.]

2 [The account of fetishism in this chapter is mainly derived from Freud's paper on the subject written some ten years before (1927*e*), where an early reference to a splitting of the ego can also be found. Cf. the Editors' Note to that paper, *RSE*, **21**, 136. Both these questions had also been approached in a paper 'Splitting of the Ego in the Process of Defence' (1940*e* [1938]) (see p. 249 ff. below), which Freud had begun a few months before he wrote the present work. A discussion of the position appears in the Editors' Note to that paper, p. 247 below.]

CHAPTER IX
THE INTERNAL WORLD

We have no way of conveying knowledge of a complicated set of simultaneous events except by describing them successively; and thus it happens that all our accounts are at fault to begin with owing to one-sided simplification and must wait till they can be supplemented, built on to, and so set right. [205]

The picture of an ego which mediates between the id and the external world, which takes over the drive demands of the former in order to lead them to satisfaction, which derives perceptions from the latter and uses them as memories, which, intent on its self-preservation, puts itself in defence against excessively strong claims from both sides and which, at the same time, is guided in all its decisions by the injunctions of a modified pleasure principle – this picture in fact applies to the ego only up to the end of the first period of childhood, till about the age of five. At about that time an important change has taken place. A portion of the external world has, at least partially, been abandoned as an object and has instead, by identification, been taken into the ego and thus become an integral part of the internal world. This new psychical agency continues to carry on the functions which have hitherto been performed by the people [the abandoned objects] in the external world: it observes the ego, gives it orders, judges it and threatens it with punishments, exactly like the parents whose place it has taken. We call this agency the *superego* and are aware of it in its judicial functions as our *conscience*. It is a remarkable thing that the superego often displays a severity for which no model has been provided by the real parents, and, moreover, that it calls the ego to account not only for its deeds but equally for its thoughts and unexecuted intentions, of which the superego seems to have knowledge. This reminds us that the hero of the Oedipus legend too felt guilty for his deeds and submitted himself to self-punishment, although the coercive power of the oracle should have acquitted him of guilt in our judgement and his own. The superego is, in fact, the heir to the Oedipus complex and is established only after that complex has been disposed of. For that reason its excessive severity does not follow [206] a real model but corresponds to the strength of the defence used against the temptation of the Oedipus complex. Some suspicion of this state of things lies, no doubt, at the bottom of the assertion made by

philosophers and believers that the moral sense is not instilled into men by education or acquired by them in their social life but is implanted in them from a higher source.

So long as the ego works in full harmony with the superego it is not easy to distinguish between their manifestations; but tensions and estrangements between them make themselves very plainly visible. The torments caused by the reproaches of conscience correspond precisely to a child's fear [*Angst*] of loss of love, a fear the place of which has been taken by the moral agency. On the other hand, if the ego has successfully resisted a temptation to do something which would be objectionable to the superego, it feels raised in its self-esteem and strengthened in its pride, as though it had made some precious acquisition. In this way the superego continues to play the part of an external world for the ego, although it has become a portion of the internal world. Throughout later life it represents the influence of a person's childhood, of the care and education [*Erziehung*] given him by his parents and of his dependence on them – a childhood which is prolonged so greatly in human beings by a family life in common. And in all this it is not only the personal qualities of these parents that is making itself felt, but also everything that had a determining effect on them themselves, the tastes and standards of the social class in which they lived and the innate dispositions and traditions of the race from which they sprang. Those who have a liking for generalizations and sharp distinctions may say that the external world, in which the individual finds himself exposed after being detached from his parents, represents the power of the present; that his id, with its inherited trends, represents the organic past; and that the superego, which comes to join them later, represents more than anything the cultural past, which a child has, as it were, to repeat as an after-experience during the few years of his early life. It is unlikely that such generalizations can be universally correct. Some portion of the cultural acquisitions have undoubtedly left a precipitate behind them in the id; much of what is contributed by the superego will
[207] awaken an echo in the id; not a few of the child's new experiences will be intensified because they are repetitions of some primaeval phylogenetic experience.

> Was du ererbt von deinen Vätern hast,
> Erwirb es, um es zu besitzen.[1]

1 ['What thou hast inherited from thy fathers, acquire it to make it thine.' Goethe, *Faust*, Part I, Scene 1. – Freud had quoted this previously in his *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 145.]

Thus the superego takes up a kind of intermediate position between the id and the external world; it unites in itself the influences of the present and the past. In the establishment of the superego we have before us, as it were, an example of the way in which the present is changed into the past.[1]

1 [The *SE* translation, like the *GW* edition, ends with three dots, suggesting that this work was unfinished. The authoritative opinion of Grubrich-Simitis (1993, 280; trans., 221) is that the manuscript itself does not show any sign of an intention on Freud's part to continue it.]

ANALYSIS TERMINABLE AND INTERMINABLE

The present translation is a modified and revised reprint of the *SE* version. The last eight and a half paragraphs of Section VI of the original German were reprinted in the autumn of 1937 in *Almanach der Psychoanalyse 1938*, 44–50.

This paper was written early in 1937 and published in June. It and the following one, on 'Constructions in Analysis' (1937*d*), were the last strictly psychoanalytic writings by Freud to be brought out in his lifetime. Nearly twenty years had passed since he had published a purely technical work, though questions of technique had, of course, been dealt with in his other writings.

Freud's main earlier discussion of the workings of psychoanalytic therapy was in Lectures XXVII and XXVIII of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**. He had returned to the subject very much more briefly in Lecture XXXIV of the *New Introductory Lectures* (1933*a*), ibid., **22**. Readers of these earlier writings are sometimes struck by what seem to be differences between the present work and its predecessors, and these apparent divergences call for examination.

The paper as a whole gives an impression of pessimism in regard to the therapeutic efficacy of psychoanalysis. Its limitations are constantly stressed, the difficulties of the procedure and the obstacles standing in its way are insisted upon. These, indeed, constitute its principal theme. In fact, however, there is nothing [212] revolutionary in this. Freud was always well aware of the barriers to success in analysis and was always ready to investigate them. Moreover, he was always eager

to direct attention to the importance of the non-therapeutic interests of psychoanalysis, the direction in which lay his own personal preferences, particularly in the later part of his life. It may be remembered that in the short discussion of technique in the *New Introductory Lectures* (1933*a*) he wrote that he had 'never been a therapeutic enthusiast' (*RSE*, **22**, 134). Thus there is nothing unexpected in the cool attitude shown in this paper towards the therapeutic ambitions of psychoanalysis or in the enumeration of the difficulties confronting it. What may perhaps cause more surprise are some features of Freud's examination of the underlying nature and causes of those difficulties.

It is noticeable, in the first place, that the factors to which he largely draws attention are of a physiological and biological nature. They are thus in the main insusceptible to psychological influences. Such, for instance, are the relative 'constitutional' strength of the drives (p. 202 ff. below) and the relative weakness of the ego owing to physiological causes such as puberty, the menopause and physical illness (p. 204). But the most powerful impeding factor of all and one totally beyond any possibility of control (to which some pages of the paper are devoted, p. 218 ff.) is the death drive. Freud here suggests that this is not only, as he had pointed out in earlier writings, responsible for much of the resistance met with in analysis, but that it is actually the ultimate cause of conflict in the mind (p. 220). In all of this, however, there is once again nothing revolutionary. Freud may be laying more stress than usual on constitutional factors among the difficulties confronting psychoanalysis, but he had always recognized their importance.

Nor are any of the three factors new which Freud selects here as being 'decisive' for the success of our therapeutic efforts (pp. 202–3): the more favourable prognosis for cases of 'traumatic' rather than 'constitutional' origin, the importance of 'quantitative' considerations, and the question of an 'alteration of the ego'. It is on this third point that so much fresh light is thrown in the present paper. In earlier accounts of the therapeutic process an essential place was always allotted to an alteration of the ego which was to be brought about by the analyst as a preliminary
[213] to the undoing of the patient's repressions. (See, for instance, the description in Lecture XXVIII of the *Introductory Lectures*, 1916–17*a*; *RSE*, **16**, 402.) But as to the nature of this alteration and how it could be effected very little was known. The recent advances in Freud's analysis of the ego now made it possible for him to carry the investigation further. The therapeutic alteration of the ego was now seen rather as the undoing of alterations already present as results of the defensive process. And it is worth recalling that the fact of alterations of the ego brought about by defensive processes had been mentioned by Freud at a very early date. The concept is to be found in his discussion of delusions in his second paper on the neuropsychoses of defence (1896*b*), ibid., **3**, 192 f., and at several points in his even earlier Draft K (Freud, 1950*a*) of January 1, 1896. Thereafter, the notion seems to have been in abeyance and the connection between anticathexes, reaction-formations and alterations of the ego is stated plainly for the first time in *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 139, 140 f. and 145. It reappears in the *New Introductory Lectures* (1933*a*), ibid., **22**, 80, and, after the long discussion of it in the present paper, in *Moses and Monotheism* (1939*a*), p. 71 above, and, finally, in the *Outline of Psychoanalysis* (1940*a*), pp. 161–2 above.

There is one respect, however, in which the views expressed by Freud in this

paper do seem to differ from, or even to contradict, his earlier ones – namely in the scepticism expressed by him here in regard to the *prophylactic* power of psychoanalysis. His doubts extend to the prospects of preventing not merely the occurrence of a fresh and different neurosis but even a return of a neurosis that has already been treated. The apparent change is shown if we recall a sentence in Lecture XXVII of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 393: 'A person who has become normal and free from the operation of repressed drive impulses in his relation to the doctor will remain so in his own life after the doctor has once more withdrawn from it.' And again, in Lecture XXVIII (ibid., 398), where Freud is comparing the effects of hypnotic suggestion and psychoanalysis: 'An analytic treatment demands from both doctor and patient the accomplishment of serious work, which is employed in lifting internal resistances. Through the overcoming of these resistances the patient's mental life is permanently changed, is raised to a high level of development and remains protected against fresh possibilities of falling ill.' Similarly, in the closing sentences of Lecture XXXI of the *New Introductory Lectures* (1933*a*), Freud writes that the intention of psychoanalysis is 'to strengthen the ego, to make it more independent of the superego, to widen its field of perception and enlarge its organization, so that it can appropriate fresh portions of the id. Where id was, there ego shall be.' (Ibid., **22**, 71.) The theory underlying these passages seems to be the same, and it seems to differ in important respects from the theory implied in the present work.[1] [214]

The basis of this increased scepticism of Freud's seems to be a conviction of the impossibility of dealing with a conflict that is not 'current' and of the grave objections to converting a 'latent' conflict into a 'current' one. This position appears to imply a change of view not merely about the therapeutic process but about mental events more generally. Here Freud seems to be regarding the 'currently active conflict' as something isolated, something, as it were, in a watertight compartment. Even if the ego is helped to cope with *this* conflict, its capacity to deal with *another* conflict will be unaffected. The drive forces too seem to be thought of as isolated in the same sort of way: the fact that their pressure has been eased in the current conflict throws no light on their subsequent behaviour. By contrast, according to the earlier view the analytic process seems to have been considered capable of altering the ego in a more *general* sense and one which would persist after the end of the analysis; and the drive forces seem to have been regarded as deriving their pressure from an *undifferentiated* reservoir of power. So that in proportion as the analysis had been successful, any fresh inroad by the drive forces would have had some of its pressure reduced by the analysis and they would be confronted with an ego which the analysis had made more capable of dealing with them. Thus there would be no absolute segregation of the 'current' conflict from the 'latent' ones; and the prophylactic power of an analysis (like its immediate outcome) would depend on quantitative considerations – on the relative increase brought about by it in the strength of the ego and the relative decrease in that of the drives.

It may be remarked that the account of the therapeutic effects of analysis written by Freud about a year after the present paper, in his *Outline of Psychoanalysis* (1940*a* [1938]), though it agrees closely in general with the account given here, seems [215]

1 It must be added that in another of the *New Introductory Lectures* (XXXIV) Freud is emphatic in insisting on the limitations of psychoanalytic therapy (*RSE*, **22**, 135–6).

to revert perhaps to his earlier view on the particular question we have just been considering. For instance, he writes there, after commenting on the great trouble involved in overcoming resistances: 'It is worthwhile, however, for it brings about an advantageous alteration of the ego which will be maintained independently of the outcome of the transference and will hold good in life.' (p. 161 above.) This would appear to suggest an alteration of a *general* kind.

It is of interest to note that at the very beginning of his practice Freud was worried by very much the same problems as these, which may thus be said to have extended over the entire length of his analytic studies. Here is an extract from a letter written by him to Wilhelm Fliess on April 16, 1900 (Freud, 1950*a*, Letter 133) on the subject of Herr E., who had been under treatment certainly since 1897 and probably at least since 1895, and to the ups and downs of whose case there are repeated references in the correspondence:

> E.'s career as a patient has at last come to an end with an invitation to spend an evening here. His riddle is *almost* completely solved, his condition is excellent, his whole being is altered: at the moment a residue of his symptoms remains. I am beginning to understand that the apparently interminable nature of the treatment is something determined by law and is dependent on the transference. I hope that this residue will not prejudice the practical success. It lay only with me to decide whether the treatment should be further prolonged; but it dawned on me that such a prolongation is a compromise between being ill and being well which patients themselves desire and to which for that reason the physician should not consent. The asymptotic termination of the treatment is substantially a matter of indifference to me; it is for outsiders rather that it is a disappointment. In any case I shall keep an eye on the man. . . .

ANALYSIS TERMINABLE AND INTERMINABLE[t]

I

Experience has taught us that psychoanalytic therapy – the freeing of someone from his neurotic symptoms, inhibitions [*Hemmungen*][T] and abnormalities of character – is a time-consuming business [*eine langwierige Arbeit*][t]. Hence, from the very first, attempts have been made to shorten the duration of analyses. Such endeavours required no justification; they could claim to be based on the strongest considerations of reason and expediency. But there was probably still at work in them as well some trace of the impatient contempt with which the medical science of an earlier day regarded the neuroses as being uncalled-for consequences of invisible injuries. If it had now become necessary to attend to them, they should at least be disposed of as quickly as possible. [216]

A particularly energetic attempt in this direction was made by Otto Rank, following upon his book, *The Trauma of Birth* (1924). He supposed that the true source of neurosis was the act of birth, since this involves the possibility of a child's 'primal fixation' ['*Urfixierung*'][T] to his mother not being surmounted but persisting as a 'primal repression' ['*Urverdrängung*'][T]. Rank hoped that if this primal trauma were subsequently [*nächtragliche*] dealt with by analysis the whole neurosis would be got rid of. Thus this one small piece of analytic work would save the necessity for all the rest. And a few months should be enough to accomplish this. It cannot be disputed that Rank's argument was bold and ingenious; but it did not stand the test of critical examination. Moreover, it was a child of its time, conceived under the stress of the contrast between the post-war misery of Europe and the 'prosperity'[1] of America, and designed to adapt the tempo of analytic therapy to the haste of American life. We have not heard much about what the implementation of Rank's plan has done for cases of sickness. Probably

Fixierung

Verdrängung

1 [In English in the original.]

not more than if the fire-brigade, called to deal with a house that had been set on fire by an overturned oil-lamp, contented themselves with
[217] removing the lamp from the room in which the blaze had started. No doubt a considerable shortening of the brigade's activities would be effected by this means. The theory and practice of Rank's experiment are now things of the past – no less than American 'prosperity' itself.[1]

I myself had adopted another way of speeding up an analytic treatment even before the war. At that time I had taken on the case of a young Russian, a man spoilt by wealth, who had come to Vienna in a state of complete helplessness, accompanied by a private doctor and an attendant.[2] In the course of a few years it was possible to give him back a large amount of his independence, to awaken his interest in life and to adjust his relations to the people most important to him. But there progress came to a stop. We advanced no further in clearing up the neurosis of his childhood, on which his later illness was based, and it was obvious that the patient found his present position highly comfortable and had no wish to take any step forward which would bring him nearer to the end of his treatment. It was a case of the treatment inhibiting itself: it was in danger of failing as a result of its – partial – success. In this predicament I resorted to the heroic measure of fixing a time limit for the analysis.[3] At the beginning of a year's work I informed the patient that the coming year was to be the last one of his treatment, no matter what he achieved in the time still left to him. At first he did not believe me, but once he was convinced that I was in deadly earnest, the desired change set in. His resistances shrank up, and in these last months of his treatment he was able to reproduce all the memories and to discover all the connections which seemed necessary for understanding his early neurosis and mastering his present one. When he left me in the midsummer of 1914, with as little suspicion as the rest of us of what lay so shortly ahead, I believed that his cure was radical and permanent.

[218] In a footnote added to this patient's case history in 1923,[4] I have already reported that I was mistaken. When, towards the end of the war, he

1 [This was written soon after the great financial crisis in the United States. A considered criticism of Rank's theory had been given by Freud in *Inhibitions, Symptoms and Anxiety* (1926*d*). See, in particular, *RSE*, **20**, 120–1 and 133–5.]

2 See my paper, published with the patient's consent, 'From the History of an Infantile Neurosis' (1918*b*). It contains no detailed account of the young man's adult illness, which is touched on only when its connection with his infantile neurosis absolutely requires it.

3 [See ibid., **17**, 9–10.]

4 [Ibid., 108–9.]

returned to Vienna, a refugee and destitute, I had to help him to master a part of the transference [*Übertragung*][T] which had not been resolved. This was accomplished in a few months, and I was able to end my footnote with the statement that 'since then the patient has felt normal and has behaved unexceptionably, in spite of the war having robbed him of his home, his possessions and all his family relationships'. Fifteen years have passed since then without disproving the truth of this verdict; but certain reservations have become necessary. The patient has stayed on in Vienna and has kept a place in society, if a humble one. But several times during this period his good state of health [*Wohlbefinden*][t] has been interrupted by attacks of illness which could only be construed as offshoots of his perennial neurosis. Thanks to the skill of one of my pupils, Dr Ruth Mack Brunswick, a short course of treatment has on each occasion brought these conditions to an end. I hope that Dr Mack Brunswick herself will shortly report on the circumstances.[1] Some of these attacks were still concerned with residual portions of the transference; and, where this was so, shortlived though they were, they showed a distinctly paranoid character. In other attacks, however, the pathogenic material consisted of pieces of the patient's childhood history, which had not come to light while I was analysing him and which now belatedly [*nachträglich*] came away – the comparison is unavoidable – like sutures after an operation, or small fragments of necrotic bone. I have found the history of this patient's recovery scarcely less interesting than that of his illness.

I have subsequently employed this fixing of a time limit in other cases as well, and I have also taken the experiences of other analysts into account. There can be only one verdict about the value of this blackmailing device: it is effective provided that one hits the right time for it. But it cannot guarantee to accomplish the task completely. On the contrary, we may be sure that, while part of the material will become accessible under the pressure of the threat, another part will be kept back and thus become buried, as it were, and lost to our therapeutic efforts. For once the analyst has fixed the time limit he cannot extend [219]
it; otherwise the patient would lose all faith in him. The most obvious way out would be for the patient to continue his treatment with another analyst, although we know that such a change will involve a fresh loss

1 [Her report had, in fact, already appeared several years earlier (Brunswick, 1928*a*). For further information on the later history of the case see an editorial footnote in *RSE*, **17**, 109. It is, however, possible that Freud was referring here to an anticipated second publication reporting on subsequent experiences with the patient – a report that ultimately did not appear (cf. Brunswick, 1945).]

of time and abandoning fruits of work already done. Nor can any general rule be laid down as to the right time for resorting to this forcible technical device; the decision must be left to the analyst's tact [*Takt*][t]. A miscalculation cannot be rectified. The saying that a lion only springs once must apply here.

II

The discussion of the technical problem of how to accelerate the slow progress of an analysis leads us to another, more deeply interesting question: is there such a thing as a natural end to an analysis – is there any possibility at all of bringing an analysis to such an end? To judge by the common talk of analysts it would seem to be so, for we often hear them say, when they are deploring or excusing the recognized imperfections of some fellow mortal: 'His analysis was not finished' or 'he was never analysed to the end.'

We must first of all decide what is meant by the ambiguous phrase 'the end of an analysis'. From a practical standpoint it is easy to answer. An analysis is ended when the analyst and the patient cease to meet each other for the analytic session. This happens when two conditions have been approximately fulfilled: first, that the patient shall no longer be suffering from his symptoms and shall have overcome his anxieties [*Ängste*][T] and his inhibitions; and secondly, that the analyst shall judge that so much repressed material has been made conscious, so much that was unintelligible has been explained, and so much internal resistance conquered, that there is no need to fear a repetition of the pathological processes concerned. If one is prevented by external difficulties from reaching this goal, it is better to speak of an *incomplete* analysis rather than of an *unfinished* one.

The other meaning of the 'end' of an analysis is much more ambitious. In this sense of it, what we are asking is whether the analyst has had such a far-reaching influence on the patient that no further change could be expected to take place in him if his analysis were continued. It is as though it were possible by means of analysis to attain a level of absolute
[220] psychical normality – a level, moreover, which we could feel confident would be able to remain stable, as though, perhaps, we had succeeded in resolving every one of the patient's repressions and in filling in all the gaps in his memory. We may first consult our experience to enquire whether such things do in fact happen, and then turn to our theory to discover whether there is any *possibility* of their happening.

Every analyst will have treated a few cases which have had this gratifying outcome. He has succeeded in clearing up the patient's neurotic disturbance, and it has not returned and has not been replaced by any other such disturbance. Nor are we without some insight into the determinants of these successes. The patient's ego [*Ich*][T] had not been noticeably altered[1] and the aetiology of his disturbance had been essentially traumatic. The aetiology of every neurotic disturbance is, after all, a mixed one. It is a question either of the drives [*Triebe*][T] being excessively strong – that is to say, recalcitrant to taming[2] by the ego – or of the effects of early (i.e. premature) traumas which the immature ego was unable to master. As a rule there is a combination of both factors, the constitutional and the accidental. The stronger the constitutional factor, the more readily will a trauma lead to a fixation and leave behind a developmental disturbance; the stronger the trauma, the more certainly will its injurious effects become manifest even when the drive situation is normal. There is no doubt that an aetiology of the traumatic sort offers by far the more favourable field for analysis. Only when a case is a predominantly traumatic one will analysis succeed in doing what it is so superlatively able to do; only then will it, thanks to having strengthened the patient's ego, succeed in replacing with a correct solution the inadequate decision made in his early life. Only in such cases can one speak of an analysis having been definitively ended. In them, analysis has done all that it should and does not need to be continued. It is true that, if the patient who has been restored in this way never produces another disorder calling for analysis, we do not know how much his immunity may not be due to a kind fate [*Schicksals*][T] which has spared him ordeals that are too severe.

A constitutional strength of drive and an unfavourable alteration of [221]
the ego acquired in its defensive struggle [*Abwehrkampf*][T] in the sense *Abwehr*
of its being dislocated and restricted – these are the factors which are prejudicial to the effectiveness of analysis and which may make its duration interminable. One is tempted to make the first factor – strength of drive – responsible as well for the emergence of the second – the alteration of the ego; but it seems that the latter too has an aetiology of its own. And, indeed, it must be admitted that our knowledge of these matters is as yet insufficient. They are only now becoming the subject of analytic study. In this field the interest of analysts seems to me to be

1 [The idea of an 'alteration of the ego' is discussed at length below particularly in Section V. See also the Editors' Note, p. 192 above.]

2 [This word is considered below, on p. 203.]

quite wrongly directed. Instead of an enquiry into how a cure by analysis comes about (a matter which I think has been sufficiently elucidated) the question should be asked of what are the obstacles that stand in the way of such a cure.

This brings me to two problems which arise directly out of analytic practice, as I hope to show by the following examples. A certain man, who had himself practised analysis with great success, came to the conclusion that his relations both to men and women – to the men who were his competitors and to the woman whom he loved – were nevertheless not free from neurotic impediments; and he therefore made himself the subject of an analysis by someone else whom he regarded as superior to himself.[1] This critical illumination of his own self [*Person*][T] had a completely successful result. He married the woman he loved and turned into a friend and teacher of his supposed rivals. Many years passed in this way, during which his relations with his former analyst also remained unclouded. But then, for no assignable external reason, trouble arose. The man who had been analysed became antagonistic to the analyst and reproached him for having failed to give him a complete analysis. The analyst, he said, ought to have known and to have taken into account the fact that a transference relation can never be purely positive; he should have given his attention to the possibilities of a negative transference. The analyst defended himself by saying that, at the time of the analysis, there was no sign of a negative transference.
[222] But even if he had failed to observe some very faint signs of it – which was not altogether ruled out, considering the limited horizon of analysis in those early days – it was still doubtful, he thought, whether he would have had the power to activate a topic (or, as we say, a 'complex') by merely pointing it out, so long as it was not currently active in the patient himself at the time. To activate it would certainly have required some unfriendly piece of behaviour in reality on the analyst's part. Furthermore, he added, not every good relation between an analyst and his subject during and after analysis was to be regarded as a transference; there were also friendly relations which were based on reality and which proved to be viable.

I now pass on to my second example, which raises the same problem. An unmarried woman, no longer young, had been cut off from life since puberty by an inability to walk, owing to severe pains in the legs. Her

1 [According to Ernest Jones this relates to Ferenczi, who was analysed by Freud for three weeks in October, 1914, and for another three weeks (with two sessions daily) in June, 1916. See Jones, 1957, 158, and 1955, 195 and 213. Cf. also Freud's obituary of Ferenczi (1933*c*), *RSE*, **22**, 242.]

condition was obviously of a hysterical nature, and it had defied many kinds of treatment. An analysis lasting three-quarters of a year removed the trouble and restored to the patient, an excellent and worthy person, her right to a share in life. In the years following her recovery she was consistently unfortunate. There were disasters in her family, and financial losses, and, as she grew older, she saw every hope of happiness in love and marriage vanish. But the one-time invalid stood up to all this valiantly and was a support to her family in difficult times. I cannot remember whether it was twelve or fourteen years after the end of her analysis that, owing to profuse haemorrhages, she was obliged to undergo a gynaecological examination. A myoma was found, which made a complete hysterectomy advisable. From the time of this operation, the woman became ill once more. She fell in love with her surgeon, wallowed in masochistic phantasies [*Phantasien*]^{T} about the fearful changes in her inside – phantasies with which she concealed her romance – and proved inaccessible to a further attempt at analysis. She remained abnormal to the end of her life. The successful analytic treatment took place so long ago that we cannot expect too much from it; it was in the earliest years of my work as an analyst. No doubt the patient's second illness may have sprung from the same source as her first one which had been successfully overcome: it may have been a different manifestation of the same repressed impulses [*Regungen*]^{T}, which the analysis had only incompletely resolved. But I am inclined to think that, were it not for the new trauma, there would have been no [223]
fresh outbreak of neurosis.

These two examples, which have been purposely selected from a large number of similar ones, will suffice to start a discussion of the topics we are considering. The sceptical, the optimistic and the ambitious will take quite different views of them. The first will say that it is now proved that even a successful analytic treatment does not protect the patient, who at the time has been cured, from falling ill later on of another neurosis – or, indeed, of a neurosis derived from the same drive root – that is to say, from a recurrence of his old trouble. The others will consider that this is not proved. They will object that the two examples date from the early days of analysis, twenty and thirty years ago, respectively; and that since then we have acquired deeper insight and wider knowledge, and that our technique has changed in accordance with our new discoveries. Today, they will say, we may demand and expect that an analytic cure shall prove permanent, or at least that if a patient falls ill again, his new illness shall not turn out to be a revival of his earlier

drive disturbance, manifesting itself in new forms. Our experience, they will maintain, does not oblige us to restrict so materially the demands that can be made upon our therapeutic method.

My reason for choosing these two examples is, of course, precisely because they lie so far back in the past. It is obvious that the more recent the successful outcome of an analysis is, the less utilizable it is for our discussion, since we have no means of predicting what the later history of the recovery will be. The optimists' expectations clearly presuppose a number of things which are not precisely self-evident. They assume, firstly, that there really is a possibility of disposing of a drive conflict (or, more correctly, a conflict between the ego and a drive) definitively and for all time; secondly, that while we are treating someone for one drive conflict we can, as it were, inoculate him against the possibility of any other such conflicts; and thirdly, that we have the power, for purposes of prophylaxis, to stir up a pathogenic conflict of this sort which is not betraying itself at the time by any indications, and that it is wise to do so. I throw out these questions without proposing to answer them now. Perhaps it may not be possible at present to give any certain answer to them at all.

[224] Some light may probably be thrown on them by theoretical considerations. But another point has already become clear: if we wish to fulfil the more exacting demands upon analytic therapy, our road will not lead us to, or by way of, a shortening of its duration.

III

An analytic experience which now extends over several decades, and a change which has taken place in the nature and mode of my activity, encourage me to attempt to answer the questions before us. In earlier days I treated quite a large number of patients, who, as was natural, wanted to be dealt with as quickly as possible. Of late years I have been mainly engaged in training analyses; a relatively small number of severe cases of illness remained with me for continuous treatment, interrupted, however, by longer or shorter intervals. With them, the therapeutic aim was no longer the same. There was no question of shortening the treatment; the purpose was radically to exhaust the possibilities of illness in them and to bring about a deep-going alteration of their personality.

Of the three factors which we have recognized as being decisive for the success or otherwise of analytic treatment – the influence of traumas, the constitutional strength of the drives and alterations of the

ego – what concerns us here is only the second, the strength of the drives. A moment's reflection raises a doubt whether the restrictive use of the adjective 'constitutional' (or 'congenital') is essential. However true it may be that the constitutional factor is of decisive importance from the very beginning, it is nevertheless conceivable that a reinforcement of drive coming later in life might produce the same effects. If so, we should have to modify our formula and say 'the strength of the drives *at the time*' instead of 'the *constitutional* strength of the drives'. The first of our questions [p. 202 above] was: 'Is it possible by means of analytic therapy to dispose of a conflict between a drive and the ego, or of a pathogenic drive demand upon the ego, permanently and definitively?' To avoid misunderstanding it is not unnecessary, perhaps, to explain more exactly what is meant by 'permanently disposing of a drive demand'. Certainly not 'causing the demand to disappear so that nothing more is ever heard from it again'. This is in general impossible, nor is it at all to be desired. No, we mean something else, something which may be roughly described as a 'taming'[1] of the drive. That is to say, the drive is brought completely into the harmony of the ego, becomes accessible to all the influences of the other trends in the ego and no longer seeks to go its independent way to satisfaction. If we are asked by what methods and means this result is achieved, it is not easy to find an answer. We can only say: 'So muss denn doch die Hexe dran!'[2] – the Witch Metapsychology. Without metapsychological speculation and theorizing – I had almost said 'phantasying' – we shall not get another step forward. Unfortunately, here as elsewhere, what our Witch reveals is neither very clear nor very detailed. We have only a single clue to start from – though it is a clue of the highest value – namely, the antithesis between the primary and the secondary processes; and to that antithesis I shall at this point turn. [225]

If now we take up our first question once more, we find that our new line of approach inevitably leads us to a particular conclusion. The question was whether it is possible to dispose of a drive conflict permanently and definitively – i.e. to 'tame' a drive demand in that fashion. Formulated in these terms, the question makes no mention at all of the

1 ['*Bändigung*.' Freud had used the word, among other places, in 'The Economic Problem of Masochism' (1924*c*) to describe the action by which the libido can make the death drive innocuous, *RSE*, **19**, 155 f. Much earlier, in Section 3 of Part III of the 'Project' of 1895, he had used it of the process by which painful memories cease to carry affect, owing to the intervention of the ego. (Freud, 1950*a*.)]

2 ['We must call the Witch to our help after all!'
Goethe, *Faust*, Part I, Scene 6.
Faust, in search of the secret of youth, unwillingly seeks the Witch's help.]

strength of the drive; but it is precisely on this that the outcome depends. Let us start from the assumption that what analysis achieves for neurotics is nothing other than what normal people bring about for themselves without its help. Everyday experience, however, teaches us that in a normal person any solution to a drive conflict only holds good for a particular strength of drive, or, more correctly, only for a particular
[226] relation between the strength of the drive and the strength of the ego.[1] If the strength of the ego diminishes, whether through illness or exhaustion, or from some similar cause, all the drives which have so far been successfully tamed may renew their demands and strive to obtain substitutive satisfactions in abnormal ways.[2] Irrefutable proof of this statement is supplied by our nightly dreams; they react to the sleeping attitude assumed by the ego with an awakening of drive demands.

The material on the other side [the strength of the drives] is equally unambiguous. Twice in the course of individual development certain drives are considerably reinforced: at puberty, and, in women, at the menopause. We are not in the least surprised if a person who was not neurotic before becomes so at these times. When his drives were not so strong, he succeeded in taming them; but when they are reinforced he can no longer do so. The repressions behave like dams against the pressure of water. The same effects which are produced by these two physiological reinforcements of drive may be brought about in an irregular fashion by accidental causes at any other period of life. Such reinforcements may be set up by fresh traumas, enforced frustrations [*Versagungen*][T], or the collateral influence of drives upon one another. The result is always the same, and it underlines the irresistible power [*Macht*][T] of the quantitative factor in the causation of illness.

I feel as though I ought to be ashamed of so much ponderous exposition, seeing that everything I have said has long been familiar and self-evident. It is a fact that we have always behaved as if we knew all this; but, for the most part, our theoretical concepts have neglected to attach the same importance to the *economic* line of approach as they
[227] have to the *dynamic* and *topographical* ones. My excuse is therefore that I am drawing attention to this neglect.[3]

1 Or, to be perfectly accurate, where that relation falls within certain limits.

2 Here we have a justification of the claim to aetiological importance of such non-specific factors as overwork, shock, etc. These factors have always been assured of general recognition, but have had to be pushed into the background precisely by psychoanalysis. It is impossible to define health except in metapsychological terms: i.e. by reference to the dynamic relations between the agencies of the mental apparatus which have been recognized – or (if that is preferred) inferred or conjectured – by us. [Early depreciation by Freud of the aetiological importance in neurosis of such factors as 'overwork' can be found as early as in Draft A in the Fliess papers, dating perhaps from 1892 (1950*a*), *RSE*, **1**, 206.]

3 [This same line of argument had been traced particularly clearly, in less technical language, in Chapter VII of *The Question of Lay Analysis* (1926*e*), ibid., **20**, 214–16.]

Before we decide on an answer to this question, however, we must consider an objection whose force lies in the fact that we are probably predisposed in its favour. Our arguments, it will be said, are all deduced from the processes which take place spontaneously between the ego and the drives, and they presuppose that analytic therapy can accomplish nothing which does not, under favourable and normal conditions, occur of itself. But is this really so? Is it not precisely the claim of our theory that analysis produces a state which never does arise spontaneously in the ego and that this newly created state constitutes the essential difference between a person who has been analysed and a person who has not? Let us bear in mind what this claim is based on. All repressions take place in early childhood; they are primitive defensive measures taken by the immature, feeble ego. In later years no fresh repressions are carried out; but the old ones persist, and their services continue to be made use of by the ego for mastering the drives. New conflicts are disposed of by what we call 'after-repression'.[1] We may apply to these infantile repressions our general statement that repressions depend absolutely and entirely on the relative strength of the forces [*Kräftverhältnis*][T] *Kraft* involved and that they cannot hold out against an increase in the strength of the drives. Analysis, however, enables the ego, which has attained greater maturity and strength, to undertake a revision of these old repressions; a few are demolished, while others are recognized but constructed afresh out of more solid material. These new dams are of quite a different degree of firmness from the earlier ones; we may be confident that they will not give way so easily before a rising flood of drive strength. Thus the real achievement of analytic therapy would be the subsequent [*nachträgliche*] correction of the original process of repression, a correction which puts an end to the dominance of the quantitative factor.

Thus far our theory, which we cannot give up except under irresistible [228] compulsion. And what does our *experience* have to say to this? Perhaps our experience is not yet wide enough for us to come to a settled conclusion. It confirms our expectations often enough, but not always. One has an impression that one ought not to be surprised if it should turn out in the end that the difference between a person who has not been analysed and the behaviour of a person after he has been analysed is not so thoroughgoing as we aim at making it and as we expect and maintain

1 ['*Nachverdrängung*.' See the metapsychological paper on 'Repression' (1915*d*), *RSE*, **14**, 136, where, however (as elsewhere at that period), the term used is '*Nachdrängen*', translated 'after-pressure'.]

it to be. If this is so, it would mean that analysis *sometimes* succeeds in eliminating the influence of an increase in drive, but not invariably, or that the effect of analysis is limited to increasing the power of resistance [*Widerstandskraft*] of the inhibitions, so that they are equal to much greater demands than before the analysis or if no analysis had taken place. I really cannot commit myself to a decision on this point, nor do I know whether a decision is possible at the present time.

There is, however, another angle from which we can approach this problem of the variability in the effect of analysis. We know that the first step towards attaining intellectual mastery of our environment is to discover generalizations, rules and laws which bring order into chaos. In doing this we simplify the world of phenomena; but we cannot avoid falsifying it, especially if we are dealing with processes of development and change. What we are concerned with is discerning a *qualitative* alteration, and as a rule in doing so we neglect, at any rate to begin with, a *quantitative* factor. In the real world, transitions and intermediate stages are far more common than sharply differentiated opposite states. In studying developments and changes we direct our attention solely to the outcome; we readily overlook the fact that such processes are usually more or less incomplete – that is to say, that they are in fact only partial alterations. A shrewd satirist of old Austria, Johann Nestroy,[1] once said: 'Every step forward is only half as big as it looks at first.' It is tempting to attribute a quite general validity to this malicious dictum. There are nearly always residual phenomena, a partial hanging back. When an open-handed Maecenas surprises us by some isolated trait of miserliness, or when a person who is consistently over-kind suddenly
[229] indulges in a hostile action, such 'residual phenomena' are invaluable for genetic [*genetische*][T] research. They show us that these praiseworthy and precious qualities are based on compensation and overcompensation which, as was to have been expected, have not been absolutely and fully successful. Our first account of the development of the libido was that an original oral phase gave way to a sadistic-anal phase and that this was in turn succeeded by a phallic-genital one. Later research has not contradicted this view, but it has corrected it by adding that these replacements do not take place all of a sudden but gradually, so that portions of the earlier organization always persist alongside of the more recent one, and even in normal development the transformation is never complete and residues of earlier libidinal fixations may still be retained in the final configuration. The same thing is to be seen in quite

1 [Freud had quoted the same remark in *The Question of Lay Analysis* (1926*e*), *RSE*, **20**, 172.]

other fields. Of all the erroneous and superstitious beliefs of mankind that have supposedly been surmounted there is not one whose residues do not live on among us today in the lower strata of civilized peoples [*Kulturvölker*][T] or even in the highest strata of cultural society [*Kulturgesellschaft*]. What has once come to life clings tenaciously to its existence. One feels inclined to doubt sometimes whether the dragons of primaeval days are really extinct. *Kultur*

Applying these remarks to our present problem, I think that the answer to the question of how to explain the variable results of our analytic therapy might well be that we, too, in endeavouring to replace repressions that are insecure with reliable ego-syntonic [*ichgerechte*][T] controls, do not always achieve our aim to its full extent – that is, do not achieve it thoroughly enough. The transformation is achieved, but often only partially: portions of the old mechanisms remain untouched by the work of analysis. It is difficult to prove that this is really so; for we have no other way of judging what happens but by the outcome which we are trying to explain. Nevertheless, the impressions one receives during the work of analysis do not contradict this assumption; indeed, they seem rather to confirm it. But we must not take the clarity of our own insight as a measure of the conviction which we produce in the patient. His conviction may lack 'depth', as one might say; it is always a question of the quantitative factor, which is so easily overlooked. If this is the correct answer to our question, we may say that analysis, in claiming to cure neuroses by ensuring control over drive, is always right in theory but not always right in practice. And this is because it does not always succeed in ensuring to a sufficient degree the [230] foundations on which a control of drive is based. The cause of such a partial failure is easily discovered. In the past, the quantitative factor of drive strength opposed the ego's defensive efforts; for that reason we called in the work of analysis to help; and now that same factor sets a limit to the efficacy of this new effort. If the strength of the drive is excessive, the mature ego, supported by analysis, fails in its task, just as the helpless ego failed formerly. Its control over drive is improved, but it remains imperfect because the transformation in the defensive mechanism is only incomplete. There is nothing surprising in this, since the power of the instruments with which analysis operates is not unlimited but restricted, and the final upshot always depends on the relative strength of the psychical agencies which are struggling with one another.

No doubt it is desirable to shorten the duration of analytic treatment, but we can only achieve our therapeutic purpose by increasing the

power of analysis to come to the assistance of the ego. Hypnotic influence seemed to be an excellent instrument for our purposes; but the reasons for our having to abandon it are well known. No substitute for hypnosis has yet been found. From this point of view we can understand how such a master of analysis as Ferenczi came to devote the last years of his life to therapeutic experiments, which, unhappily, proved to be in vain.

IV

The two further questions – whether, while we are treating one drive conflict, we can protect a patient from future conflicts, and whether it is feasible and expedient, for prophylactic purposes, to stir up a conflict which is not at the time manifest – must be treated together; for obviously the first task can only be carried out insofar as the second one is – that is, insofar as a possible future conflict is turned into an actual present one upon which influence is then brought to bear. This new way of stating the problem is at bottom only an extension of the earlier one. Whereas in the first instance we were considering how to guard against a return of the same conflict, we are now considering how to guard against its possible replacement by *another* conflict. This sounds a very
[231] ambitious proposal, but all we are trying to do is to make clear what limits are set to the efficacy of analytic therapy.

However much our therapeutic ambition may be tempted to undertake such tasks, experience flatly rejects the notion. If a drive conflict is not a currently active one, is not manifesting itself, we cannot influence it even by analysis. The warning that we should let sleeping dogs lie, which we have so often heard in connection with our efforts to explore the psychical underworld, is peculiarly inapposite when applied to the
Seele conditions of mental life [*Seelenlebens*]^{T}. For if the drives are causing disturbances, it is a proof that the dogs are not sleeping; and if they seem really to be sleeping, it is not in our power to awaken them. This last statement, however, does not seem to be quite accurate and calls for a more detailed discussion. Let us consider what means we have at our disposal for turning a drive conflict which is at the moment latent into one which is currently active. Obviously there are only two things that we can do. We can bring about situations in which the conflict does become currently active, or we can content ourselves with discussing it in the analysis and pointing out the possibility of its arising. The first of these two alternatives can be carried out in two ways: in reality, or in

the transference – in either case by exposing the patient to a certain amount of real suffering through frustration and the damming up of libido. Now it is true that we already make use of a technique of this kind in our ordinary analytic procedure. What would otherwise be the meaning of the rule that analysis must be carried out 'in a state of frustration'?[1] But this is a technique which we use in treating a conflict which is already currently active. We seek to bring this conflict to a head, to develop it to its highest pitch, in order to increase the driving force [*Triebkraft*] available for its solution. Analytic experience has taught us that the better is always the enemy of the good[2] and that in every phase of the patient's recovery we have to fight against his inertia, which is ready to be content with an incomplete solution.

If, however, what we are aiming at is a prophylactic treatment of drive conflicts that are not currently active but merely potential, it will not be enough to regulate sufferings which are already present in the patient [232] and which he cannot avoid. We should have to make up our minds to provoke fresh sufferings in him; and this we have hitherto quite rightly left to fate. We should receive admonitions from all sides against the presumption of vying with fate in subjecting poor human creatures to such cruel experiments. And what sort of experiments would they be? Could we, for purposes of prophylaxis, take the responsibility of destroying a satisfactory marriage, or causing a patient to give up a post upon which his livelihood depends? Fortunately, we never find ourselves in the position of having to consider whether such interventions in the patient's real life are justified; we do not possess the plenary powers which they would necessitate, and the subject of our therapeutic experiment would certainly refuse to cooperate in it. In practice, then, such a procedure is virtually excluded; but there are, besides, theoretical objections to it. For the work of analysis proceeds best if the patient's pathogenic experiences belong to the past, so that his ego can stand at a distance from them. In states of acute crisis analysis is to all intents and purposes unusable. The ego's whole interest is taken up by the painful reality and it withholds itself from analysis, which is attempting to go below the surface and uncover the influences of the past. To create a fresh conflict would thus only be to make the work of analysis longer and more difficult.

1 [See the paper on 'Transference Love' (1915*a*), *RSE*, **12**, 164 f., and the Budapest Congress paper (1919*a*), ibid., **17**, 156 ff.]

2 [The French proverb: '*le mieux est l'ennemi du bien.*']

It will be objected that these remarks are quite unnecessary. Nobody thinks of purposely conjuring up new situations of suffering in order to make it possible for a latent drive conflict to be treated. This would not be much to boast of as a prophylactic achievement. We know, for instance, that a patient who has recovered from scarlet fever is immune to a return of the same illness; yet it never occurs to a doctor to take a healthy person who may possibly fall ill of scarlet fever and infect him with scarlet fever in order to make him immune to it. The protective measure must not produce the same situation of danger as is produced by the illness itself, but only something very much slighter, as is the case with vaccination against smallpox and many other similar procedures. In analytic prophylaxis against drive conflicts, therefore, the only methods which come into consideration are the other two which we have mentioned: the artificial production of new conflicts in the transference (conflicts which, after all, lack the character of reality), and the [233] arousing of such conflicts in the patient's imagination by talking to him about them and making him familiar with their possibility.

I do not know whether we can assert that the first of these two milder procedures is altogether ruled out in analysis. No experiments have been particularly made in this direction. But difficulties at once suggest themselves, which do not throw a very promising light on such an undertaking. In the first place, the choice of such situations for the transference is very limited. The patients cannot themselves bring all their conflicts into the transference; nor is the analyst able to call out all their possible drive conflicts from the transference situation. He may make them jealous or cause them to experience disappointments in love; but no technical purpose is required to bring this about. Such things happen of themselves in any case in most analyses. In the second place, we must not overlook the fact that all measures of this sort would oblige the analyst to behave in an unfriendly way to the patient, and this would have a damaging effect upon the affectionate attitude – upon the positive transference – which is the strongest motive [*Motiv*][T] for the patient's taking a share in the joint work of analysis. Thus we should on no account expect very much from this procedure.

This therefore leaves only the one method open to us – the one which was in all probability the only one originally contemplated. We tell the patient about the possibilities of other drive conflicts, and we arouse his expectation that such conflicts may occur in him. What we hope is that this information and this warning will have the effect of activating in him one of the conflicts we have indicated, in a modest degree and yet

sufficiently for treatment. But this time experience speaks with no uncertain voice. The expected result does not come about. The patient hears our message, but there is no response. He may think to himself: 'This is very interesting, but I feel no trace of it.' We have increased his knowledge, but altered nothing else in him. The situation is much the same as when people read psychoanalytic writings. The reader is 'stimulated' only by those passages which he feels apply to himself – that is, which concern conflicts that are active in him at the time. Everything else leaves him cold. We can have analogous experiences, I think, when we give children sexual enlightenment. I am far from maintaining that this is a harmful or unnecessary thing to do, but it is clear that the prophylactic effect of this liberal measure has been greatly overestimated. After such enlightenment, children know something they did not know before, but they make no use of the new knowledge that has been presented to them. We come to see that they are not even in so great a hurry to sacrifice for this new knowledge the sexual theories which might be described as a natural growth and which they have constructed in harmony with, and dependence on, their imperfect libidinal organization – theories about the part played by the stork, about the nature of sexual intercourse and about the way in which babies are made. For a long time after they have been given sexual enlightenment they behave like primitive races who have had Christianity thrust upon them and who continue to worship their old idols in secret.[1] [234]

V

We started from the question of how we can shorten the inconveniently long duration of analytic treatment, and, still with this question of time in mind, we went on to consider whether it is possible to achieve a permanent cure or even to prevent future illness by prophylactic treatment. In doing so, we found that the factors which were decisive for the success of our therapeutic efforts were the influence of traumatic aetiology, the relative strength of the drives which have to be controlled, and something which we have called an alteration of the ego. [See pp. 202–3 above.] Only the second of these factors has been discussed by us in any detail, and in connection with it we have had occasion to recognize the paramount importance of the quantitative factor and to stress the claim of the metapsychological line of approach to be taken into account in any attempt at explanation.

1 [These reflections of Freud's on the sexual enlightenment of children may be compared with the less sophisticated ones in his early paper on the subject (1907*c*), *RSE*, **9**, 111 ff.]

Concerning the third factor, the alteration of the ego, we have as yet said nothing. When we turn our attention to it, the first impression we receive is that there is much to ask and much to answer here, and that what we have to say about it will prove to be very inadequate. This first
[235] impression is confirmed when we go further into the problem. As is well known, the analytic situation consists in our allying ourselves with the ego of the person under treatment, in order to subdue portions of his id [*Es*][T] which are uncontrolled – that is to say to include them in the synthesis of his ego. The fact that a cooperation of this kind habitually fails in the case of psychotics affords us a first solid footing for our judgement. The ego, if we are to be able to make such a pact with it, must be a normal one. But a normal ego of this sort is, like normality in general, an ideal fiction. The abnormal ego, which is unserviceable for our purposes, is unfortunately no fiction. Every normal person, in fact, is only normal on the average. His ego approximates to that of the psychotic in some part or other and to a greater or lesser extent; and the degree of its remoteness from one end of the series and of its proximity to the other will furnish us with a provisional measure of what we have so indefinitely termed an 'alteration of the ego'.

If we ask what is the source of the great variety of kinds and degrees of alteration of the ego, we cannot escape the first obvious alternative, that such alterations are either congenital or acquired. Of these, the second sort will be the easier to treat. If they are acquired, it will certainly have been in the course of development, starting from the first years of life. For the ego has to try from the very outset to fulfil its task of mediating between its id and the external world in the service of the
Lust pleasure principle [*Lustprinzips*][T], and to protect the id from the dangers of the external world. If, in the course of these efforts, the ego learns to adopt a defensive attitude towards its own id as well and to treat the latter's drive demands as external dangers, this happens, at any rate in part, because it understands that a satisfaction of drive would lead to conflicts with the external world. Thereafter, under the influence of education [*Erziehung*][T], the ego grows accustomed to removing the scene of the fight from outside to within and to mastering the *internal* danger before it has become an *external* one; and probably it is most often right in doing so. During this fight on two fronts – later there will be a third front as well[1] – the ego makes use of various procedures for fulfilling its task, which, to put it in general terms, is to avoid danger, anxiety and unpleasure [*Unlust*]. We call these procedures '*mechanisms*

1 [An oblique reference to the superego.]

of defence'. Our knowledge of them is not yet sufficiently complete. [236]
Anna Freud's book (1936) has given us a first insight into their multiplicity and many-sided significance.

It was from one of those mechanisms, repression, that the study of neurotic processes took its whole start. There was never any doubt that repression was not the only procedure which the ego could employ for its purposes. Nevertheless, repression is something quite peculiar and is more sharply differentiated from the other mechanisms than they are from one another. I should like to make this relation to the other mechanisms clear by an analogy, though I know that in these matters analogies never carry us very far. Let us imagine what might have happened to a book, at a time when books were not printed in editions but were written out individually. We will suppose that a book of this kind contained statements which in later times were regarded as undesirable – as, for instance, according to Robert Eisler (1929), the writings of Flavius Josephus must have contained passages about Jesus Christ which were offensive to later Christendom. At the present day, the only defensive mechanism to which the official censorship could resort would be to confiscate and destroy every copy of the whole edition. At that time, however, various methods were used for making the book innocuous. One way would be for the offending passages to be thickly crossed through so that they were illegible. In that case they could not be transcribed, and the next copyist of the book would produce a text which was unexceptionable but which had gaps in certain passages, and so might be unintelligible in them. Another way, however, if the authorities were not satisfied with this, but wanted also to conceal any indication that the text had been mutilated, would be for them to proceed to distort the text. Single words would be left out or replaced with others, and new sentences interpolated. Best of all, the whole passage would be erased and a new one which said exactly the opposite put in its place. The next transcriber could then produce a text that aroused no suspicion but which was falsified. It no longer contained what the author wanted to say; and it is highly probable that the corrections had not been made in the direction of truth.

If the analogy is not pursued too strictly, we may say that repression has the same relation to the other methods of defence as omission has to distortion of the text, and we may discover in the different forms of this falsification parallels to the variety of ways in which the ego is [237]
altered. An attempt may be made to raise the objection that the analogy goes wrong in an essential point, for the distortion of a text is the work

of a tendentious censorship, no counterpart to which is to be found in the development of the ego. But this is not so; for a tendentious purpose of this kind is to a great extent represented by the compelling force of the pleasure principle. The psychical apparatus is intolerant of unpleasure; it has to fend it off at all costs, and if the perception of reality entails unpleasure, that perception – that is, the truth – must be sacrificed. Where external dangers are concerned, the individual can help himself for some time by flight and by avoiding the situation of danger, until he is strong enough later on to remove the threat by actively altering reality. But one cannot flee from oneself; flight is no help against internal dangers. And for that reason the defensive mechanisms of the ego are condemned to falsify one's internal perception and to give one only an imperfect and distorted picture of one's id. In its relations to the id, therefore, the ego is paralysed by its restrictions or blinded by its errors; and the result of this in the sphere of psychical events can only be compared to being out walking in a country one does not know and without having a good pair of legs.

The mechanisms of defence serve the purpose of keeping off dangers. It cannot be disputed that they are successful in this; and it is doubtful whether the ego could do without them altogether during its development. But it is also certain that they may become dangers themselves. It sometimes turns out that the ego has paid too high a price for the services they render it. The dynamic expenditure necessary for maintaining them, and the restrictions of the ego which they almost invariably entail, prove a heavy burden on the psychical economy. Moreover, these mechanisms are not relinquished after they have assisted the ego during the difficult years of its development. No one individual, of course, makes use of all the possible mechanisms of defence. Each person uses no more than a selection of them. But these become fixated in his ego. They become regular modes of reaction of his character, which are repeated throughout his life whenever a situation occurs that is similar to the original one. This turns them into infantilisms, and they share the fate of so many institutions which attempt to keep themselves in exist-
[238] ence after the time of their usefulness has passed. 'Vernunft wird Unsinn, Wohltat Plage' as the poet complains.[1] The adult's ego, with its increased strength, continues to defend itself against dangers which no longer exist in reality; indeed, it finds itself compelled to seek out those situations in reality which can serve as an approximate substitute for the original danger, so as to be able to justify, in relation to them, its maintaining its habitual modes of reaction. Thus we can easily understand

1 ['Reason becomes unreason, kindness torment.' Goethe, *Faust*, Part I, Scene 4.]

how the defensive mechanisms, by bringing about an ever more extensive alienation from the external world and a permanent weakening of the ego, pave the way for, and encourage, the outbreak of neurosis.

At the moment, however, we are not concerned with the pathogenic role of the defensive mechanisms. What we are trying to discover is what influence the alteration of the ego which corresponds to them has upon our therapeutic efforts. The material for an answer to this question is given in the volume by Anna Freud to which I have already referred. The essential point is that the patient repeats these modes of reaction during the work of analysis as well, that he produces them before our eyes, as it were. In fact, it is only in this way that we get to know them. This does not mean that they make analysis impossible. On the contrary, they constitute half of our analytic task. The other half, the one which was first tackled by analysis in its early days, is the uncovering of what is hidden in the id. During the treatment our therapeutic work is constantly swinging backwards and forwards like a pendulum between a piece of id analysis and a piece of ego analysis. In the one case we want to make something from the id conscious, in the other we want to correct something in the ego. The crux of the matter is that the defensive mechanisms directed against former danger recur in the treatment as *resistances* against recovery. It follows from this that the ego treats recovery itself as a new danger.

The therapeutic effect depends on making conscious what is repressed, in the widest sense of the word, in the id. We prepare the way for this making conscious by interpretations and constructions,[1] but we have interpreted only for ourselves not for the patient so long as the ego holds on to its earlier defences and does not give up its resistances. Now these resistances, although they belong to the ego, are [239] nevertheless unconscious and in some sense separated off within the ego. The analyst recognizes them more easily than he does the hidden material in the id. One might suppose that it would be sufficient to treat them like portions of the id and, by making them conscious, bring them into connection with the rest of the ego. In this way, we should suppose, one half of the task of analysis would be accomplished; we should not reckon on meeting with a resistance against the uncovering of resistances. But what happens is this. During the work on the resistances the ego withdraws – with a greater or lesser degree of seriousness – from the agreement on which the analytic situation is founded. The ego ceases to support our efforts at uncovering the id; it opposes them,

1 [Cf. the paper on this subject (1937*d*), p. 233 ff. below.]

disobeys the fundamental rule of analysis, and allows no further derivatives of the repressed to emerge. We cannot expect the patient to have a strong conviction of the curative power of analysis. He may have brought along with him a certain amount of confidence in his analyst, which will be strengthened to an effective point by the factors of the positive transference which will be aroused in him. Under the influence of the unpleasurable impulses which he feels as a result of the fresh activation of his defensive conflicts, negative transferences may now gain the upper hand and completely annul the analytic situation. The patient now regards the analyst as no more than a stranger who is making disagreeable demands on him, and he behaves towards him exactly like a child who does not like the stranger and does not believe anything he says. If the analyst tries to explain to the patient one of the distortions made by him for the purposes of defence, and to correct it, he finds him uncomprehending and inaccessible to sound arguments. Thus we see that there *is* a resistance against the uncovering of resistances, and the defensive mechanisms really do deserve the name which we gave them originally, before they had been more closely examined. They are resistances not only to the making conscious of contents of the id, but also to the analysis as a whole, and thus to recovery.

The effect brought about in the ego by the defences can rightly be described as an 'alteration of the ego' if by that we understand a deviation from the fiction of a normal ego which would guarantee unshakeable loyalty to the work of analysis. It is easy, then, to accept
[240] the fact, shown by daily experience, that the outcome of an analytic treatment depends essentially on the strength and on the depth of root of these resistances that bring about an alteration of the ego. Once again we are confronted with the importance of the quantitative factor, and once again we are reminded that analysis can only draw upon definite and limited amounts of energy which have to be measured against the hostile forces. And it seems as if victory is, in fact, as a rule on the side of the big battalions.

VI

The next question we come to is whether every alteration of the ego – in our sense of the term – is acquired during the defensive struggles of the earliest years. There can be no doubt about the answer. We have no reason to dispute the existence and importance of original, innate distinguishing characteristics of the ego. This is made certain by the single

fact that each person makes a selection from the possible mechanisms of defence, that he always uses a few only of them and always the same ones [p. 214 above]. This would seem to indicate that each ego is endowed from the first with individual dispositions and trends, though it is true that we cannot specify their nature or what determines them. Moreover, we know that we must not exaggerate the difference between inherited and acquired characteristics into an antithesis; what was acquired by our forefathers certainly forms an important part of what we inherit. When we speak of an 'archaic heritage'[1] we are usually thinking only of the id and we seem to assume that at the beginning of the individual's life no ego is as yet in existence. But we shall not overlook the fact that id and ego are originally one; nor does it imply any mystical overvaluation of heredity if we think it credible that, even before the ego has come into existence, the lines of development, trends and reactions which it will later exhibit are already laid down for it. The psychological peculiarities of families, races and nations, even in their attitude to analysis, allow of no other explanation. Indeed, more than this: analytic experience has forced on us a conviction that even particular psychical contents, such as symbolism, have no other sources than hereditary transmission, and researches in various fields of social anthropology make it plausible to suppose that other, equally specialized precipitates left by early human development are also present in the archaic heritage. [241]

With the recognition that the properties of the ego which we meet with in the form of resistances can equally well be determined by heredity as acquired in defensive struggles, the topographical distinction between what is ego and what is id loses much of its value for our investigation. If we advance a step further in our analytic experience, we come upon resistances of another kind, which we can no longer localize and which seem to depend on fundamental conditions in the mental apparatus. I can give only a few examples of this type of resistance; the whole field of enquiry is still bewilderingly strange and insufficiently explored. We come across people, for instance, to whom we should be inclined to attribute a special 'adhesiveness of the libido'.[2] The processes which the treatment sets in motion in them are so much

1 [See an Editors' Note to Part I of the third essay in *Moses and Monotheism* (1939*a*), p. 93 *n.* 2 above.]

2 [The term occurs in Lecture XXII of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 306–7. This characteristic and the more generalized 'psychical inertia' discussed below are not always treated separately in Freud's earlier writings. A list of a number of passages in which the topics are touched upon is given in an Editors' footnote to 'A Case of Paranoia' (1915*f*), ibid., **14**, 269 *n.*]

slower than in other people because, apparently, they cannot make up
Besetzung their minds to detach libidinal cathexes [*Libidobesetzungen*][T] from one object and displace them on to another, although we can discover no special reason for this cathectic loyalty. One meets with the opposite type of person, too, in whom the libido seems particularly mobile; it enters readily upon the new cathexes suggested by analysis, abandoning its former ones in exchange for them. The difference between the two types is comparable to the one felt by a sculptor, according to whether he works in hard stone or soft clay. Unfortunately, in this second type the results of analysis often turn out to be very impermanent: the new cathexes are soon given up once more, and we have an impression, not of having worked in clay, but of having written on water. In the words of the proverb: 'Soon got, soon gone.'[1]

In another group of cases we are surprised by an attitude in our patients which can only be put down to a depletion of the plasticity, the capacity for change and further development, which we should ordin-
[242] arily expect. We are, it is true, prepared to find in analysis a certain amount of psychical inertia.[2] When the work of analysis has opened up new paths for a drive impulse, we almost invariably observe that the impulse does not enter upon them without marked hesitation. We have called this behaviour, perhaps not quite correctly, 'resistance from the id'.[3] But with the patients I here have in mind, all the mental processes
ablaufen [*Abläufe*][T], relationships and distributions of force are unchangeable, fixed and rigid. One finds the same thing in very old people, in which case it is explained as being due to what is described as force of habit or an exhaustion of receptivity – a kind of psychical entropy.[4] But we are dealing here with people who are still young. Our theoretical knowledge does not seem adequate to give a correct explanation of such types. Probably some temporal characteristics are concerned – some alterations of a rhythm of development in psychical life which we have not yet appreciated.

In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the

1 ['*Wie gewonnen, so zerronnen.*']

2 [See footnote 2, p. 217 above.]

3 [See Addendum A (*a*) to *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 141–2.]

4 [The same analogy occurs in a passage in the 'Wolf Man' case history (1918*b*), dealing with this same psychological characteristic. Ibid., **17**, 103–4.]

ultimate things which psychological research can learn about: the behaviour of the two primal drives, their distribution, mingling and defusion – things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the superego [*Über-Ich*][T]. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego's relation to the superego. But this is only the portion of it which is, as it were, psychically bound by the superego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work [243]
in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the drive to aggression or to destruction according to its aims, and which we trace back to the original death drive of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action[1] of the two primal drives – Eros and the death drive – never by one or the other alone, can we explain the rich multiplicity of the phenomena of life.

How parts of these two classes of drives combine to fulfil the various vital functions, under what conditions such combinations grow looser or break up, to what disturbances these changes correspond and with what feelings the perceptual scale of the pleasure principle replies to them – these are problems whose elucidation would be the most rewarding achievement of psychological research. For the moment we must bow to the superiority of the forces against which we see our efforts come to nothing. Even to exert a psychical influence on simple masochism is a severe tax upon our powers.

In studying the phenomena which testify to the activity of the destructive drive, we are not confined to observations on pathological

1 [The phrase was a favourite one of Freud's. It can be found, for instance, in the first paragraph of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 1. His liking for it reflects his loyalty to a 'fundamental dualistic point of view'. Cf. *The Ego and the Id* (1923*b*), ibid., **19**, 41, and p. 222 below.]

material. Numerous facts of normal mental life call for an explanation of this kind, and the sharper our eye grows, the more copiously they strike us. The subject is too new and too important for me to treat it as a side-issue in this discussion. I shall therefore content myself with selecting a few sample cases.

Here is one instance. It is well known that at all periods there have been, as there still are, people who can take as their sexual objects
[244] members of their own sex as well as of the opposite one, without the one trend interfering with the other. We call such people bisexuals, and we accept their existence without feeling much surprise about it. We have come to learn, however, that every human being is bisexual in this sense and that his libido is distributed, either in a manifest or a latent fashion, over objects of both sexes. But we are struck by the following point. Whereas in the first class of people the two trends have got on together without clashing, in the second and more numerous class they are in a state of irreconcilable conflict. A man's heterosexuality will not put up with any homosexuality, and *vice versa*. If the former is the stronger it succeeds in keeping the latter latent and forcing it away from satisfaction in reality. On the other hand, there is no greater danger for a man's heterosexual function than its being disturbed by his latent homosexuality. We might attempt to explain this by saying that each individual has only a certain quota of libido at his disposal, for which the two rival trends have to struggle. But it is not clear why the rivals do not always divide up the available quota of libido between them according to their relative strength, since they are able to do so in a number of cases. We are forced to the conclusion that the tendency to a conflict is something special, something which is newly added to the situation, irrespective of the quantity of libido. An independently emerging tendency to conflict of this sort can scarcely be attributed to anything but the intervention of an element of free aggressiveness.

If we recognize the case we are discussing as an expression of the destructive or aggressive drive, the question at once arises whether this view should not be extended to other instances of conflict, and, indeed, whether all that we know about psychical conflict should not be revised from this new angle. After all, we assume that in the course of man's development from a primitive state to a civilized one his aggressiveness undergoes a very considerable degree of internalization or turning inwards; if so, his internal conflicts would certainly be the proper equivalent for the external struggles which have then ceased. I am well aware that the dualistic theory according to which a drive to death or to

destruction or aggression claims equal rights as a partner with Eros as manifested in the libido has found little sympathy and has not really been accepted even among psychoanalysts. This made me all the more pleased when not long ago I came upon [*wiederfand*][t] this theory of mine in the writings of one of the great thinkers of ancient Greece. I am very ready to give up the prestige of originality for the sake of such a confirmation, especially as I can never be certain, in view of the wide extent of my reading in early years, whether what I took for a new creation might not be an effect of cryptomnesia.[1] [245]

Empedocles of Acragas (Girgenti),[2] born about 495 B.C., is one of the grandest and most remarkable figures in the history of Greek civilization. The activities of his many-sided personality pursued the most varied directions. He was an investigator and a thinker, a prophet and a magician, a politician, a philanthropist and a physician with a knowledge of natural science. He was said to have freed the town of Selinunte from malaria, and his contemporaries revered him as a god. His mind seems to have united the sharpest contrasts. He was exact and sober in his physical and physiological researches, yet he did not shrink from the obscurities of mysticism, and built up cosmic speculations of astonishingly imaginative boldness. Capelle compares him with Dr Faust 'to whom many a secret was revealed'.[3] Born as he was at a time when the realm of science was not yet divided into so many provinces, some of his theories must inevitably strike us as primitive. He explained the variety of things by the mixture of the four elements, earth, air, fire and water. He held that all nature was animate, and he believed in the transmigration of souls. But he also included in his theoretical body of knowledge such modern ideas as the gradual evolution of living creatures, the survival of the fittest and a recognition of the part played by chance (*τύχη*) in that evolution.

But the theory of Empedocles which especially deserves our interest is one which approximates so closely to the psychoanalytic theory of the drives that we should be tempted to maintain that the two are identical, if it were not for the difference that the Greek philosopher's theory is a cosmic phantasy while ours is content to claim biological validity. At the same time, the fact that Empedocles ascribes to the universe the

1 [Cf. some remarks on this subject in a paper by Freud on Josef Popper-Lynkeus (1923*f*), *RSE*, **19**, 263 and 265 *n*.]

2 I have based what follows on a work by Wilhelm Capelle (1935). [The Sicilian town is more commonly known as Agrigentum.]

3 ['*Dem gar manch Geheimnis wurde kund*.' Modified from a line in Faust's first speech. (Goethe, *Faust*, Part I, Scene 1.)]

[246] same animate nature as to individual organisms robs this difference of much of its importance.

The philosopher taught that two principles governed events in the life of the universe and in the life of the mind, and that those principles were everlastingly at war with each other. He called them *φιλία* (love) and *νεῖκος* (strife). Of these two powers – which he conceived of as being at bottom 'natural forces operating like drives, and by no means intelligences with a conscious purpose'[1] – the one strives to agglomerate the primal particles of the four elements into a single unity, while the other, on the contrary, seeks to undo all those fusions and to separate the primal particles of the elements from one another. Empedocles thought of the process of the universe as a continuous, never-ceasing alternation of periods, in which the one or the other of the two fundamental forces gains the upper hand, so that at one time love and at another strife puts its purpose completely into effect and dominates the universe, after which the other, vanquished, side asserts itself and in its turn defeats its partner.

The two fundamental principles of Empedocles – *φιλία* and *νεῖκος* – are, both in name and function, the same as our two primal drives, *Eros* and *destructiveness*, the first of which endeavours to combine what exists into ever-greater unities, while the second endeavours to dissolve those combinations and to destroy the structures to which they have given rise. We shall not be surprised, however, to find that, on its re-emergence after two and a half millennia, this theory has been altered in some of its features. Apart from the restriction to the biophysical field which is imposed on us, we no longer have as our basic substances the four elements of Empedocles; what is living has been sharply differentiated from what is inanimate, and we no longer think of the mingling and separation of particles of substance, but of the soldering together and defusion of drive components. Moreover, we have provided some sort of biological basis for the principle of 'strife' by tracing back our drive to destruction to the death drive, to the urge of what is living to return to an inanimate state. This is not to deny that an analogous drive[2] already existed earlier, nor, of course, to assert that a drive
[247] of this sort only came into existence with the emergence of life. And

1 Capelle (1935), 186.

2 [I.e. analogous to the death drive.]

no-one can foresee in what guise the nucleus of truth contained in the theory of Empedocles will present itself to later understanding.[1]

VII

In 1927, Ferenczi read an instructive paper on the problem of the termination of analyses.[2] It ends with a comforting assurance that 'analysis is not an endless process, but one which can be brought to a natural end with sufficient skill and patience on the analyst's part'.[3] The paper as a whole, however, seems to me to be in the nature of a warning not to aim at shortening analysis but at deepening it. Ferenczi makes the further important point that success depends very largely on the analyst's having learnt sufficiently from his own 'errors and mistakes' and having got the better of 'the weak points in his own personality'.[4] This provides an important supplement to our theme. Among the factors which influence the prospects of analytic treatment and add to its difficulties in the same manner as the resistances must be reckoned not only the nature of the patient's ego but the individuality of the analyst.

It cannot be disputed that analysts in their own personalities have not invariably [*durchwegs*][t] come up to the standard of psychical normality to which they wish to educate their patients. Opponents of analysis often point to this fact with scorn and use it as an argument to show the uselessness of analytic exertions. We might reject this criticism as making unjustifiable demands. Analysts are people who have learnt to practise a particular art; alongside of this, they may be allowed to be human beings like anyone else. After all, nobody maintains that a physician is incapable of treating internal diseases if his own internal organs are not sound; on the contrary, it may be argued that there are certain [248]
advantages in a man who is himself threatened with tuberculosis specializing in the treatment of persons suffering from that disease. But the cases are not on all fours. So long as he is capable of practising at all, a doctor suffering from disease of the lungs or heart is not handicapped either in diagnosing or treating internal complaints; whereas the

1 [Empedocles was mentioned once more by Freud in a footnote to Chapter II of his *Outline of Psychoanalysis* (1940*a* [1938]), p. 135 *n.* 3 above. – Freud made some further remarks on the destructive drive in a letter written shortly after this paper to Princess Marie Bonaparte. An extract from it appears in the Editors' Introduction to *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 58.]

2 [This was a paper read at the Innsbruck Psychoanalytical Congress in 1927. It was published in the following year.]

3 [Ferenczi, 1928; English trans., 1955, 86.]

4 [Ferenczi, loc. cit.]

special conditions of analytic work do actually cause the analyst's own defects to interfere with his making a correct assessment of the state of things in his patient and reacting to them in a useful way. It is therefore reasonable to expect of an analyst, as a part of his qualifications, a considerable degree of mental normality and correctness. In addition, he must possess some kind of superiority, so that in certain analytic situations he can act as a model for his patient and in others as a teacher. And finally we must not forget that the analytic relationship is based on a love of truth – that is, on a recognition of reality – and that it precludes any kind of sham or deceit.

Here let us pause for a moment to assure the analyst that he has our sincere sympathy in the very exacting demands he has to fulfil in carrying out his activities. It almost looks as if analysis were the third of those 'impossible' professions in which one can be sure beforehand of achieving unsatisfying results. The other two, which have been known much longer, are education and government.[1] Obviously we cannot demand that the prospective analyst should be a perfect being before he takes up analysis, in other words that only persons of such high and rare perfection should enter the profession. But where and how is the poor wretch to acquire the ideal qualifications which he will need in his profession? The answer is, in an analysis of himself, with which his preparation for his future activity begins. For practical reasons this analysis can only be short and incomplete. Its main object is to enable his teacher to make a judgement as to whether the candidate can be accepted for further training. It has accomplished its purpose if it gives the learner a firm conviction of the existence of the unconscious, if it enables him, when repressed material emerges, to perceive in himself things which would otherwise be incredible to him, and if it shows him a first sample of the technique which has proved to be the only effective one in analytic
[249] work. This alone would not suffice for his instruction; but we reckon on the stimuli that he has received in his own analysis not ceasing when it ends and on the processes of remodelling the ego continuing spontaneously in the analysed subject and making use of all subsequent experiences in this newly acquired sense. This does in fact happen, and insofar as it happens it makes the analysed subject qualified to be an analyst himself.

Unfortunately something else happens as well. In trying to describe this, one can only rely on impressions. Hostility on the one side and

1 [Cf. a similar passage in Freud's Preface to Aichhorn's *Wayward Youth* (Freud, 1925*f*), *RSE*, **19**, 279.]

partisanship on the other create an atmosphere which is not favourable to objective investigation. It seems that a number of analysts learn to make use of defensive mechanisms which allow them to divert the implications and demands of analysis from themselves (probably by directing them on to other people), so that they themselves remain as they are and are able to withdraw from the critical and corrective influence of analysis. Such an event may justify the words of the writer who warns us that when a man is endowed with power it is hard for him not to misuse it.[1] Sometimes, when we try to understand this, we are driven into drawing a disagreeable analogy with the effect of X-rays on people who handle them without taking special precautions. It would not be surprising if the effect of a constant preoccupation with all the repressed material which struggles for freedom in the human mind were to stir up in the analyst as well all the drive demands which he is otherwise able to keep under suppression. These, too, are 'dangers of analysis', though they threaten, not the passive but the active partner in the analytic situation; and we ought not to neglect to meet them. There can be no doubt how this is to be done. Every analyst should periodically – at intervals of five years or so – submit himself to analysis once more, without feeling ashamed of taking this step. This would mean, then, that not only the therapeutic analysis of patients but his own analysis would change from a terminable into an interminable task.

At this point, however, we must guard against a misconception. I am not intending to assert that analysis is altogether an endless business. Whatever one's theoretical attitude to the question may be, the termination of an analysis is, I think, a practical matter. Every experienced analyst will be able to recall a number of cases in which he has bidden [250] his patient a permanent farewell *rebus bene gestis*.[2] In cases of what is known as character analysis there is a far smaller discrepancy between theory and practice. Here it is not easy to foresee a natural end, even if one avoids any exaggerated expectations and sets the analysis no excessive tasks. Our aim will not be to rub off every peculiarity of human character for the sake of a schematic 'normality', nor yet to demand that the person who has been 'thoroughly analysed' shall feel no passions and develop no internal conflicts. The business of the analysis is to secure the best possible psychological conditions for the functions of the ego; with that it has discharged its task.

1 Anatole France, *La révolte des anges* [1914].

2 ['Things having gone well.']

VIII

Both in therapeutic and in character analyses we notice that two themes come into particular prominence and give the analyst an unusual amount of trouble. It soon becomes evident that a general principle is at work here. The two themes are tied to the distinction between the sexes; one is as characteristic of males as the other is of females. In spite of the dissimilarity of their content, there is an obvious correspondence between them. Something which both sexes have in common has been forced, by the difference between the sexes, into different forms of expression.

The two corresponding themes are, in the female, an *envy for the penis* – a positive striving to possess a male genital – and, in the male, a struggle against his passive or feminine attitude to another male. What is common to the two themes was singled out at an early date by psychoanalytic nomenclature as an attitude towards the castration complex. Subsequently Alfred Adler brought the term 'masculine protest' into current use. It fits the case of males perfectly; but I think that, from the start, 'repudiation of femininity' would have been the correct description of this remarkable feature in the psychical life of human beings. [Cf. Adler, 1910.]

In trying to introduce this factor into the structure of our theory, we must not overlook the fact that it cannot, by its very nature, occupy the same position in both sexes. In males the striving to be masculine is
[251] completely ego-syntonic from the first; the passive attitude, since it presupposes an acceptance of castration, is energetically repressed, and often its presence is only indicated by excessive overcompensations. In females, too, the striving to be masculine is ego-syntonic at a certain period – namely in the phallic phase, before the development to femininity has set in. But it then succumbs to the momentous process of repression whose outcome, as has so often been shown, determines the fortunes of a woman's femininity.[1] A great deal depends on whether a sufficient amount of her masculinity complex escapes repression and exercises a permanent influence on her character. Normally, large portions of the complex are transformed and contribute to the construction of her femininity: the unappeased[2] wish for a penis is destined to be converted into a wish for a baby and for a husband, who possesses a penis. It is strange, however, how often we find that the wish

1 [Cf., for instance, 'Female Sexuality' (1931*b*), *RSE*, **21**, 218 f.]

2 [Erroneously rendered as 'appeased' in the *SE* translation.]

for masculinity has been retained in the unconscious and, from out of its state of repression, exercises a disturbing influence.

As will be seen from what I have said, in both cases it is the attitude proper to the opposite sex which has succumbed to repression. I have already stated elsewhere[1] that it was Wilhelm Fliess who called my attention to this point. Fliess was inclined to regard the antithesis between the sexes as the true cause and primal motive force [*Urmotiv*] of repression. I am only repeating what I said then in disagreeing with his view, when I decline to sexualize repression in this way – that is, to explain it on biological grounds instead of on purely psychological ones.

The paramount importance of these two themes – in females the wish for a penis and in males the struggle against passivity – did not escape Ferenczi's notice. In the paper read by him in 1927 he made it a requirement that in every successful analysis those two complexes must have been mastered.[2] I should like to add that, speaking from my own experience, I think that in this Ferenczi was asking a very great deal. At no other point in one's analytic work does one suffer more from an oppressive feeling that all one's repeated efforts have been in vain, and from a suspicion that one has been 'preaching to the winds', than when one is trying to persuade a woman to abandon her wish for a penis on the ground of its being unrealizable or when one is seeking to convince a man that a passive attitude to men does not always signify castration and that it is indispensable in many relationships in life. The rebellious overcompensation of the male produces one of the strongest transference resistances. He refuses to subject himself to a father substitute, or to feel indebted to him for anything, and consequently he refuses to accept his recovery from the doctor. No analogous transference can arise from the female's wish for a penis, but it is the source of outbreaks of severe depression in her, owing to an internal conviction that the analysis will be of no use and that nothing can be done to help her. And we can only agree that she is right, when we learn that her strongest motive in coming for treatment was the hope that, after all, she might still obtain a male organ, the lack of which was so painful to her. [252]

But we also learn from this that it is not important in what form the

1 '"A Child is Being Beaten"' (1919*e*), *RSE*, **17**, 194 ff. [Actually Fliess is not mentioned by name in that paper.]

2 '. . . Every male patient must attain a feeling of equality in relation to the physician as a sign that he has overcome his fear of castration; every female patient, if her neurosis is to be regarded as fully disposed of, must have got rid of her masculinity complex and must emotionally accept without a trace of resentment the implications of her female role.' (Ferenczi, 1928, 8 [English trans., 1995, 84].)

resistance appears, whether as a transference or not. The decisive thing remains that the resistance prevents any change from taking place – that everything stays as it was. We often have the impression that with the wish for a penis and the masculine protest we have penetrated through all the psychological strata and have reached bedrock, and that thus our activities are at an end. This is probably true, since, for the psychical field, the biological field does in fact play the part of the underlying bedrock. The repudiation of femininity can be nothing else than a
Geschlecht biological fact, a part of the great riddle of sex [*Geschlechtlichkeit*][T].[1]
[253] It would be hard to say whether and when we have succeeded in mastering this factor in an analytic treatment. We can only console ourselves with the certainty that we have given the person analysed every possible encouragement to re-examine and alter his attitude to it.

1 We must not be misled by the term 'masculine protest' into supposing that what the man is repudiating is his passive attitude [as such] – what might be called the social aspect of femininity. Such a view is contradicted by an observation that is easily verifiable – namely that such men often display a masochistic attitude – a state that amounts to bondage – towards women. What they reject is not passivity in general, but passivity towards a male. In other words, the 'masculine protest' is, in fact, nothing else than castration anxiety. [The state of sexual 'bondage' in men had been alluded to by Freud in his paper on 'The Taboo of Virginity' (1918*a*), *RSE*, **11**, 184.]

CONSTRUCTIONS IN ANALYSIS

The present translation is a corrected and revised reprint of the one published in the *SE*.

This paper was published in December, 1937.

Though, as Freud remarks, constructions have received much less attention than interpretations in discussions of analytic technique, his own writings contain many allusions to them. There are two or three full-length examples of them in his case histories: in the 'Rat Man' analysis (1909*d*), *RSE*, **10**, 139 f. and 156 f., and in the 'Wolf Man' analysis (1918*b*). The whole latter case revolves around a construction; but the question is specifically discussed in Section V (ibid., **17**, 45 ff.). Constructions are also mentioned in the *Outline* (1940*a*), pp. 160–1 above. Finally, constructions played a large part in the case history of the homosexual girl (1920*a*), as is made plain in Section I (*RSE*, **18**, 143 f.).

The paper ends with a discussion of a question in which Freud was much interested at this period – the distinction between what he described as 'historical' and 'material' truth.

CONSTRUCTIONS IN ANALYSIS

I

It has always seemed to me to be greatly to the credit of a certain well-known man of science that he treated psychoanalysis fairly at a time when most other people felt themselves under no such obligation. On one occasion, nevertheless, he gave expression to an opinion upon analytic technique which was at once derogatory and unjust. He said that in giving interpretations to a patient we treat him upon the famous principle of 'Heads I win, tails you lose'.[1] That is to say, if the patient agrees with us, then the interpretation is right; but if he contradicts us, that is only a sign of his resistance, which again shows that we are right. In this way we are always in the right against the poor helpless wretch whom we are analysing, no matter how he may respond to what we put forward. Now, since it is in fact true that a 'No' from one of our patients is not as a rule enough to make us abandon an interpretation as incorrect, a revelation such as this of the nature of our technique has been most welcome to the opponents of analysis. It is therefore worthwhile to give a detailed account of how we are accustomed to arrive at an assessment of the 'Yes' or 'No' of our patients during analytic treatment – of their expression of agreement or of denial [*Widerspruchs*]. The practising analyst will naturally learn nothing in the course of this apologia that he does not know already.[2] [257]

It is familiar ground that the work of analysis aims at inducing the patient to give up the repressions [*Verdrängungen*][T] (using the word in the widest sense) belonging to his early development and to replace them with reactions of a sort that would correspond to a psychically mature condition. With this purpose in view he must be brought to

1 [In English in the original.]

2 [This discussion takes up earlier ones in Freud's paper on 'Negation' (1925*h*), *RSE*, **19**, 237 and 241. Cf. also a passage in the first section of the 'Dora' analysis (1905*e*), ibid., **7**, 51–2, and a footnote added to the same passage in 1923; also a footnote to Chapter I (D) of the 'Rat Man' analysis (1909*d*), ibid., **10**, 141 *n.* 2.]

Regung [258] recollect certain experiences and the affective impulses [*Affektregungen*][T] called up by them which he has for the time being forgotten. We know that his present symptoms and inhibitions [*Hemmungen*][T] are the consequences of repressions of this kind: thus that they are a substitute for these things that he has forgotten. What sort of material does he put at our disposal which we can make use of to put him on the way to recovering the lost memories? All kinds of things. He gives us fragments of these memories in his dreams, invaluable in themselves but seriously distorted as a rule by all the factors concerned in the formation of dreams. Again, he produces ideas [*Einfälle*][T], if he gives himself up to 'free association' ['*freien Assoziation*'], in which we can discover allusions to the repressed experiences and derivatives of the suppressed affective impulses as well as of the reactions against them. And, finally, there are hints of repetitions of the affects belonging to the repressed material to be found in actions performed by the patient, some fairly important, some trivial, both inside and outside the analytic situation. Our experience has shown that the relation of transference [*Übertragung*][T], which becomes established towards the analyst, is particularly calculated to favour the return of these emotional connections. It is out of such raw material – if we may so describe it – that we have to put together what we are in search of.

What we are in search of is a picture of the patient's forgotten years that shall be alike trustworthy and in all essential respects complete. But at this point we are reminded that the work of analysis consists of two quite different portions, that it is carried on in two separate localities, that it involves two people, to each of whom a distinct task is assigned. It may for a moment seem strange that such a fundamental fact should not have been pointed out long ago; but it will immediately be perceived that there was nothing being kept back in this, that it is a fact which is universally known and, as it were, self-evident and is merely being brought into relief here and separately examined for a particular purpose. We all know that the person who is being analysed has to be induced to remember something that has been experienced by him and repressed; and the dynamic determinants of this process are so interesting that the other portion of the work, the task performed by the analyst, has been pushed into the background. The analyst has neither experienced nor repressed any of the material under consideration; his task cannot be to remember anything. What then *is* his task? His task
[259] is to make out what has been forgotten from the traces which it has left behind or, more correctly, to *construct* it. The time and manner in which

he conveys his constructions to the person who is being analysed, as well as the explanations with which he accompanies them, constitute the link between the two portions of the work of analysis, between his own part and that of the patient.

His work of construction, or, if it is preferred, of reconstruction, resembles to a great extent an archaeologist's excavation of some dwelling place that has been destroyed and buried or of some ancient edifice. The two processes are in fact identical, except that the analyst works under better conditions and has more material at his command to assist him, since what he is dealing with is not something destroyed but something that is still alive – and perhaps for another reason as well. But just as the archaeologist builds up the walls of the building from the foundations that have remained standing, determines the number and position of the columns from depressions in the floor and reconstructs the mural decorations and paintings from the remains found in the debris, so does the analyst proceed when he draws his inferences from the fragments of memories, from the associations [*Assoziation*] and from the behaviour of the subject of the analysis. Both of them have an undisputed right to reconstruct by means of supplementing and combining the surviving remains. Both of them, moreover, are subject to many of the same difficulties and sources of error. One of the most ticklish problems that confronts the archaeologist is notoriously the determination of the relative age of his finds; and if an object makes its appearance in some particular level, it often remains to be decided whether it belongs to that level or whether it was carried down to that level owing to some subsequent disturbance. It is easy to imagine the corresponding doubts that arise in the case of analytic constructions.

The analyst, as we have said, works under more favourable conditions than the archaeologist since he has at his disposal material which can have no counterpart in excavations, such as the repetitions of reactions dating from infancy and all that is indicated by the transference in connection with these repetitions. But in addition to this it must be borne in mind that the excavator is dealing with destroyed objects of which large and important portions have quite certainly been lost, by mechanical violence, by fire and by plundering. No amount of effort can result in their discovery and lead to their being united with the [260]
surviving remains. The one and only course open is that of reconstruction, which for this reason can often reach only a certain degree of probability. But it is different with the psychical object whose early history the analyst is seeking to recover. Here we are regularly met by

a situation which with the archaeological object occurs only in such rare circumstances as those of Pompeii or of the tomb of Tut'ankhamun. All of the essentials are preserved; even things that seem completely forgotten are present somehow and somewhere, and have merely been buried and made inaccessible to the subject. Indeed, it may, as we know, be doubted whether any psychical structure can really be the victim of total destruction. It depends only upon analytic technique whether we shall succeed in bringing what is concealed completely to light. There are only two other facts that weigh against the extraordinary advantage which is thus enjoyed by the work of analysis: namely, that psychical objects are incomparably more complicated than the excavator's material ones and that we have insufficient knowledge of what we may expect to find, since their finer structure contains so much that is still mysterious. But our comparison between the two forms of work can go no further than this; for the main difference between them lies in the fact that for the archaeologist the reconstruction is the aim and end of his endeavours while for analysis the construction is only a preliminary labour.

II

It is not, however, a preliminary labour in the sense that the whole of it must be completed before the next piece of work can be begun, as, for instance, is the case with house-building, where all the walls must be erected and all the windows inserted before the internal decoration of the rooms can be taken in hand. Every analyst knows that things happen differently in an analytic treatment and that there both kinds of work are carried on side by side, the one kind being always a little ahead and the other following upon it. The analyst finishes a piece of construction and communicates it to the subject of the analysis so that it may work upon him; he then constructs a further piece out of the fresh material pouring in upon him, deals with it in the same way and proceeds in this
[261] alternating fashion until the end. If, in accounts of analytic technique, so little is said about 'constructions', that is because 'interpretations' [<u>'*Deutungen*'</u>][T] and their effects are spoken of instead. But I think that 'construction' is by far the more appropriate description. 'Interpretation' applies to something that one does to some single element of the material, such as an association [<u>*Einfall*</u>] or a parapraxis [<u>*Fehlleistung*</u>][T]. But it is a 'construction' when one lays before the subject of the analysis a piece of his early history that he has forgotten, in some such way as

this: 'Up to your *n*th year you regarded yourself as the sole and unlimited possessor of your mother; then came another baby and brought you grave disillusionment. Your mother left you for some time, and even after her reappearance she was never again devoted to you exclusively. Your feelings towards your mother became ambivalent, your father gained a new importance for you,' . . . and so on.

In the present paper our attention will be turned exclusively to this preliminary labour performed by constructions. And here, at the very start, the question arises of what guarantee we have while we are working on these constructions that we are not making mistakes and risking the success of the treatment by putting forward some construction that is incorrect. It may seem that no general reply can in any event be given to this question; but even before discussing it we may lend our ear to some comforting information that is afforded by analytic experience. For we learn from it that no damage is done if, for once in a way, we make a mistake and offer the patient a wrong construction as the probable historical truth. A waste of time is, of course, involved, and anyone who does nothing but present the patient with false combinations will neither create a very good impression on him nor carry the treatment very far; but a single mistake of the sort can do no harm.[1] What, in fact, occurs in such an event is rather that the patient remains as though he were untouched by what has been said and reacts to it with neither a 'Yes' nor a 'No'. This may possibly mean no more than that his reaction is postponed; but if nothing further develops we may conclude that we have made a mistake and we shall admit as much to the patient at some suitable opportunity without sacrificing any of our authority. Such an [262] opportunity will arise when some new material has come to light which allows us to make a better construction and so to correct our error. In this way the false construction drops out, as if it had never been made; and, indeed, we often get an impression as though, to borrow the words of Polonius, our bait of falsehood had taken a carp of truth. The danger of our leading a patient astray by suggestion, by persuading him to accept things which we ourselves believe but which he ought not to, has certainly been enormously exaggerated. An analyst would have had to behave very incorrectly before such a misfortune could overtake him; above all, he would have to blame himself with not allowing his patients to have their say. I can assert without boasting that such an abuse of 'suggestion' has never occurred in my practice.

It already follows from what has been said that we are not at all

1 [An example of an incorrect construction is mentioned at the beginning of Section III of the 'Wolf Man' case history (1918*b*), *RSE*, **17**, 17.]

inclined to neglect the indications that can be inferred from the patient's reaction when we have offered him one of our constructions. The point must be gone into in detail. It is true that we do not accept the 'No' of a person under analysis at its face value; but neither do we allow his 'Yes' to pass. There is no justification for accusing us of invariably twisting his remarks into a confirmation. In reality things are not so simple and we do not make it so easy for ourselves to come to a conclusion.

A plain 'Yes' from a patient is by no means unambiguous. It can indeed signify that he recognizes the correctness of the construction that has been presented to him; but it can also be meaningless, or can even deserve to be described as 'hypocritical', since it may be convenient for his resistance to make use of an assent in such circumstances in order to prolong the concealment of a truth that has not been discovered. The 'Yes' has no value unless it is followed by indirect confirmations, unless the patient, immediately after his 'Yes', produces new memories which complete and extend the construction. Only in such an event do we consider that the 'Yes' has dealt completely with the subject under discussion.[1]

A 'No' from a person in analysis is quite as ambiguous as a 'Yes', and is indeed of even less value. In some rare cases it turns out to be the
[263] expression of a legitimate dissent. Far more frequently it expresses a resistance which may have been evoked by the subject matter of the construction that has been put forward but which may just as easily have arisen from some other factor in the complex analytic situation. Thus, a patient's 'No' is no evidence of the correctness of a construction, though it is perfectly compatible with it. Since every such construction is an incomplete one, since it covers only a small fragment of the forgotten events, we are free to suppose that the patient is not, in fact, disputing what has been said to him but is basing his contradiction upon the part that has not yet been uncovered. As a rule he will not give his assent until he has learnt the whole truth – which often covers a very great deal of ground. So that the only safe interpretation of his 'No' is that it points to incompleteness; there can be no doubt that the construction has not told him everything.

It appears, therefore, that the direct utterances of the patient after he has been offered a construction afford very little evidence upon the question whether we have been right or wrong. It is of all the greater interest that there are indirect forms of confirmation which are in every

1 [Cf. a paragraph in Section VII of 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*), *RSE*, **19**, 104 f.]

respect trustworthy. One of these is a form of words that is used (as though by general agreement) with very little variation by the most different people: 'I didn't ever think' (or 'I shouldn't ever have thought') 'that' (or 'of that').[1] This can be translated without any hesitation into: 'Yes, you're right this time – about my *unconscious*.' Unfortunately this formula, which is so welcome to the analyst, reaches his ears more often after single interpretations than after he has produced an extensive construction. An equally valuable confirmation is implied (expressed this time positively) when the patient answers with an association [*Assoziation*] which contains something similar or analogous to the content of the construction. Instead of taking an example of this from an analysis (which would be easy to find but lengthy to describe) I prefer to give an account of a small extra-analytical experience which presents a similar situation so strikingly that it produces an almost comic effect. It concerned one of my colleagues who – it was long ago – had chosen me as a consultant in his medical practice. One day, however, he brought his young wife to see me, as she was causing him trouble. She refused on all sorts of pretexts to have sexual relations with him, and what he [264] expected of me was evidently that I should lay before her the consequences of her ill-advised behaviour. I went into the matter and explained to her that her refusal would probably have unfortunate results for her husband's health or would lay him open to temptations that might lead to a break-up of their marriage. At this point he suddenly interrupted me with the remark: 'The Englishman you diagnosed as suffering from a cerebral tumour has died too.' At first the remark seemed incomprehensible; the 'too' in his sentence was a mystery, for we had not been speaking of anyone else who had died. But a short time afterwards I understood. The man was evidently intending to confirm what I had been saying; he was meaning to say: 'Yes, you're certainly quite right. Your diagnosis was confirmed in the case of the other patient too.' It was an exact parallel to the indirect confirmations that we obtain in analysis from associations. I will not attempt to deny that there were other thoughts as well, put on one side by my colleague, which had a share in determining his remark.

Indirect confirmation from associations that fit in with the content of a construction – that give us a 'too' like the one in my story – provides a valuable basis for judging whether the construction is likely to be confirmed in the course of the analysis. It is particularly striking when,

1 [Almost exactly the same phrases occur at the end of the paper on 'Negation' (1925*h*), *RSE*, **19**, 241.]

by means of a parapraxis, a confirmation of this kind insinuates itself into a direct denial. I once published elsewhere a nice example of this.[1] The name 'Jauner' (a familiar one in Vienna) came up repeatedly in one of my patient's dreams without a sufficient explanation appearing in his associations. I finally put forward the interpretation that when he said 'Jauner' he probably meant 'Gauner' [swindler], whereupon he promptly replied: 'That seems to me too "*jewagt*" [instead of "*gewagt*" (far-fetched)].'[2] Or there was the other instance, in which, when I suggested to a patient that he considered a particular fee too high, he meant to deny the suggestion with the words 'Ten dollars mean nothing to me' but instead of dollars put in a coin of lower value and said 'ten shillings'.

[265] If an analysis is dominated by powerful factors that impose a negative therapeutic reaction,[3] such as a sense of guilt, a masochistic need for suffering or repugnance to receiving help from the analyst, the patient's behaviour after he has been offered a construction often makes it very easy for us to arrive at the decision that we are in search of. If the construction is wrong, there is no change in the patient; but if it is right or gives an approximation to the truth, he reacts to it with an unmistakable aggravation of his symptoms and of his general condition.

We may sum the matter up by asserting that there is no justification for the reproach that we neglect or underestimate the importance of the attitude taken up by those under analysis towards our constructions. We pay attention to them and often derive valuable information from them. But these reactions on the part of the patient are rarely unambiguous and give no opportunity for a final judgement. Only the further course of the analysis enables us to decide whether our constructions are correct or unserviceable. We do not pretend that an individual construction is anything more than a conjecture which awaits examination, confirmation or rejection. We claim no authority for it, we require no direct agreement from the patient, nor do we argue with him if at first he denies it. In short, we conduct ourselves on the model of a familiar figure in one of Nestroy's farces[4] – the manservant who has a single answer on his lips to every question or objection: 'It will all become clear in the course of future developments.'

1 [See footnote 2 below.]

2 [Chapter V of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 81. In vulgar speech the 'g' is often pronounced like the German 'j' (English 'y').]

3 [Cf. Chapter V of *The Ego and the Id* (1923*b*), ibid., **19**, 44.]

4 [*Der Zerrissene*.]

III

How this occurs in the process of the analysis – the way in which a conjecture of ours is transformed into the patient's conviction – this is hardly worth describing. All of it is familiar to every analyst from his daily experience and is intelligible without difficulty. Only one point requires investigation and explanation. The path that starts from the analyst's construction ought to end in the patient's recollection; but it does not always lead so far. Quite often we do not succeed in bringing the patient to recollect what has been repressed. Instead of that, if the [266] analysis is carried out correctly, we produce in him an assured conviction of the truth of the construction which achieves the same therapeutic result as a recaptured memory. The problem of what the circumstances are in which this occurs and of how it is possible that what appears to be an incomplete substitute should nevertheless produce a complete result – all of this is matter for a later enquiry.

I shall conclude this brief paper with a few remarks which open up a wider perspective. I have been struck by the manner in which, in certain analyses, the communication of an obviously apt construction has evoked in the patients a surprising and at first incomprehensible phenomenon. They have had lively recollections called up in them – which they themselves have described as 'ultra-clear'[1] – but what they have recollected has not been the event that was the subject of the construction but details relating to that subject. For instance, they have recollected with abnormal sharpness the faces of the people involved in the construction or the rooms in which something of the sort might have happened, or, a step further away, the furniture in such rooms – on the subject of which the construction had naturally no possibility of any knowledge. This has occurred both in dreams immediately after the construction had been put forward and in waking states resembling phantasies [*phantasieartigen*][T]. These recollections have themselves led *Phantasie* to nothing further and it has seemed plausible to regard them as the product of a compromise. The 'upward drive' ['*Auftrieb*'] of the repressed, stirred into activity by the putting forward of the construction, has striven to carry the important memory traces into

1 [The phenomenon here described seems to go back to observations made by Freud in connection with *The Psychopathology of Everyday Life* (1901*b*). See the long footnote, *RSE*, **6**, 11 f. *n.* 3. The present passage may even be an allusion to a particular episode narrated there, ibid., 228–9. Cf. also the still earlier papers on 'The Psychical Mechanism of Forgetfulness' (1898*b*), ibid., **3**, 284 f. and footnote 3, and 289–90, and on 'Screen Memories' (1899*a*), ibid., **3**, 303–4. In all these passages Freud uses the same word '*überdeutlich*', translated here 'ultra-clear'.]

consciousness; but a resistance has succeeded, not, it is true, in *stopping*
Verschiebung that movement, but in *displacing* [*verschieben*]T it on to adjacent objects of minor significance.

These recollections might have been described as hallucinations if a belief in their actual presence had been added to their clearness. The
[267] importance of this analogy seemed greater when I noticed that true hallucinations occasionally occurred in the case of other patients who were certainly not psychotic. My line of thought proceeded as follows. Perhaps it may be a general characteristic of hallucinations to which sufficient attention has not hitherto been paid that in them something that has been experienced in infancy and then forgotten returns – something that the child has seen or heard at a time when he could still hardly speak and that now forces its way into consciousness, probably distorted and displaced owing to the operation of forces [*Kräfte*]T that are opposed to this return. And, in view of the close relation between hallucinations and particular forms of psychosis, our line of thought may be carried still further. It may be that the delusions into which these hallucinations are so constantly incorporated may themselves be less independent of the upward drive of the unconscious and the return of the repressed than we usually assume. In the mechanism of a delusion we stress as a rule only two factors: the turning away from the real world and its motive forces [*Motive*]T on the one hand, and the influence exercised by wish fulfilment on the content of the delusion on the other. But may it not be that the dynamic process is rather that the turning away from reality is exploited by the upward drive of the repressed in order to force its content into consciousness, while the resistances stirred up by this process and the trend to wish fulfilment share the responsibility for the distortion and displacement of what is recollected? This is after all the familiar mechanism of dreams, which intuition has equated with madness from time immemorial.

This view [*Auffassung*]T of delusions is not, I think, entirely new, but it nevertheless emphasizes a point of view which is not usually brought into the foreground. The essence of it is that there is not only *method* in madness, as the poet has already perceived,[1] but also a fragment of *historical truth*; and it is plausible to suppose that the compulsive belief attaching to delusions derives its strength precisely from infantile sources of this kind. All that I can produce today in support of this theory are reminiscences, not fresh impressions. It would probably be

1 [Polonius in Shakespeare's *Hamlet*, Act II, Scene 2: 'Though this may be madness, yet there's method in it.']

worthwhile to make an attempt to study cases of the disorder in question on the basis of the hypotheses that have been here put forward and also to carry out their treatment on those same lines. The vain effort would be abandoned of convincing the patient of the error of his delusion and of its contradiction of reality; and, on the contrary, the recognition of its kernel of truth would afford common ground upon which the therapeutic work could develop. That work would consist in liberating the fragment of historical truth from its distortions and its attachments [*Anlehnungen*][T] to the actual present day and in leading it back to the point in the past to which it belongs. The transposing of material from a forgotten past on to the present or on to an expectation of the future is indeed a habitual occurrence in neurotics no less than in psychotics. Often enough, when a neurotic is led by an anxiety state [*Angstzustand*][T] to expect the occurrence of some terrible event, he is in fact merely under the influence of a repressed memory (which is seeking to enter consciousness but cannot become conscious) that something which was at that time terrifying [*Schreckliches*] did really happen. I believe that we should gain a great deal of valuable knowledge from work of this kind upon psychotics even if it led to no therapeutic success. [268] *Angst*

I am aware that it is of small service to handle so important a subject in the cursory fashion that I have here employed. But nonetheless I have not been able to resist the seduction of an analogy. The delusions of patients appear to me to be the equivalents of the constructions which we build up in the course of an analytic treatment – attempts at explanation and cure, though it is true that these, under the conditions of a psychosis, can do no more than replace the fragment of reality that is being disavowed [*verleugnet*][T] in the present with another fragment that had already been disavowed in the remote past. It will be the task of each individual investigation to reveal the intimate connections between the material of the present disavowal and that of the original repression. Just as our construction is effective only because it recovers a fragment of lost experience, so the delusion owes its convincing power to the element of historical truth which it inserts in the place of the rejected reality. In this way a proposition which I originally asserted only of hysteria would apply also to delusions – namely, that those who are subject to them are suffering from their own reminiscences.[1] I never intended by this short formula to dispute the complexity of the causation of the illness or to exclude the operation of many other factors. *Verleugnung*

1 [Cf. the Breuer & Freud 'Preliminary Communication' (1893*a*), *RSE*, **2**, 7.]

[269] If we consider mankind as a whole and substitute it for the single human individual, we discover that it too has developed delusions which are inaccessible to logical criticism and which contradict reality. If, in spite of this, they are able to exert an extraordinary power over men, investigation leads us to the same explanation as in the case of the single individual. They owe their power to the element of *historical truth* which they have brought up from the repression of the forgotten and primaeval past.[1]

1 [The topic of the last few paragraphs ('historical' truth) was very much in Freud's mind at this period, and this was his first long discussion of it. A full list of other references to it can be found in a footnote to the section of *Moses and Monotheism* (1939*a*) dealing with the same question (p. 118 *n.* above).]

SPLITTING OF THE EGO IN THE PROCESS OF DEFENCE

The present translation is a revised and corrected reprint of the *SE* version.

The manuscript of this important paper, published posthumously, is dated January 2, 1938, and, according to Ernest Jones (1957, 255), it was 'written at Christmas, 1937'. In all previous (German and English) editions, this work is described as 'unfinished'. However, the careful examination of the original manuscript by Ilse Grubrich-Simitis (1993, 275–6; trans., 216–17) leaves this question open.

The paper carries further than before the investigation of the ego and its behaviour in difficult circumstances. Two interrelated topics are involved, both of which had latterly been occupying Freud's mind: the notion of the act of 'disavowal' ('*Verleugnung*') and the notion of that act's resulting in a 'splitting' of the ego. 'Disavowal' was usually discussed by Freud, as it is here, in connection with the castration complex. It emerged, for instance, in the paper on 'The Infantile Genital Organization' (1923*e*), *RSE*, **19**, 133, where an Editors' footnote gives a number of references to other appearances of the term. One of these is in the short study of 'Fetishism' (1927*e*), ibid., **21**, 140–1, to which the paper before us may be regarded as a sequel. For in that study the splitting of the ego consequent on disavowal was emphasized. (It had been hinted at already in 'Neurosis and Psychosis' (1924*b*), ibid., **19**, 144–5.)

[274] Freud took up the subject of the present paper again a little later, in the last two or three pages of Chapter VIII of his *Outline of Psychoanalysis* (1940*a* [1938]), pp. 182–4 above. He there, however, extends the application of the idea of a splitting of the ego beyond the cases of fetishism and of the psychoses to neuroses in general. Thus the topic links up with the wider question of the 'alteration of the ego' which is invariably brought about by the processes of defence. This, again, was something with which Freud had dealt recently – in his technical paper on 'Analysis Terminable and Interminable' (1937*c*, especially in Section V; see above) – but which leads us back to very early times, to the second paper on the neuropsychoses of defence (1896*b*), *RSE*, **3**, 192 f., and to the even earlier Draft K of the Fliess correspondence (1950*a*), ibid., **1**, 248 ff.

SPLITTING OF THE EGO IN THE PROCESS OF DEFENCE

I find myself for a moment in the interesting position of not knowing whether what I have to say should be regarded as something long familiar and obvious or as something entirely new and puzzling. But I am after all[1] inclined to think the latter. [275]

I have at last been struck by the fact that the ego [*Ich*][T] of a person whom we know as a patient in analysis must, dozens of years earlier, when it was young, have behaved in a remarkable manner in certain particular situations of pressure. We can assign in general and somewhat vague terms the conditions under which this comes about, by saying that it occurs under the influence of a psychical trauma. I prefer to select a single sharply defined special case, though it certainly does not cover all the possible modes of causation.

Let us suppose, then, that a child's ego is under the sway of a powerful drive demand [*Triebanspruchs*][T] which it is accustomed to satisfy and that it is suddenly frightened [*geschreckt*] by an experience which teaches it that the continuance of this satisfaction will result in an almost intolerable real danger. It must now decide either to recognize the real danger, give way to it and renounce the drive satisfaction, or to disavow [*verleugnen*][T] reality and make itself believe that there is no reason for fear [*Fürchten*], so that it may be able to retain the satisfaction. Thus there is a conflict between the demand by the drive and the prohibition by reality. But, in fact, the child takes neither course, or rather he takes both simultaneously, which comes to the same thing. He replies to the conflict with two contrary reactions, both of which are valid and effective. On the one hand, with the help of certain mechanisms he rejects reality and refuses to accept any prohibition; on the other hand, in the same breath he recognizes the danger of reality, takes over the fear [*Angst*][T] of that danger as a pathological symptom and tries subsequently to divest himself of the fear. It must be confessed that this is a very

Trieb

Verleugnung

1 [The 'after all' (and the corresponding '*doch*' in the German) were omitted in the previous editions (Grubrich-Simitis, 1993, 275; trans., 217).]

ingenious solution to the difficulty. Both of the parties to the dispute obtain their share: the drive is allowed to retain its satisfaction and
[276] proper respect is shown to reality. But everything has to be paid for in one way or another, and this success is achieved at the price of a rift in the ego which never heals but which increases as time goes on. The two contrary reactions to the conflict persist as the centre point of a splitting of the ego. The whole process seems so strange to us because we take for granted the synthetic nature of the processes of the ego.[1] But we are clearly at fault in this. The synthetic function of the ego, though it is of such extraordinary importance, is subject to particular conditions and is liable to a whole number of disturbances.

It will assist if I introduce an individual case history into this schematic disquisition. A little boy, while he was between three and four years of age, had become acquainted with the female genitals through being seduced by an older girl. After these relations had been broken off, he carried on the sexual stimulation set going in this way by zealously practising manual masturbation; but he was soon caught at it by his energetic nurse and was threatened with castration, the carrying out of which was, as usual, ascribed to his father. There were thus present in this case conditions calculated to produce a tremendous effect of fright. A threat of castration by itself need not produce a great impression. A child will refuse to believe in it, for he cannot easily imagine the possibility of losing such a highly prized part of his body. His [earlier] sight of the female genitals might have convinced our child of that possibility. But he drew no such conclusion from it, since his disinclination to doing so was too great and there was no motive present which could compel him to. On the contrary, whatever uneasiness he may have felt was calmed by the reflection that what was missing would yet make its appearance: she would grow one (a penis) later. Anyone who has observed enough small boys will be able to recollect having come across some such remark at the sight of a baby sister's genitals. But it is different if both factors are present together. In that case the threat revives the memory of the perception which had hitherto been regarded as harmless and finds in that memory a dreaded confirmation. The little boy now thinks he understands why the girl's genitals showed no sign
[277] of a penis and no longer ventures to doubt that his own genitals may meet with the same fate. Thenceforward he cannot help believing in the reality of the danger of castration.

1 [See, for instance, a passage in Lecture XXXI of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 68, and an Editors' footnote there, which gives a number of other references.]

The usual result of the fright of castration, the result that passes as the normal one, is that, either immediately or after some considerable struggle, the boy gives way to the threat and obeys the prohibition either wholly or at least in part (that is, by no longer touching his genitals with his hand). In other words, he gives up, in whole or in part, the satisfaction of the drive. We are prepared to hear, however, that our present patient found another way out. He created a substitute for the penis which he missed in females – that is to say, a fetish. In so doing, it is true that he had disavowed reality, but he had saved his own penis. So long as he was not obliged to acknowledge that females have lost their penis, there was no need for him to believe the threat that had been made against him: he need have no fears for his own penis, so he could proceed with his masturbation undisturbed. This behaviour on the part of our patient strikes us forcibly as being a turning away from reality – a procedure which we should prefer to reserve for psychoses. And it is in fact not very different. Yet we will suspend our judgement, for upon closer inspection we shall discover a not unimportant distinction. The boy did not simply contradict his perceptions and hallucinate a penis where there was none to be seen; he effected no more than a displacement of value – he transferred [*übertragen*][T] the importance of the penis to another part of the body, a procedure in which he was assisted by the mechanism of regression (in a manner which need not here be explained). This displacement [*Verschiebung*][T], it is true, related only to the female body; as regards his own penis nothing was changed.

Übertragung

This way of dealing with reality, which almost deserves to be described as artful [*kniffige*][t], was decisive as regards the boy's practical behaviour. He continued with his masturbation as though it implied no danger to his penis; but at the same time, in complete contradiction to his apparent boldness or indifference, he developed a symptom which showed that he nevertheless did recognize the danger. He had been threatened with being castrated by his father, and immediately afterwards, simultaneously with the creation of his fetish, he developed an intense fear of his father punishing him, which it required the whole force of his masculinity to master and overcompensate. This fear of his father, too, was silent on the subject of castration: by the help of regression to an oral phase, it assumed the form of a fear of being eaten by his father. At this point it is impossible to forget a primitive fragment of Greek mythology which tells how Kronos, the old Father God, swallowed his children and sought to swallow his youngest son Zeus like the rest, and how Zeus was saved by the craft of his mother and later on

[278]

castrated his father. But we must return to our case history and add that the boy produced yet another symptom, though it was a slight one, which he has retained to this day. This was an anxious susceptibility against either of his little toes being touched, as though, in all the to and fro between disavowal and acknowledgement, it was nevertheless castration that found the clearer expression.[1]

1 [All previous editions end in a row of dots, which implies that the work was unfinished. Nothing analogous exists in the original manuscript (Grubrich-Simitis, 1993, 275–6).]

Some particulars of the periodical in which this appeared have been given by Arthur Koestler (1954, 406 ff.), who was editing it at the time we are concerned with. It was published in Paris, and he described it as 'a German *émigré* weekly'. It started publication in the autumn of 1938 and ceased some eighteen months later. Koestler was in charge of it for the first few months of its existence. The particular issue in which Freud's article appeared was an 'Anglo-German' one, printed in both languages, and Koestler relates that he came to London to persuade Freud to contribute to it. The periodical is now difficult to obtain, and we are much indebted to K. R. Eissler, of the Sigmund Freud Archives, for providing James Strachey with photostats of Freud's original manuscript, of the printed article and of the contemporary, anonymous, and very free, translation.

This article, it will be seen, consists almost wholly of a quotation from a source which Freud declares that he can no longer trace. It has been suggested, with some plausibility (cf. Ernest Jones, 1957, 256), that the quotation is, in fact, by Freud himself, who chose an indirect manner of expressing some rather uncongenial

views. There is in any case a strong kinship between much of what is contained here and opinions put forward by Freud elsewhere, particularly in *Moses and Monotheism* (1939*a*), which he had only recently completed. (See, for instance, the discussions of the Jewish character in Part I (D) and Part II (A) of the third essay.) And again, the plea, made so forcibly here, that protests against the persecution of the Jews should be made by *non-Jews* appears as well in Freud's letter to *Time and Tide* (1938*c*), published only a day later than the present article (p. 277 below).

[290]

A COMMENT ON ANTI-SEMITISM

In the course of examining the remarks in the press and in literature [291]
provoked by the recent persecutions of the Jews, I came upon one essay which struck me as so unusual that I made a précis of it for my own use. What its author wrote was approximately as follows:

'By way of preface I must explain that I am not a Jew and therefore I am not driven into making these observations by any egoistic concern. Yet I have felt a lively interest in the anti-Semitic excesses of today and have directed my particular attention to the protests against them. These protests come from two directions – ecclesiastical and secular – the former in the name of religion, the latter appealing to the claims of humanity. The former were scanty and came late; but they *did* come in the end, and even His Holiness the Pope raised his voice. I confess that there was something I missed in the demonstrations coming from *both* sides – something at their beginning and something else at their end. I will try now to supply it.

'All these protests, I think, might be preceded by a particular introduction, which would run: "Well, it's true, *I* don't like Jews either. In some sort of way they seem strange to me and antipathetic. They have many disagreeable qualities and great defects. I think, too, that the influence they have had on us and our affairs has been predominantly detrimental. Their race, compared with our own, is obviously an inferior one; all their activities argue in favour of that." And after this what these protests do in fact contain could follow *without any discrepancy*: "But we profess a religion of love. We ought to love even our enemies as ourselves. We know that the Son of God gave His life on earth to redeem *all* men from the burden of sin. He is our model, and it is therefore sinning against His intention and against the command of the Christian religion if we consent to Jews being insulted, ill-treated, robbed and plunged into misery. We ought to protest against this, irrespectively of how much or how little the Jews deserve such treatment." The secular [292]
writers who believe in the gospel of humanity protest in similar terms.

'I confess that I have not been satisfied by any of these demonstrations. Apart from the religion of love and humanity there is also a religion of truth, and it has come off badly in these protests. But the truth is that for long centuries we have treated the Jewish people unjustly and that we are continuing to do so by judging them unjustly. Any one of us who does not start by admitting our guilt has not done his duty in this. The Jews are not worse than we are; they have somewhat other characteristics and somewhat other faults, but on the whole we have no right to look down on them. In some respects, indeed, they are our superiors. They do not need so much alcohol as we do in order to make life tolerable; crimes of brutality, murder, robbery and sexual violence are great rarities among them; they have always set a high value on intellectual achievement and interests; their family life is more intimate; they take better care of the poor; charity is a sacred duty to them. Nor can we call them in any sense inferior. Since we have allowed them to cooperate in our cultural tasks, they have acquired merit by valuable contributions in all the spheres of science, art and technology, and they have richly repaid our tolerance. So let us cease at last to hand them out favours when they have a claim to justice.'

It was natural that such determined partisanship from someone who was not a Jew should have made a deep impression on me. But now I have a remarkable confession to make. I am a very old man and my memory is no more what it was. I can no longer recall where I read the essay of which I made the précis nor who it was who was its author. Perhaps one of the readers of this periodical will be able to come to my help?

A whisper has just reached my ears that what I probably had in mind was Count Heinrich Coudenhove-Kalergi's book *Das Wesen des Antisemitismus* ['The Essence of Anti-Semitism'], which contains precisely what the author I am in search of missed in the recent protests, and more besides. I know that book. It appeared first in 1901 and was reissued by his son [Count Richard Coudenhove-Kalergi] in 1929 with an admirable introduction. But it cannot be that. What I am thinking of
[293] is a shorter pronouncement and one of very recent date. Or am I altogether at fault? Does nothing of the kind exist? And has the work of the two Coudenhoves had no influence on our contemporaries?[1]

SIGM. FREUD

1 [A later work by the younger Coudenhove in favour of the Pan-European movement appeared in an English translation in 1953 with a preface by Sir Winston Churchill.]

SOME ELEMENTARY LESSONS IN PSYCHO-ANALYSIS

(1940 [1938])

EDITORS' NOTE

SOME ELEMENTARY LESSONS IN PSYCHO-ANALYSIS

GERMAN EDITIONS

1940 *Int. Z. Psychoan. Imago*, **25** (1), 21–2. (In part.) [280]
1941 *GW*, **17**, 141–7. (Complete.)

ENGLISH TRANSLATIONS

1940 *Int. J. Psycho-Anal.*, **21** (1), 83–4. (In part.) (Tr. James Strachey.)
1950 *CP*, **5**, 376–82. (Complete. Same translator.)
1964 *SE*, **23**, 281–6. (Revised reprint.)

The present translation is a revised and corrected reprint of the *SE* version. The original part-publications were as a footnote to the first German issue of the *Outline of Psychoanalysis* (1940*a* [1938]) and as an Appendix to the first English translation of that work. The textual footnotes appended to this revised edition derive from Ilse Grubrich-Simitis's (1993, 286–8; trans., 226–8) examination of the original manuscript.

This was Freud's very last work. The title of the original is in English. It was written in London, and the manuscript is dated October 20, 1938. But it remained a fragment. A draft of the *Outline* had been completed early in the previous September – a very much larger and more important work – and this was a new and different approach to the same problem. Cf. a fuller discussion in the Editors' Note to the *Outline*, p. 128 above.

SOME ELEMENTARY LESSONS IN PSYCHO-ANALYSIS

An author who sets out to introduce some branch of knowledge – or, to put it more modestly, some branch of research – to an uninstructed public must clearly make his choice between two methods or techniques. [281]

It is possible to start off from what every reader knows (or thinks he knows) and regards as self-evident, without in the first instance contradicting him. An opportunity will soon occur for drawing his attention to facts in the same field, which, though they are known to him, he has so far neglected or insufficiently appreciated. Beginning from these, one can introduce further facts to him of which he has *no* knowledge and so prepare him for the necessity of going beyond his earlier judgements, of seeking new points of view and of taking new hypotheses into consideration. In this way one can get him to take a part in building up a new theory about the subject and one can deal with his objections to it during the actual course of the joint work. A method of this kind might well be called *genetic* [*genetischen*][T]. It follows the path along which the investigator himself has travelled earlier. In spite of all its advantages, it has the defect of not making a sufficiently striking effect upon the learner. He will not be nearly so much impressed by something which he has watched coming into existence and passing through a slow and difficult period of growth as he would be by something that is presented to him ready-made as an apparently self-contained whole.

It is precisely this last effect which is produced by the alternative method of presentation. This other method, the *dogmatic* one, begins straight away by stating its conclusions. Its premises make demands upon the audience's attention and belief and very little is adduced in support of them. And there is then a danger that a critical hearer may shake his head and say: 'All this sounds most peculiar: where does the fellow get it from?'

In what follows I shall not rely exclusively upon either of the two methods of presentation: I shall make use now of one and now of the other. I am under no delusion about the difficulty of my task. [282]

Psychoanalysis has little prospect of becoming liked or popular. It is not merely that much of what it has to say offends people's feelings. Almost as much difficulty is created by the fact that our science involves a number of hypotheses – it is hard to say whether they should be regarded as postulates[1] or as products of our researches – which are bound to seem very strange to ordinary modes of thought and which fundamentally contradict current views. But there is no help for it. We must begin our brief study with two of these hazardous hypotheses.

THE NATURE OF THE PSYCHICAL

Seele Psychoanalysis is a part of the mental science [*Seelenkunde*]^{T} of psychology. It is also described as 'depth psychology' – we shall later discover why. If someone asks what 'the psychical' really means, it is easy to reply by enumerating its constituents: our perceptions, ideas [*Vorstellungen*]^{T}, memories, feelings and acts of volition – all these form part of what is psychical. But if the questioner goes further and asks whether there is not some common quality possessed by all these processes which makes it possible to get nearer to the *nature*, or, as people sometimes say, the *essence* of the psychical, then it is harder to give an answer.

If an analogous question had been put to a physicist (as to the nature of electricity, for instance), his reply, until quite recently, would have been: 'For the purpose of explaining certain phenomena, we assume the existence of electrical forces [*Kräfte*]^{T} which are present in things and which emanate from them. We study these phenomena, discover the laws that govern them and even put them to practical use. This satisfies us provisionally. We do not know the *nature* of electricity. Perhaps we may discover it later, as our work goes on. It must be admitted that what we are ignorant of is precisely the most important and interesting part of the whole business, but for the moment that does not worry us. It is simply how things happen in the natural sciences.'

Psychology, too, is a natural science. What else can it be? But its case is different. Not everyone is bold enough to make judgements about physical matters; but everyone – the philosopher and the man in the
[283] street alike – has his opinion on psychological questions and behaves as if he were at least an *amateur* psychologist. And now comes the remarkable thing. Everyone – or almost everyone – was agreed that what is psychical really *has* a common quality in which its essence is expressed: namely the quality of *being conscious* – unique, indescribable, but

1 [In the only German edition in which this passage appears, this word, '*Voraussetzungen*', is inexplicably misprinted '*Moralbesetzungen*' ('moral cathexes').]

needing no description. All that is conscious, they said, is psychical, and conversely all that is psychical is conscious: that is self-evident and to contradict it is nonsense. It cannot be said that this decision threw much light upon the nature of the psychical, for consciousness is one of the fundamental facts of our life and our researches come up against it like a blank wall and can find no path beyond it. Moreover, the equation of what is mental with what is conscious had the unwelcome result of divorcing psychical processes from the general context of events in the universe and of setting them in complete contrast to all others. But this would not do, since the fact could not long be overlooked that psychical phenomena are to a high degree dependent upon somatic influences and on their side have the most powerful effects upon somatic processes. If ever human thought found itself in an impasse it was here. To find a way out, the philosophers at least were obliged to assume that there were organic processes parallel to the conscious psychical ones, related to them in a manner that was hard to explain, which acted as intermediaries in the reciprocal relations between 'body and mind', and which served to reinsert the psychical into the texture of life. But this solution remained unsatisfactory.

Psychoanalysis escaped such difficulties as these by energetically denying the equation between what is psychical and what is conscious. No; being conscious cannot be the essence of what is psychical. It is only a *quality* of what is psychical, and an inconstant quality at that – one that is far oftener absent than present. The psychical, whatever its nature may be, is in itself unconscious and probably similar in kind to all the other natural processes of which we have obtained knowledge.

Psychoanalysis bases this assertion on a number of facts, of which I shall now proceed to give a selection.

We know what is meant by ideas [*Einfälle*][T] 'occurring' to one – thoughts that suddenly come into consciousness without one's being aware of the steps that led up to them, though they, too, must have been psychical acts. It can even happen that one arrives in this way at the solution to some difficult intellectual problem which has previously for [284]
a time baffled one's efforts. All the complicated processes of selection, rejection and decision which occupied the interval were withdrawn from consciousness. We shall not be putting forward any new theory in saying that they were unconscious and perhaps, too, remained so.

In the second place, I shall pick a single instance to represent an immensely large class of phenomena.[1] The president of a public body

1 Cf. *The Psychopathology of Everyday Life* [(1901*b*), Chapter V; *RSE*, **6**, 51–2].

(the lower house of the Austrian parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting *closed*.' It was a slip of the tongue [*Versprechen*] – for there can be no doubt that what the president intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out [*Fehlgreifen*] an intention such as may easily happen for various reasons: it had no meaning – and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the house had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the president to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing than opening it!' When he began to speak he was probably not aware of this wish – it was not conscious to him – but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between[1] two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen [*Verschreiben*], every case of misreading [*Verlesen*] or mishearing [*Verhören*], and every faulty action [*Vergreifen*]? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act – a thought, a wish or an intention – which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts
[285] which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake [*Fehlleistung*][T] of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him – for a time, at all events.

In the third place, finally, it is possible in the case of persons in a state of hypnosis to prove experimentally that there are such things as

1 [In the *GW* edition the word '*Entscheidung*' (here rendered 'decide between') is misprinted as '*Erklärung*' ('explain').]

unconscious psychical acts and that consciousness is not an indispensable condition of [psychical] activity. Anyone who has witnessed such an experiment will receive an unforgettable impression and a conviction that can never be shaken. Here is more or less what happens. The doctor enters the hospital ward, puts his umbrella in the corner, hypnotizes one of the patients and says to him: 'I'm going out now. When I come in again, you will come to meet me with my umbrella open and hold it over my head.' The doctor and his assistants then leave the ward. As soon as they come back, the patient, who is no longer under hypnosis, carries out exactly the instructions that were given him while he was hypnotized. The doctor questions him: 'What's this you're doing? What's the meaning of all this?' The patient is clearly embarrassed. He makes some lame remark such as 'I only thought, doctor, as it's raining outside you'd open your umbrella in the room before you went out.' The explanation is obviously quite inadequate and made up on the spur of the moment to offer some sort of motive [*motivieren*] for his senseless behaviour. It is clear to us spectators that he is in ignorance of his real motive. We, however, know what it is, for we were present when the suggestion was made to him which he is now carrying out, while he himself knows nothing of the fact that it is at work in him.[1]

The question of the relation of the conscious to the psychical may now be regarded as settled: consciousness is only a *quality* or attribute [286] of what is psychical, and moreover an inconstant one. But there is one further objection with which we have to deal. We are told that, in spite of the facts that have been mentioned, there is no necessity to abandon the identity between what is conscious and what is psychical: the so-called unconscious psychical processes are the organic processes which have long been recognized as running parallel to the mental ones. This, of course, would reduce our problem to an apparently indifferent matter of definition. Our reply is that it would be unjustifiable and inexpedient to make a breach in the unity of mental life for the sake of propping up a definition, since it is clear in any case that consciousness can offer us only an incomplete and broken chain of phenomena. And it can scarcely be a matter of chance that it was not until the change had been made in the definition of the psychical that it became possible to construct a comprehensive and coherent theory of mental life.

1 I am describing experiments made by Bernheim at Nancy in 1889 which I myself witnessed. In these days there is no need for me to discuss any doubts as to the genuineness of hypnotic phenomena of this kind. [Cf. Freud's fuller account of his visit to Nancy in Chapter I of his *Autobiographical Study* (1925*d*), *RSE*, **20**, 14–15.]

Nor need it be supposed that this alternative view [*Auffassung*]^{T} of the psychical is an innovation due to psychoanalysis. A German philosopher, Theodor Lipps,[1] asserted with the greatest explicitness that the psychical is in itself unconscious and that the unconscious is the truly psychical. The concept of the unconscious has long been knocking at the gates of psychology and asking to be let in. Philosophy and literature have often toyed with it, but science could find no use for it. Psychoanalysis has seized upon the concept, has taken it seriously and has given it a fresh content. By its researches it has led to a knowledge of characteristics of the unconscious psychical which have hitherto been unsuspected, and it has discovered some of the laws which govern it. But none of this implies that the quality of being conscious has lost its importance for us. It remains the one light which illuminates our path and leads us through the darkness of mental life. In consequence of the special character of our discoveries, our scientific work in psychology will consist in translating [*übersetzen*]^{T} unconscious processes into conscious ones, and thus filling in the gaps in conscious perception.

Übersetzung

———————[2]

1 [1851–1914. Professor of Philosophy at Munich. Some notes on Freud's relation to his writings can be found in the Editors' Preface to his book on *Jokes* (1905*c*), *RSE*, **8**, 4.]

2 [The manuscript ends, as here, in a centred horizontal line. However, the next (blank) manuscript page is numbered, suggesting that, although Freud had not finished the envisaged work, he 'broke off intentionally and definitely – literally drawing the final stroke beneath his monumental lifework' (Grubrich-Simitis, 1993, 288; trans., 228).]

Shorter Writings

(1937–39)

LOU ANDREAS-SALOMÉ[1]

(1937)

On February 5 of this year Frau Lou Andreas-Salomé died peacefully in her little house at Göttingen, almost 76 years of age. For the last 25 years of her life this remarkable woman was attached to psychoanalysis, to which she contributed valuable writings and which she practised as well. I am not saying too much if I acknowledge that we all felt it as an honour when she joined the ranks of our collaborators and comrades in arms, and at the same time as a fresh guarantee of the truth of the theories of analysis. [297]

It was known that as a girl she had kept up an intense friendship with Friedrich Nietzsche, founded upon her deep understanding of the philosopher's bold ideas. This relationship came to an abrupt end when she refused the proposal of marriage which he made her. It was well known, too, that many years later she had acted alike as Muse and protecting mother to Rainer Maria Rilke, the great poet, who was a little helpless in facing life. But beyond this her personality remained obscure. Her modesty and discretion were more than ordinary. She never spoke of her own poetical and literary works. She clearly knew where the true values in life are to be looked for. Those who were closer to her had the strongest impression of the genuineness and harmony of her nature and could discover with astonishment that all feminine frailties, and perhaps most human frailties, were foreign to her or had been conquered by her in the course of her life.

It was in Vienna that long ago the most moving episode of her feminine fortunes had been played out. In 1912 she returned to Vienna in order to be initiated into psychoanalysis. My daughter, who was her close friend, once heard her regret that she had not known [298]

1 [*Int. Z. Psychoan.*, **23** (1) (1937), 5; *GW*, **16** (1950), 270. The present translation, apparently the first into English (by James Strachey) is a reprint of the *SE* version (**23**, 297–8). Lou Andreas-Salomé was born in St Petersburg in 1861. Her husband (Friedrich Carl Andreas, 1846–1930) was Professor of Oriental Languages at Göttingen. He married Lou von Salomé in 1887. A number of Freud's letters to her are included in the volume of his correspondence edited by Ernst Freud (1960*a*). See also Ernst Pfeiffer's very full edition of both sides of the correspondence (Freud, 1966*a*).]

psychoanalysis in her youth. But, after all, in those days there was no such thing.

SIGM. FREUD
February, 1937

LETTER TO ISRAEL COHEN[1]

(1954 [1938])

Dear Sir,

To my thanks for your welcome to England, I add the request that I no longer be treated as a 'Leader in Israel'.[2] I would like to be regarded as nothing more than a modest scientist, and to be prominent in no other manner. Although a good Jew who has never repudiated Judaism, I cannot overlook the fact that my absolutely negative attitude to all religion, including the Jewish one, separates me from most of our kin, and renders me unsuitable for the role that you would assign to me.

Respectfully yours
Freud

14.6.1938

1 [This letter appeared in an English translation in the *Jewish Observer and Middle East Review*, **3** (23), June 4, 1954, p. 10. (It is reprinted here, with slight modification by Mark Solms.) The original translation was published with the heading 'A Letter from Freud', in the column 'Hamazkir writes' and was introduced by the following note: 'The publication of a volume of letters from Sigmund Freud to Wilhelm Fliess [viz. Freud (1950*a*)], covering the period from 1887 to 1902, reminds me of a letter that the founder of psychoanalysis wrote to me shortly before the outbreak of the last war, when he arrived in England as a refugee. There was an appeal campaign for the Keren Hayesod at the time, and it occurred to me that a message from this international celebrity would serve as an inspiring incentive.' Cohen, who was sometime General Secretary of the World Zionist Organization (hence the pseudonym 'Hamazkir', which means 'secretary' in Hebrew), therefore sent Freud the following letter, inviting him to undersign it in support of the appeal: 'I have learnt with much interest of the public-spirited effort now being made by the Jews of the Argentine to raise a large fund in aid of the Jewish refugees from Germany and also on behalf of the Jewish resettlement in Palestine. This work of humanity has my warmest sympathy and best wishes, and I earnestly trust all Jews in the Argentine will do their utmost to contribute towards its success.' The German text of Freud's reply was first published in 1987 in *GW*, **Nachtr.**, 776, having been tracked down through the most generous help of Jon Kimche, sometime editor of the *Jewish Observer*, and Dr S. Levenberg, of the Jewish Agency for Israel, London, as well as by the kindness of Dr M. Heymann, Director of the Central Zionist Archives, Jerusalem.]

2 [In English in the original.]

FINDINGS, IDEAS, PROBLEMS[1]

(1941 [1938])

[299] London, June

June 16. It is interesting that in connection with early experiences, as contrasted with later experiences, all the various reactions to them survive, of course including contradictory ones. Instead of a decision, which would have been the outcome later. Explanation: weakness of the power of synthesis, retention of the characteristic of the primary processes. Example: Dorothy in the first flush of love for James the gardener.[2]

June 24. The only dependence on graphology: in 1909 in New York, aged 53, I had sudden-onset prostate enlargement with constant urge to urinate. At the same time, something quite new for me, a writer's cramp, which recovered after several weeks (or months?). Currently, with renewed and intensified attack of the same condition, I notice conspicuous deterioration and impediment of my handwriting. The old urinary symbolism of writing continues.

July 12. As a substitute for penis envy, identification with the clitoris: neatest expression of inferiority, source of all inhibitions. At the same time (in Case X) disavowal of the discovery that other women too are without a penis.

'Having' and 'being' in children. Children like expressing an object

1 [These short disconnected paragraphs were printed at the end of the volume of posthumous works published in 1941 (*GW*, **17**, 151–2) under the heading 'Ergebnisse, Ideen, Probleme: London, Juni 1938'. This heading is Freud's, except for the date of the year. These notes occupy two sides of a single sheet of paper. The translation, by James Strachey, was first published in *SE*, **23**, 299–300. The notes dated June 24 and September 22 were, however, omitted from both the *GW* and the *SE*. These were first reinstated in Ilse Grubrich-Simitis's *Zurück zu Freuds Texten* (1993, 125–6). An English translation by Philip Slotkin of these two notes appeared in the English edition (1996, 92–3). The present translation is by Mark Solms.]

2 [This sentence was omitted from both the *GW* and *SE* editions, no doubt deliberately, for reasons of discretion.]

relation by an identification: 'I am the object.' 'Having' is the later of the two; after loss of the object it relapses into 'being'. Example: the breast. 'The breast is a part of me, I am the breast.' Only later: 'I have it' – that is, 'I am not it' . . .

July 12. With neurotics it is as though we were in a prehistoric landscape – for instance, in the Jurassic. The great saurians are still running about; the horsetails grow as high as palms (?).

July 20. The hypothesis of there being memory traces [*Erspuren*[1]] in the id alters, so to say, our views about it.

July 20. The individual perishes from his internal conflicts, the species perishes in its struggle with the external world to which it is no longer adapted. – This deserves to be included in *Moses.*

August 3. A sense of guilt also originates from unsatisfied love. Like hate. [300]
In fact we have been obliged to derive every conceivable thing from that material: like economically self-sufficient States with their '*Ersatz* [substitute] products'.

August 3. The ultimate ground of all intellectual inhibitions and all inhibitions of work seems to be the inhibition of masturbation in childhood. But perhaps it goes deeper; perhaps it is not its inhibition by external influences but its unsatisfying nature in itself. There is always something lacking for complete discharge and satisfaction – en attendant toujours quelquechose qui ne venait point[2] – and this missing part, the reaction of orgasm, manifests itself in equivalents in other spheres, in *absences*, outbreaks of laughing, weeping ([Case] Xy), and perhaps other ways. – Once again infantile sexuality has fixed a model in this.

August 22. Space may be the projection of the extension of the psychical apparatus. No other derivation is probable. Instead of Kant's *a priori* determinants of our psychical apparatus. Psyche is extended; knows nothing about it.

1 [Grubrich-Simitis (1993, 125 *n.* 2; trans., 92 *n.* 2) points out that this word (Freud's usual abbreviation for '*Erinnerungsspuren*') was misread by the editors of the *GW* as '*Erbspuren*' ('inherited vestiges'). Strachey inadvertently perpetuated the error in the *SE*.]

2 ['Always waiting for something which never came.']

August 22. Mysticism is the obscure self-perception of the realm outside the ego, of the id.

September 22. For origin of Eros: possibility that when life began there was simultaneous disintegration into male and female substances, which, as Plato supposes,[1] have ever since sought to unite. Although not everything fits with this. Origin of Eros and death [drive] would therefore be the same. But where does the simultaneity of the two events come from?

1 [Cf. Freud's similar remarks in the *Three Essays* (1905*d*), *RSE*, **7**, 122, and *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 55.]

ANTI-SEMITISM IN ENGLAND[1]

(1938)

20 Maresfield Gardens [301]
London, N.W.3
16.11.1938

To the Editor of *Time and Tide*

I came to Vienna as a child of 4 years from a small town in Moravia. After 78 years of assiduous work I had to leave my home, saw the Scientific Society I had founded, dissolved, our institutions destroyed, our Printing Press ('Verlag') taken over by the invaders, the books I had published confiscated or reduced to pulp, my children expelled from their professions. Don't you think you ought to reserve the columns of your special number for the utterances of non-Jewish people, less personally involved than myself?

In this connection my mind gets hold of an old French saying:

Le bruit est pour le fat.
La plainte est pour le sot.
L'honnête homme trompé
S'en va et ne dit mot.[2]

I feel deeply affected by the passage in your letter acknowledging 'a certain growth of anti-semitism even in this country'. Ought this present persecution not rather give rise to a wave of sympathy in this country?

Respectfully yours
Sigm. Freud

1 [This letter was written by Freud in English. It was written, as will be gathered from its content, in response to a request from the editor of *Time and Tide* (Lady Rhondda) for a contribution to a special number on anti-Semitism. The letter was published in that paper on November 26, 1938 (p. 1649), under the heading 'A Letter from Freud'. It was included in the collection of Freud's letters made by Ernst Freud (Freud, 1960*a*), and was reprinted in *GW*, **Nachtr.**, 782–3, and *SE*, **23**, 301.]

2 ['A fuss becomes the Fop
A Fool's complaints are heard;
A Gentleman betrayed
Departs without a word.'
From the eighteenth-century play *La Coquette Corrigée* by Jean Sauvé de la Noue (1701–61) – Act I, Scene 3.]

FOREWORD TO HOBMAN'S *DAVID EDER*[1]

(1945 [1939])

M. D. Eder was one of those men distinguished by a rare combination of absolute love of truth and undaunted courage, together with toleration and a great capacity for love. I believe that it was these qualities which aroused his interest in psychoanalysis in its early days, so that he was the first, and for a time the only doctor to practise the new therapy in England. When I first came to know him, I was proud to count him among my pupils. I was also aware that he was engaged in constructive activity in the Zionist movement, but I had not then a full insight into the wealth of his personality. He was very reserved about himself, never putting himself forward in any way. It is only through the valuable study which J. B. Hobman here dedicates to his memory that I have come to learn more about Eder, and I hope that now others also will recognize the man in his simplicity, integrity and goodness, and will value him as he deserves.

SIGMUND FREUD

1 [This foreword was written in 1939, apparently in German. The original is lost. The English translation (by an unknown hand) was first published in J. B. Hobman (ed.), *David Eder: Memoirs of a Modern Pioneer*, London, 1945. It is reprinted here for the first time, with very minor modifications. – Montague David Eder (1865–1936) was an early British psychoanalyst and, like the journalist Joseph Burton Hobman, an ardent Zionist.]

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

GENERAL INDEX

Aaron, 16 *n.* 1, 32
Abraham, 26, 42
'*Absences*', 275
Acquired characteristics, inheritance of, 91, 93 *n.* 2, 119–20, 217
Acting out instead of remembering, 81
Active and passive (*see also* Passive sexual attitude), 169
Adler, A. (*see also* Bibliography), 226
Adonai, 25, 38
Adonis, 25
Aeneid (by *Virgil*), 110 *n.* 1
Aeschylus, 103
Affect, 62, 111, 142, 203 *n.* 1, 234
After-education, 158
After-repression, 205
Agamemnon, 103 *n.* 2
Aggressiveness, 68–9, 73–4, 105, 107, 135–6, 139–40, 220
Agrigentum, 221 *n.* 2
Ahmose, 10
Aichhorn, A. (*see also* Bibliography), 224 *n.* 1
Akhenaten, 7, 21–4, 26, 27–8, 30–1, 44–5, 47, 55–6, 58–9, 81, 100–1, 123
Akhetaten, 23–4
Akhnaton (see *Akhenaten*)
Akki, 13
Alexander the Great, 66
Allah, 85
Amarna (*see* Tell el-'Amarna)
Ambivalence
  of relation to father, 75–6, 80, 110, 119, 121, 123, 158
  of transference, 157–9
Amenophis III, 22, 23
Amenophis IV (see also *Akhenaten*), 21–3, 55
Amen-Re', 20
Amentia, *Meynert's*, 182 and *n.* 1
American prosperity and psychoanalysis, 195–6
Amnesia, infantile, 68–9, 139, 168, 172, 234–6
Amphion, 13
Amun, 22–4, 25, 81
Anal erotism (*see* Sadistic-anal phase)
Analogies
  amoeba and pseudopodia, 136
  archaeological excavation, 235–6
  brackets in algebra, 30 and *n.* 1
  bronze statue with feet of clay, 18
  building a house, 236
  censorship of books, 213–14
  civil war, 156
  dams against the pressure of water/flood, 204–5
  dancer balancing on tip-toe, 54
  economically self-sufficient States, 275
  fire-brigade and oil-lamp, 196
  Galton's composite photographs, 12
  governors of conquered country, 151
  immunization from scarlet fever, 210
  jigsaw puzzle, 18
  key-fossil, 38
  'Made in Germany', 179
  mausoleums, 58
  microscope, use of, 178
  NCO reprimanded by superior officer, 152 *n.* 1
  night-watchman, 154
  photographic negative, 114

Analogies (*cont.*)
prehistoric landscape, 275
prick of needle during cell division, 167
'primitive' peoples who have had Christianity thrust upon them, 211
sculptor in stone or clay, 218
sleeping dogs, 208
State within a State, 70
sutures after an operation, 197
walking in unknown country with bad legs, 214
X-ray, 225
Anat-Yahu, 58
Andreas, *F. C.*, 271 *n.* 1
Andreas-Salomé, *L.*, 271–2
Animal (*see also* Totem animal)
ancestry of human beings, 69, 168
gods, 19–20, 76–7, 120
phobias, 76, 77
Animals
compared to human beings, 89, 92, 120, 133, 139 *n.* 1, 146
Egyptian attitude to, 29 *n.* 2
instinct in, 92, 120
of the Evangelists, 78
Anticathexes, 86–7, 149–50, 155, 161, 192
Anti-Semitism (*see* Jews, persecution of)
Antithetical meaning of primal words, 152
Anxiety (*see also* Fear; Phobias), 165, 178–9, 198, 212, 252
as danger signal, 132, 134, 180
Anxiety dreams, 154
Anxiety state, 243
Archaic heritage, 89–93, 120, 150, 170, 171 *n.* 1, 181–2, 186, 217
Astruc, *J.*, 40 *n.* 3
Aten, worship of, 22–30, 35, 39, 47, 55–6, 58–9, 64, 81, 102
Athene, 23, 43 *n.* 1
Atkinson, *J. J.* (*see also* Bibliography), 74, 118
Aton (see *Aten*, worship of)
Atum, 22, 25 and *n.* 2
Auditory perception, 89, 146
Auerbach, *E.* (*see also* Bibliography), 40 *n.* 2, 41 *n.* 2, 58 *n.* 1
Austria invaded by Germany, 4, 53, 94, 277
Auto-erotism (*see* Masturbation)
Avoidances, 70
Azupirani, 13

Baalim, 64, 112
Baby equated with penis, 226
Babylon, 12, 13 *n.* 1, 35, 101
Back to Methuselah (by *G. B. Shaw*), 50 *n.* 2
Beethoven, 99
Behaviourism, 142 *n.* 1
Bernheim, *H.*, 267 *n.* 1
Bes, 19
Bible, the, 7, 9–11, 16 *n.* 1, 26–9, 31–4, 38–40, 42–5, 47, 53, 56–7, 61
Birth
infantile theories of, 140, 211
myths, 12–16
symbols of, 13
trauma of, 195
Bisexuality, 169, 220
Blinding as symbol of castration, 171 *n.* 1
Bonaparte, *Napoleon I*, 11
Bonaparte, *Princess Marie*, 4 *n.* 1, 223 *n.* 1
Bondage, sexual, 172, 227–8
Boy's
relation to father, 13–14, 73–4, 75, 76, 80, 108–9, 113–14, 158, 170–2
relation to mother, 70, 140, 170–2
sexual development, 140, 169–73, 174, 181
Brain, anatomy of, 89, 131
Branson, *J. S. H.*, 173 *n.* 1
Breast (*see* Suckling and breast)
Breasted, *J. H.* (*see also* Bibliography), 7, 10–11, 21 *nn.* 1 & 2, 22 *n.* 2, 23 *nn.* 1, 2 & 4, 24 *nn.* 2 & 4, 47 *n.* 4
British sense of superiority, 102
Brunswick, *R. Mack* (*see also* Bibliography), 197
Budapest, International Psychoanalytical Congress of 1918 at, 209 *n.* 1

Canaan occupied by the Jews, 28–9, 36–7, 44, 46, 49, 56–7, 112

Cambridge Ancient History (*see also* Bibliography), 21 *n.* 2
Cannibalism, 75, 135
Capelle, *W.* (*see also* Bibliography), 221–2
Case
  of '*Dora*', 233 *n.* 2
  of *Herr E.*, 194
  of '*Little Hans*', 84 *n.* 1
  of '*Rat Man*', 231, 233 *n.* 2
  of '*Wolf Man*', 93 *n.* 2, 196–7, 218 *n.* 4, 231, 237 *n.* 1
Case, unnamed
  of analyst analysed, 200
  of a homosexual girl, 231
Casket as symbol, 12, 13
Castration
  complex, 77–8, 84 and *n.* 1, 91, 140, 171–2, 173–5, 181, 183, 226–8, 247, 250–1
  in primal horde, 75, 111
  of *Kronos* by *Zeus*, 251–2
  symbolized by blinding, 171 *n.* 1
  symbolized by circumcision, 84 and *n.* 1, 111, 171 *n.* 1
  threat of, 73, 140, 171–2, 174, 181, 250–1
Cathexis, 89, 148, 151
Catholic Church, 4, 51–3
Chamisso, *A. von*, 11 and *n.* 1
Character
  analysis, 225–6
  traits, 70, 73–4, 113–14, 141, 172, 195
Childhood (*see also* Infantile)
  dependence of, 133, 167, 169, 181, 186
  impressions, 67–9, 71, 114–15, 117, 150, 168–9, 197, 234–8, 241–3
Children (*see also* Parents and children)
  and belief in omnipotence of thoughts, 103
  compared to animals, 120
  compared to 'primitive' man, 75, 76, 103
  emotional impulses of, 121
  neuroses of, 71, 91, 166
  psychoanalysis of, 77
  sexual abuse of, 168
  sexual enlightenment of, 211
  sexual researches of, 140
  sexual theories of, 68, 140, 211
'Chosen people' (*see* Jews as 'chosen people')
Christianity (*see also* Catholic Church; Communion, Christian, equated with totem meal), 80, 84, 211, 257
  development of, from Judaism, 79, 81–3, 122–3
  monotheism in, 78, 81–2, 123
Churchill, *W.*, 258 *n.* 1
Circumcision
  as mark of being 'chosen', 56, 81, 84
  equated with castration, 84 and *n.* 1, 111, 171 *n.* 1
  in Egypt, 26–7, 29 *n.* 2, 33–4, 38, 42–3
  introduced to the Jews by *Moses*, 26–7, 29–30, 56, 57, 110–11
  obligatory in the *Yahweh* religion, 38, 42
  of *Moses* by his Midianite wife, 26, 42
Civilization, 51, 103–4, 120, 122, 167, 171, 181–2, 207, 220–1
Clitoris, 140 and *n.* 2, 274
Cloacal theory of birth, 140
Clytemnestra, 103 *n.* 2
Cohen, *I.* ('*Hamazkir*'), 273
'Collective' unconscious, 120
Cologne, 83
Communion, Christian, equated with totem meal, 77, 80, 119
Complemental series, 68
Component drives, 137–41, 167–8
Compromises
  dreams as, 151, 153–4, 183
  symptoms as, 70, 72
Compulsion to repeat, 69–71
Compulsive character
  of childhood impressions, 117
  of delusions, 78, 118
  of religious phenomena, 66–7, 93, 102–3
  of symptoms, 70
Condensation in dreams, 151–2
Conflicts, drive (*see* Drive conflicts)
Confusional states, 182
Conscience, 106, 185–6
Consciousness
  exclusion from, in repression, 86–7, 144–5

Consciousness (*cont.*)
nature of, 142–6, 177, 264–5, 267–8
psychoanalysis returns repressed material to, 215, 242–3
relation to brain, 131
relation to preconscious, 89, 144–7
relation to unconscious, 87, 92–3, 144–6
relation to the ego, 87–8, 146–7, 149, 161
Constitutional strength of drives, 192, 199, 202–3
Constructions in psychoanalysis, 231, 234–42, 243
Coquette Corrigée, *La* (by *J. S. de la Noue*), 277 *n.* 2

Coudenhove-Kalergi, *R.*, 258
Cows, Egyptian attitude to, 29 *n.* 2
Credo quia absurdum, 78, 107
Crete, 43 *n.* 1, 65
Cryptomnesia, 221
Cs., use of abbreviation, 87 *n.* 1
Culture
readiness for culture, 181
susceptibility to, 181 *n.* 1
use of term, 181 *n.* 1
Cyrus, 13, 14

Danger
anxiety as signal of, 132, 134, 180
avoidance of, 115, 132, 134, 180–1, 212, 214, 249, 251
Darwin, *C.* (*see also* Bibliography), 61–2, 74, 118
David, *King*, 40–1
Day's residues and dreams, 153, 154
Death and Egyptian religion, 20, 24
Death drive, 134–6, 140 and *n.* 1, 162–3, 168, 178–9, 192, 203 *n.* 1, 219–21, 222, 276
Defence mechanisms (*see also* Ego, the, and defence), 70–4, 180–1, 212–17, 225
Deferred action (see *Nachträglichkeit*)
Degeneracy, 138
Delusions
core of truth in, 78, 118 and *n.* 1, 243
of mankind, 118, 244
psychotic, 78, 118, 155, 182, 197, 242–3
Depressive states, 227
Depth psychology, 264
Destructiveness (*see* Death drive)
Diderot, *D.*, 173
Diphasic onset of sexual function, 69, 139, 168
Disavowal, 129, 184, 247, 249
Displacement
in dreams, 151–2, 183, 242
in legends, 41
in neurosis, 243
in ultra-clear memories, 241–2
of drive aim, 134, 141
Disraeli, *B.*, 11
Distortion
as form of resistance, 87, 216
in creative literature, 172–3
in delusions, 78, 118
in dreams, 149, 151, 154, 234
in memories, 242–3
in symptom-formation, 115
in traditions, 26–7, 29–30, 32, 40–2, 64, 113, 117–18, 122–3
'*Dora*', case of (*see* Case of '*Dora*')
Dream content, manifest, 149, 151–3
Dream interpretation, 149–54, 160, 177
Dream thoughts, latent, 149, 151–3
Dreams
anxiety, 154
as compromises, 151, 153–4, 183
characteristics of, 149
childhood impressions as source of, 114, 150
compared to symptoms, 154–5, 183
condensation in, 151–2
day's residues and, 153, 154
displacement in, 151–2, 183, 242
distortion in, 149, 151, 154, 234
drive demands expressed in, 149–51, 153, 204
hallucinatory nature of, 146, 149, 180, 241–2
of convenience, 153
of neurotics, 182
of psychotics, 182
relaxation of resistance in, 145

secondary revision of, 151
sleep and, 149–50, 153–4
symbolism in, 90, 150, 152
waking life and, 149, 150–1, 153–4
wish fulfilment in, 149–50, 153–4
Dream-work, 149, 151–4
Drive
aim, displacement of, 134, 141
conflicts, 136, 193, 201–5, 208–11, 212, 220, 249–51, 275
demands of the id, 88, 105–6, 132, 134, 153, 155–6, 178–80, 218
impulses and dreams, 149–51, 153, 204
Drives (*see also* Component drives; Death drive; Eros; Nutritional drive; Self-preservative drive; Sexual drive)
conservative nature of, 134
renunciation of, 75, 103, 105–9, 110–12, 115, 121–2, 141, 161, 167–8, 180–2, 184–5, 204–5
strength of, and aetiology of neurosis, 71, 87, 163–4, 165–8, 180–1, 192, 199, 201–5, 211, 249
taming of, 199, 203–4
the ego and, 105–6, 115, 149–51, 153–4, 180–1, 182–5, 192, 199, 202–5, 207, 212
theory of, 134–7, 143, 219 *n.* 1, 220–2
use of term, 92 *n.* 1
Dualistic theory of drives, 219 *n.* 1, 220–1, 222, 276
Dynamic view of mental processes, 89, 141, 204, 214, 234, 242

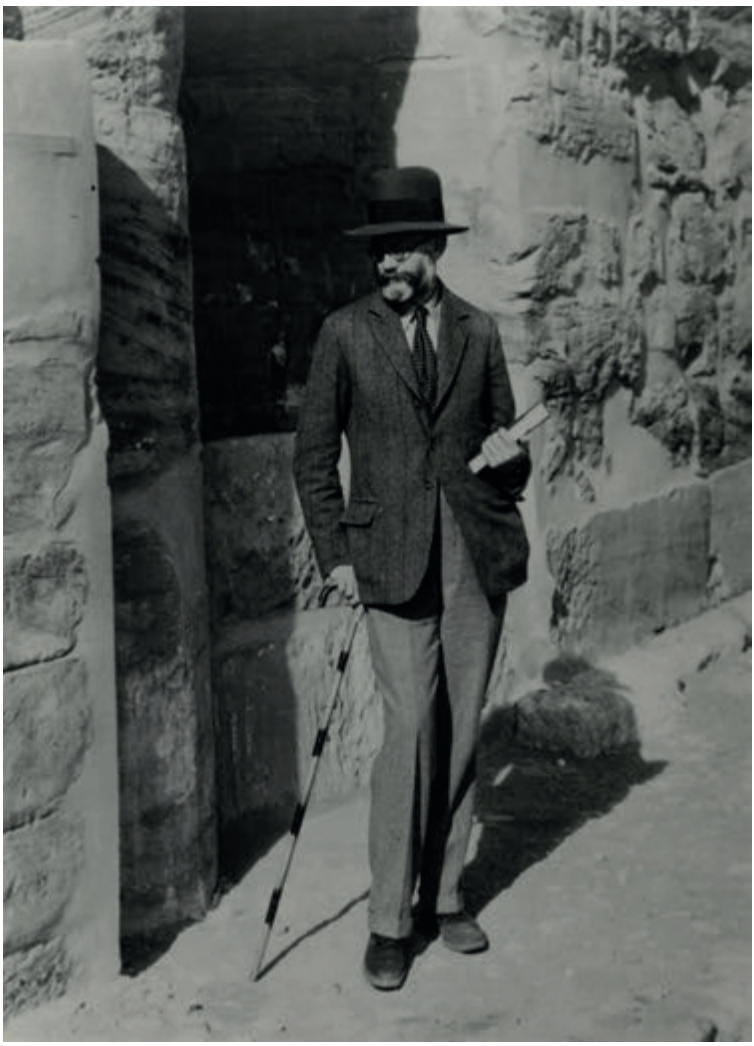
THE REVISED STANDARD EDITION OF
THE COMPLETE PSYCHOLOGICAL WORKS
OF SIGMUND FREUD

VOLUME XXIV



James Strachey in Egypt, 1934/5

James Strachey in Egypt, 1934/5

The photograph was probably taken by Alix Strachey. In a letter to Ernest Jones dated November 7, 1920, Freud wrote: 'Strachey seems to prove a good acquisition. His translations to me seem excellent.' In a letter to Freud dated August 12, 1924, Jones wrote: 'Strachey also, though terribly slow, has improved in his work so much that he now ranks as easily the best translator here or in America, nuch [much] better than either Mrs Riviere or myself.'

INTRODUCTION

As mentioned in the 'Note on the Revised Translation' which appears in Volumes 1–23, this volume of the *Revised Standard Edition* is more different from its *Standard Edition* counterpart than any of the other volumes. For this reason, the policy of underscoring the differences between the *RSE* and *SE* does not apply to this volume, which readers may consider to be entirely different from *SE*, **24**. In broad outline, the changes are as follows:

The title of the volume has been changed from 'Indexes and Bibliographies' to 'Translation Notes, Bibliographies and Indexes'. The 'Preface' by Anna Freud has been dropped. The 'Introduction' by Angela Richards has likewise been dropped and replaced with the present version. The 'Contents of the Standard Edition, Volumes I–XXIII' has been updated to become the 'Contents of the Revised Standard Edition, Volumes I–XXIII', and it has been supplemented by two subsections entitled 'List of New Freud Material in the Revised Edition' and 'List of Relocated Freud Material in the Revised Edition'. The 'Alphabetical List of Freud's Writings . . .' has likewise been updated. A new section entitled 'Notes on the Translation' has been added, the contents and organization of which are outlined in a new 'Editor's Introduction', on p. 41, below. Strachey's 'Notes on Some Technical Terms Whose Translation Calls for Comment', from *SE*, **1**, are included in this section in the form of an Appendix to the current 'Notes'. The enormous contribution made to this section by Professor Riccardo Steiner is acknowledged by the inclusion of his name on the title page of this volume. Substantial assistance by Dr Gyuri Fodor with the 'Annotations to Individual Translations' is also gratefully acknowledged. The 'Index of Editorial Annotations' has not only been updated to include all the new editorial annotations but also revised to include several of Strachey's annotations that were overlooked in the *SE* version of this index. The position of the index has also been moved to the back of the volume. The 'Bibliography and Author Index' section has been substantially updated and retitled 'Bibliographies'. The revised contents and organization of this section are outlined in a new 'Editor's Introduction', on p. 137, below. The 'List of Periodicals and Monograph Series' has been dropped. The 'Index of Cases', 'List of Dreams', 'Index of Symbols', 'List of Analogies' and 'Index of Works of Art and Literature' have – where necessary – been merged with the previous 'General Subject Index', which has also been substantially revised in other ways and is now recast in a section entitled 'Index of Subjects'. This is complemented by an 'Index of Names', which combines and updates the previous 'Index of Personal Names' and 'Author Index Excluding Freud' (as explained in the Editor's Introduction to the new 'Bibliographies' section, on p. 140, below). Most

people have no idea what scholarly indexing of this kind entails. For an amusing account, see *Index, A History of the* by Dennis Duncan (2021). The slog-work that Natasha Jooste did on the individual volume indexes, which formed the basis for the two composite indexes in this volume, is gratefully acknowledged. Lastly, the section entitled 'Addenda and Corrigenda' has been dropped, and its contents worked into the previous twenty-three volumes. This part of the work was performed largely by the late Albert Dickson.

The fact that the name of Mary Tobin – the copy editor of the *RSE* as a whole – does not appear on its title pages is purely conventional. The fact that I acknowledged my debt to her in the 'Preface to the Revised Edition' in *RSE*, **1**, instead, similarly follows convention; but I would like it to be recorded here that the acknowledgement itself was not merely conventional. Our debt to her is huge; and she is surely the best copy editor I have ever had the pleasure of working with.

CONTENTS OF THE REVISED STANDARD EDITION, VOLUMES I–XXIII

CONTENTS OF THE REVISED STANDARD EDITION, VOLUMES I–XXIII

The following list is abbreviated from the Contents pages of the individual volumes. In addition to the titles listed here, each work is provided with an Editorial Note or Introduction, and every volume begins with a NOTE ON THE TRANSLATION and is supplied with a BIBLIOGRAPHY, a LIST OF ABBREVIATIONS and a GENERAL INDEX at the end of the book (with the exception of the double Volumes 4/5 and 15/16).

VOLUME I

General Preface xv

Preface to the Revised Edition xxiii

Report on my Studies in Paris and Berlin (1956 [1886]) 5

Preface to the Translation of Charcot's *Lectures on the Diseases of the Nervous System* (1886) 19

Observation of a Severe Case of Hemianaesthesia in a Hysterical Male (1886) 25

Three Short Reviews (1887)

- Review of Averbeck's *Die akute Neurasthenie* 35
- Review of Weir Mitchell's *Die Behandlung gewisser Formen von Neurasthenie und Hysterie* 36
- Review of Berkhan's 'Deaf-Mutism' (1887) 37

Hysteria (1888) 43

Hystero-Epilepsy 61

Papers on Hypnotism and Suggestion (1888–92)

Review of Obersteiner's *Hypnotism* (1888) 75

Preface to the Translation of Bernheim's *Suggestion* (1888 [1888–89]) 81

- Preface to the Second German Edition 93

Review of August Forel's *Hypnotism* (1889) 99

Hypnosis (1891) 115

Report of a Lecture 'On Hypnosis and Suggestion' (1892) 129

A Case of Successful Treatment by Hypnotism (1892–93) 145

Preface to the Translation of Charcot's *Tuesday Lectures* (1892–94) 161

Extracts from Freud's Footnotes to his Translation of Charcot's *Tuesday Lectures* 165

Sketches for the 'Preliminary Communication' of 1893 (1940–41 [1892])

Letter to Josef Breuer 175

'III' 177

On the Theory of Hysterical Attacks 179

Some Points for a Comparative Study of Organic and Hysterical Motor Paralyses (1893 [1888–93]) 187

Extracts from the Fliess Papers (1950 [1892–99]) 250

(*Including*: Draft A; Draft B: The Aetiology of the Neuroses; Draft D: On the Aetiology and Theory of the Major Neuroses; Draft E: How Anxiety Originates; Draft F: Collection III; Draft G: Melancholia; Draft H: Paranoia; Draft I: Migraine: Established Points; Draft J: Frau P. J.; Draft K: The Neuroses of Defence (A Christmas Fairy Tale); Draft L: Notes I; Draft M: Notes II; Draft N: Notes III.

Also: Letters numbered: 14, 18, 21, 22, 46, 50, 52, 55, 56, 57, 59, 60, 61, 64, 66, 67, 69, 70, 71, 72, 73, 75, 79, 84, 97, 101, 102, 105, 125.)

Project for a Scientific Psychology (1950 [1895]) 319

Editors' Appendix A: Freud's Use of the Concept of Regression 369

Editors' Appendix B: Extract from Freud's Letter 39 to Fliess of January 1, 1896 413

Editors' Appendix C: The Nature of *Q* 417

VOLUME II

STUDIES ON HYSTERIA (1895 [1893–95]) (Freud & Breuer) 3

Four Documents in the Case of 'Nina R.' (1978 [1891–94]) 277

Two Contemporary Reports of a Three-Part Lecture 'On Hysteria' (1895) 291

Editors' Appendix A: The Chronology of the Case of Frau Emmy von N. 309

Editors' Appendix B: List of Writings by Freud dealing principally with Conversion Hysteria 311

VOLUME III

Preface to Freud's *Collection of Shorter Writings on the Theory of the Neuroses from the Years 1893–1906* (1906) 5

Charcot (1893) 11

On the Psychical Mechanism of Hysterical Phenomena: A Lecture (1893) 27

The Neuropsychoses of Defence (1894) 43

Editors' Appendix: The Emergence of Freud's Fundamental Hypotheses 57

Obsessions and Phobias: Their Psychical Mechanism and their Aetiology (1895 [1894]) 67

Editors' Appendix: Freud's Views on Phobias 75

On the Grounds for Detaching a Particular Syndrome from Neurasthenia under the Description 'Anxiety Neurosis' (1895 [1894]) 81

Editors' Appendix: The Term '*Angst*' and its English Translation 104

A Reply to Criticisms of my Paper on Anxiety Neurosis (1895) 109

Mechanism of Obsessional Ideas and Phobias (1895) 129

Review of Moebius's *Migraine* (1895) 137

Review of Hegar's *The Sexual Drive* (1895) 147

Heredity and the Aetiology of the Neuroses (1896) 153

Further Remarks on the Neuropsychoses of Defence (1896) 173

The Aetiology of Hysteria (1896) 199

ABSTRACTS OF THE SCIENTIFIC WRITINGS OF DR SIGM. FREUD 1877–97 (1897) 231

Sexuality in the Aetiology of the Neuroses (1898) 259

The Psychical Mechanism of Forgetfulness (1898) 283

Screen Memories (1899) 295

Autobiographical Note (1901 [1899]) 317

VOLUME IV

THE INTERPRETATION OF DREAMS (1900)

(Chapters I–VI (C)) 1

VOLUME V

THE INTERPRETATION OF DREAMS (1900)
(Chapters VI (D)–VII) 303
Running Heads from the First Edition 556
A Premonitory Dream Fulfilled 562
Characteristics of My Own Dreams (Typical Dreams) 565
Editors' Appendix: List of Writings by Freud dealing predominantly or largely with Dreams 568
ON DREAMS (1901) 573
Editors' Index: Dreams 641

VOLUME VI

THE PSYCHOPATHOLOGY OF EVERYDAY LIFE (1901) 1
Editors' Index: Parapraxes 251

VOLUME VII

Fragment of an Analysis of a Case of Hysteria (1905 [1901]) 7
THREE ESSAYS ON THE THEORY OF SEXUALITY (1905) 115
Editors' Appendix: List of Writings by Freud dealing predominantly or largely with Sexuality 216
Freud's Psychoanalytic Procedure (1904 [1903]) 223
Review of Löwenfeld's *Psychical Compulsive Phenomena* (1904) 233
Psychical (or Mental) Treatment (1905 [c. 1894/95]) 241
Addendum (1918/19) 259
On Psychotherapy (1905 [1904]) 267
My Views on the Part Played by Sexuality in the Aetiology of the Neuroses (1906 [1905]) 281
Addendum (1922) 289
Psychopathic Characters on the Stage (1942 [1905–06]) 295
Statement on Marriage Law Reform (1905) 305
Statement on Homosexuality (1905) 313

Contributions to the *Neue Freie Presse* (1903–05)
Review of Biedenkapp's *Im Kampfe gegen Hirnbacillen* 315
Review of Bigelow's *The Mystery of Sleep* 316
Review of Baumgarten's *Neurasthenia* 316
Note on '*Magnetische Menschen*' 317
Obituary of Professor S. Hammerschlag 317
Review of Wichmann's *Rules of Life for Neurasthenics* 318

VOLUME VIII

JOKES AND THEIR RELATION TO THE UNCONSCIOUS (1905) 9
Editors' Appendix: Franz Brentano's Riddles 206
Editors' Index: Jokes 215

VOLUME IX

DELUSIONS AND DREAMS IN JENSEN'S *GRADIVA* (1907 [1906]) 5
Postscript to the Second Edition (1912) 74
Psychoanalysis and the Establishment of the Facts in Legal Proceedings (1906) 83
Obsessive Actions and Religious Practices (1907) 97
The Sexual Enlightenment of Children (1907) 111
Creative Writers and Daydreaming (1908 [1907]) 123
Hysterical Phantasies and their Relation to Bisexuality (1908) 137
Character and Anal Erotism (1908) 149
'Civilized' Sexual Morality and Modern Nervous Illness (1908) 159
On the Sexual Theories of Children (1908) 183
Some General Remarks on Hysterical Attacks (1909 [1908]) 201
Family Romances (1909 [1908]) 211
Shorter Writings (1906–09)
Contribution to a Questionnaire on Reading 217
Prospectus for *Schriften zur angewandten Seelenkunde* 219
Preface to Wilhelm Stekel's *Nervous Anxiety States and their Treatment* 221

Preface to Sándor Ferenczi's *Psychoanalysis: Essays in the Field of Psychoanalysis* 223

VOLUME X

Analysis of a Phobia in a Five-Year-Old Boy (1909) 5

Notes upon a Case of Obsessional Neurosis (1909) 119

Original Record of the Case 195

Appendix: Some Writings by Freud dealing with Anxiety and Phobias in Children and with Obsessional Neurosis 241

VOLUME XI

FIVE LECTURES ON PSYCHOANALYSIS (1910 [1909]) 11

Editors' Appendix: List of Expository Works by Freud 53

LEONARDO DA VINCI AND A MEMORY OF HIS CHILDHOOD (1910) 61

The Future Prospects of Psychoanalytic Therapy (1910) 129

NOTES ON THE TRANSLATION

NOTES ON THE TRANSLATION

EDITOR'S INTRODUCTION

These introductory remarks should be read in conjunction with the 'Preface to the Revised Edition' (*RSE*, **1**, xxiii–xxxii). Some of the points made there are amplified here, and *vice versa*.

Perhaps the most important question I faced as Editor of the *Revised Standard Edition of the Complete Psychological Works of Sigmund Freud* was whether a new translation was called for. Since I am also responsible for the forthcoming *Complete Neuroscientific Works of Sigmund Freud*, I simultaneously had to decide whether we would continue to use James Strachey's standard (but now controversial) translations of technical terms in the *NSW*. These two questions were obviously linked, since the purpose of the companion editions was to provide a standardized translation of Freud's complete scientific writings, which will enable English-speaking readers to trace the terminological and conceptual continuities between his neuroscientific and psychological thinking. As these continuities were revealed to me while I translated the neuroscientific works (continuities that would certainly have existed in Freud's mind, but of which we – his English-speaking readers – were previously unaware), fresh light was cast on these questions.

Before providing an example of the continuities I have in mind, it is necessary to remind readers why Strachey's translations became controversial in the first place. When studying the critical literature that has accumulated around them, it becomes clear that the basic criticism of his translations is quite simple: the essential claim is that Strachey *falsely scientized Freud*. The criticism is that the ordinary, descriptive language used by Freud was transformed by Strachey into technical jargon that relies far too heavily on neologisms derived from ancient Greek and Latin. The best-known criticisms of Strachey's translations are almost all of this type.

Here are some examples. Where Freud wrote *Anlehnung* – which means, when literally translated, 'leaning on' or 'propping' or (according to some) 'attachment' or 'dependence' – Strachey put 'anaclisis', a previously unknown word derived from ancient Greek. Where Freud wrote *Besetzung*, which literally means 'occupation' or 'engagement' or 'investment' (or the like), Strachey put 'cathexis', another previously unknown word derived from ancient Greek. Where Freud wrote *Einfühlung*, which literally means 'feeling into', Strachey put 'empathy', yet another neologism derived from ancient Greek. Where Freud wrote *Ich*, *Es* and *Überich*, which literally mean 'I', 'it' and 'over-I', Strachey used the Latinate terms 'ego', 'id' and 'super-ego'. Where Freud wrote *Regung*, which literally means 'stirring', Strachey put the more scientific-sounding 'impulse'. Where Freud wrote *Schaulust*, which literally means something like 'pleasure in looking' or 'desire to look', Strachey put 'scopophilia',

which sounds like a disease. Where Freud wrote *Seele*, which could easily be translated as 'soul', Strachey put 'mind'. Where Freud wrote *Trieb*, which means 'drive', or something like 'urge', Strachey put 'instinct' – which has precise (but different) biological connotations. Where Freud wrote *Ungeschehenmachen*, a made-up word that literally means 'making unhappened', Strachey used the abstraction 'undoing'. Where Freud wrote *Verschiebung*, which literally means 'shifting', Strachey put 'displacement' – again, a technical elevation of the German word. These are just a few examples; one could easily list many more 'false scientizations' of Freud.

The argument which follows in the literature from these criticisms of Strachey's translations is that they created the impression that Freud was writing about objective mechanisms, the workings of a mental instrument, rather than the experiential phenomena that actually constitute subjective life. This in turn (it is argued) distorted the direction that the discipline of psychoanalysis took in the Anglo-Saxon world after Freud's death, and contributed to the scientistic excesses of ego psychology, the full consequences of which are being felt today with the supposed collapse of psychoanalysis in America. Bruno Bettelheim, in his well-known book *Freud and Man's Soul* (1983), was the most vociferous exponent of this view; but, as stated, the bulk of the criticisms of Strachey's translations boil down to the same argument.

There are many problems with the claim that Strachey falsely scientized Freud. The first and most obvious problem is the fact that Freud himself repeatedly asserted that psychoanalysis was a natural science. In his short essay 'Some Elementary Lessons in Psycho-Analysis' (1940*b* [1938]) – the last word he wrote on the subject – Freud not only repeated his view that psychology was a natural science, he went so far as to ask rhetorically: 'What else can it be?' (*SE*, **23**, 282/*RSE*, **23**, 264). So, the question arises, if Freud thought that psychoanalysis was without question a natural science, then how could Strachey have falsely scientized his psychoanalytic terminology?

This leads to an example of the hidden continuities between Freud's neuroscientific and psychoanalytic works. Let us consider the first word on the list of 'false scientizations' cited above: *Anlehnung*. There can be no doubt that this German term (although a neologism of Freud's) is an ordinary descriptive word, which means, literally translated, something like 'leaning on'. Thus, when Freud describes a particular type of relation as being of an *angelehnte* type, the German-speaking reader knows immediately, at least roughly, what he means by it. And yet Strachey translated *Anlehnung* as 'anaclisis' – a completely unknown word with very ancient Greek roots. When English-speaking readers learn that someone has made an 'anaclitic' object choice, therefore, they have no idea what it means unless they are versed in Strachey's arcane terminology. On the face of it, there could be no better example of what Jean Laplanche (1992, 52) called the 'false scientization of Freud'. We can even understand why Laplanche (1991, 403) went so far as to describe 'anaclisis' as 'a barbaric and lifeless term'. But if we venture a little more deeply into the matter, we discover that things are not as simple as they appear to be.

In an article that Freud wrote in 1878 (while he was still an anatomist) on the spinal ganglia and cord of a lowly fish called Petromyzon, he named a previously unknown type of nerve fibre, which attaches itself to the branches of a spinal nerve root but has no independent origin in the root, as *angelehnte Fasern* (Freud, 1878*a*). This was one of Freud's first scientific discoveries, and he was proud of it. So here, in an indisputably scientific context, Freud used the very same ordinary, descriptive term to name

a particular type of nerve fibre that he would later use to name a particular type of object choice. Now, according to the suggestions of Strachey's critics, the English translator should call Freud's new type of nerve fibre a 'leaning-on' or 'propping' type of nerve fibre; and, on the reasoning of these same critics, if I were to translate it as an 'anaclitic' type of nerve fibre, I would be falsely scientizing Freud. Clearly, there is something wrong here, because, in fact, quite the opposite is more likely to be true. If, in Freud's *Complete Neuroscientific Works*, I translated *angelehnte Fasern* as 'leaning-on fibres', this would justifiably be rejected as a false colloquialization of Freud. And if I chose different terms for Freud's anatomical and psychological concepts (if I chose 'anaclitic' for the anatomical concept and 'leaning on' for the psychological one), I would still be in trouble; for then I would have obscured from the English-speaking reader an interesting and potentially important link between the two concepts.

Now we can address the question: why did Freud use ordinary descriptive terms in his psychological writings? Strachey's critics have argued that, if Freud had intended the language of psychoanalysis to be a language of natural science, he would have used technical terms of the sort that Strachey used. But he did not; he used words like *Anlehnung* and *Besetzung* and *Einfühlung*. As we have just seen, an answer to the question begins to emerge when we realize that Freud used everyday, descriptive language in his earlier, neuroanatomical writings, too, which indisputably belonged to the realm of natural science. This is due to the fact (which Strachey's critics do not seem to know) that different conventions apply in German and English scientific writing.

These different conventions can be illustrated by some further examples from the field of anatomy, which is the natural science that Freud knew best when he was devising his psychoanalytic terminology. In the anatomy of the brain there is a large beam of fibres which connects the two cerebral hemispheres together; at the front of this structure there is a bend which (in sagittal section) looks very much like the human knee. In German neuroanatomy this beam of fibres is called the *Balken*, and the knee-like bend at its front end is described as *das Knie des Balkens*. Literally translated, this means that the beam of fibres is simply called 'the beam', and the knee-like bend at the front of it is called 'the knee of the beam'. But in English neuroanatomy we describe these same structures by neologisms derived from classical antiquity; we call the beam the 'corpus callosum' and we call the knee-like bend at its front end 'the genu of the corpus callosum'. When German medical students first learn about *das Knie des Balkens* they immediately have an image of it, derived from everyday experience, which gives them a reasonably good idea of what sort of thing they are reading about; but when English medical students first learn about 'the genu of the corpus callosum' they have no idea what it means, unless they are versed in the arcane language of neuroanatomy. The advantage of the German approach is obvious, but it must be remembered that the English approach has advantages too: the intention was to establish a scientific lingua franca. As Jones (1924, 2) put it: 'Germany of all the civilized countries is the only one that eschews the international vocabulary, a fact that has called for much spleen among foreign readers of that language.'

This puts a different light on the controversy surrounding Freud's *Anlehnung* in relation to Strachey's 'anaclisis'. This problem, which Strachey's critics imply is a problem of his own invention, is, in fact, a problem – or rather a convention – of all

German scientific writing in relation to English scientific writing. In English, one does not (as a rule) give scientific concepts everyday, descriptive names; however, in German, one does, even when describing the most technical of things.

Here are some more examples, to demonstrate that *das Knie des Balkens* is by no means an isolated instance. Something called the *Brücke* in German neuroanatomy, which, literally translated, means the 'bridge', is called the 'pons' in English neuroanatomy. Something called the *Vierhügel* in German neuroanatomy, which literally means the 'four hills', is called the 'corpora quadrigemina' in English; something called the *Kleinhirn* in German, which literally means the 'little brain', is called the 'cerebellum' in English; and something called the *Bogenfasern* in German, which literally means the 'arched fibres', is called the 'arcuate fasciculus' in English. In all these instances (chosen more or less at random) the German scientific term is an everyday, descriptive one, while the English equivalent is a neologism derived from the ancients.

For readers who are unfamiliar with anatomy, perhaps this example from chemistry will be more telling. Something called *Sauerstoff* in German chemistry, which, literally translated, means 'sour stuff', is called 'oxygen' in English chemistry. And something called *Wasserstoff* in German, which literally means 'water stuff', is called 'hydrogen' in English. I will discuss shortly why we do not even notice the classical origins of these terms; it is because they have become *familiar* to us (just as 'ego', 'id' and 'superego' have).

Now, perhaps readers can understand why, when Strachey asked Freud in response to a letter from Ernest Jones (dated April 17, 1921) whether an explanatory footnote to C. M. Baines's English translation of *Anlehnung* should be supplemented, Freud advised against it (letter from Strachey to Jones, May 18, 1922).

This reminds us of another fact relevant to the problem we are discussing, namely the fact that Freud himself was alive and well when his works were first translated into English, and therefore that he either tacitly or explicitly approved many (if not most) of the so-called 'barbaric and lifeless' terms that now populate the *Standard Edition* (see Steiner, 2021). It also reminds us of the fact that, by the time Strachey compiled the *Standard Edition*, in the 1940s, 50s and 60s, there was a long-established tradition of translating Freud into English, which Strachey had to take account of. In the case of *Anlehnung*, for example, the tradition stretched back to the early 1920s. Although Strachey himself began translating Freud around that time, this tradition included the contributions of a host of translators that preceded him – such as C. M. Baines in the case of *Anlehnung*. These historical issues, which Riccardo Steiner (1987, 1988*a*, 1988*b*, 1991, 2021) has carefully documented in an epic series of papers, demonstrate just how unfair it is that so much recent criticism has been directed at Strachey, as if he bore sole responsibility for the translation of Freud into English. In fact, some now-standard translations of Freudian technical terms were already appearing in English when Strachey was still a schoolboy, and Jones had already established a formal German/English glossary of Freud's technical terminology by 1913.

We shall return to these issues shortly. The point for now is that, when Strachey translated Freud's psychological language in the manner that he did, he was following the conventions of English scientific writing, and of English psychoanalytical writing, which in many ways differ from those of German science. Here, therefore,

we are concerned with the broader issue of convention, to which we must now turn in detail.

The example of *Anlehnung* introduces questions such as whether translators should faithfully reproduce the conventions of the 'source' language (the one being translated from) or follow those of the 'target' language (the one being translated into). Here we are confronted with a problem which every translator must face. There really are only two ways of solving it; and translators simply must make a choice, for no two languages are alike in respect of their conventions, and even the denotations (let alone the connotations) of their vocabularies. Whichever choice translators make in this respect, they cannot be reasonably criticized for it, for something is lost either way. Freud himself always opted for the latter approach when translating into German and when reviewing the translations of others (including translations of his own work).

It is well known that Strachey opted for the same approach; he chose to represent Freud as if he was an '*English* man of science of wide education born in the middle of the nineteenth century' (*SE*, **1**, xix/*RSE*, **1**, xx; emphasis added). Laplanche and his team of translators, who are responsible for the *Oeuvres complètes de Freud/Psychoanalyse* – the French equivalent of the *Standard Edition* – opted for the other approach; they cast Freud's writing more literally, in a form far closer to the original German. As stated, this is simply a matter of choice. Similar dilemmas occur in all translation – so we need not consider such general matters here.[1] We should concentrate instead on specifically psychoanalytic questions, which the translation of Freud, in particular, raises. Freud discussed some of these questions in *Beyond the Pleasure Principle*:

> We need not feel greatly disturbed in judging our speculation upon the life and death drives by the fact that so many bewildering and obscure processes occur in it – such as one drive being driven out by another or a drive turning from the ego to an object, and so on. This is merely due to our being obliged to operate with the scientific terms, that is to say with the figurative language, peculiar to psychology (or, more precisely, to depth psychology). We could not otherwise describe the processes in question at all, and indeed we could not have become aware of them. The deficiencies in our description would probably vanish if we were already in a position to replace the psychological terms with physiological or chemical ones. It is true that they too are only part of a figurative language; but it is one with which we have long been familiar and which is perhaps a simpler one as well. (Freud, 1920*g*; *SE*, **18**, 60/*RSE*, **18**, 57.)

Anyone who critically evaluates the efforts of a translator of the language of psychoanalysis should start by reading this passage. For Freud here sets out more clearly

1 For a wonderfully lucid discussion of the topic, see Bellos (2011, especially pp. 103–17). He quotes from George Steiner's (1998) authoritative history of translation: 'Over some two thousand years of argument and precept, the beliefs and disagreements voiced about the nature of translation have been almost the same' (p. 251). On the question of literal translation, Bellos paraphrases Octavio Paz's (1990) remark: 'Literal translation is not impossible, but it is not translation' (p. 109). He also makes this amusing observation: 'The project of writing translations that do the least "ethnocentric violence" to the original thus runs the risk of dissolving into something different – a representation of the funny ways foreigners speak' (Bellos, 2011, 56).

than anywhere his own views on scientific terminology and the conventions that attach to it.

A number of inferences may be drawn from this passage. Firstly, it will be noticed that Freud (the Freud whom Strachey is supposed to have 'falsely scientized') believed that the deficiencies in our psychoanalytic terminology would 'probably vanish' if we were already in a position to 'replace the psychological terms with physiological or chemical ones'. Among the many issues which this remark introduces, let me first single out the fact that, once again, Freud was unambiguously aligning psychoanalysis with the natural sciences, and second, that he was doing so not only in a general sense, but also specifically with reference to questions of terminology. As we saw above, Freud clearly viewed his psychoanalytic language as a natural scientific one, but critics of Strachey's terminology have failed to recognize that the conventions of German scientific writing are different from those of English science. The argument therefore cannot be sustained that, because Freud used an everyday, descriptive language in German, his language was not a natural scientific one.

But notice something else that Freud says in this passage. He says that the figurative language of physiology and chemistry is superior to that of psychoanalysis, not because this is a more scientific language, but because 'it is [a language] with which we have long[er] been *familiar*' and because it 'is perhaps a *simpler* [language] as well' (emphases added).

Let us address these two issues (familiarity and the simplicity) separately, in relation to scientific terminology. To avoid getting lost in abstractions, I will again use examples from the list of controversial terms provided at the outset. Let us take the examples of *Ich*, *Es* and *Überich*, which Strachey translated as 'ego', 'id' and 'super-ego'. These are among the best known of Strachey's classical terms, which have drawn so much criticism in the literature.

To paraphrase Strachey's critics (cited in detail in the relevant entries in the Notes which follow): the word *Ich* is the German personal pronoun in the first person singular, and for that reason it has all the qualities of the English word 'I'. As such, the word represents the speaking person, it has the greatest intimacy and immediacy of any term in the German language, and it is one of its most frequently used words. It reflects the developmental achievement of self-awareness, and it necessarily evokes a personal identification in the reader. The *Ich* experiences directly its body and its mind. The use of this term by Freud thus facilitates an intuitive understanding of his meaning, and it invites the reader to think introspectively. None of this can be said for the Latin term that Strachey used: 'ego'.

The opponents of his choice, which include Brandt (1961), Bettelheim (1983) and Ornston (1982, 1985*a*) – three of Strachey's most vociferous critics – all argue that the term removes the most personal of Freud's technical concepts from the realm of direct experience. They also complain that the assertiveness and commitment implied by *das Ich* are absent from 'the ego'. When *Ich* is translated as 'ego', they argue, it is intellectualized and transformed into a cold, abstract term. The lived reality of the 'I' (of 'me') is reduced to a lifeless jargon. The self-referential word thus comes to refer to something that can only be studied from the outside, by impartial observing others. Although other people may indeed have an 'ego', it is hard to take seriously the idea of one's own self as an 'ego'.

Recalling that we are using this example to illustrate an aspect of terminological convention known as familiarity, then readers will hopefully agree – just as was the case for the German *Ich* – that no word could be more familiar to the English speaker than the personal pronoun 'I'. And yet, Strachey chose to translate it, not as 'I' or 'me', but as 'ego'. Why did he do that?

The answer is that here, too, Strachey was following an established convention. It is true that Freud sometimes used the word *Ich* in the vernacular sense, to refer to himself, for example, but in his technical writings he used *das Ich* to refer to a conventional philosophical concept: *the* ego (an abstraction). In this sense, he used the term to distinguish the experiencing subject from its objects – or the 'me' from the 'not-me', as some English psychoanalysts say. This concept denotes the first person from the third-person point of view – it denotes an experiencing part of the mind which is characterized by special functions and attributes, standing for the organized and executive part of the subject. Freud was by no means the first German-speaking thinker to use the term *das Ich* in this abstract sense; in fact, he was following a long and venerable tradition, in which, to mention just a few of his most obvious predecessors, Kant, Goethe, Fichte, Nietzsche, Griesinger and Meynert had all used the same term in this general way.

Thus, for centuries before psychoanalysis was born, the problem of how to translate *das Ich* in English had been confronted repeatedly. By the time that Freud's writings came along, the term 'the ego' was widely accepted as the academic English rendition of *das Ich*, not only in the philosophical, but also in the psychological, psychiatric and neuroscientific literatures. In other words, by the time that Strachey translated Freud, the term 'the ego' had become a *convention* among specialists of several kinds. Strachey would therefore have been quite idiosyncratic if he had decided to render the term differently – if he had rendered it as 'the I', for example (quite apart from the bad English). If Strachey had not followed the established tradition, he would also have obscured an obvious connection between Freud's psychology and the whole of Western philosophy.

This is the sort of connection that Freud had in mind when he said that the scientific advantage which attaches to the terminology of physiology and chemistry is due to the fact that these languages are already familiar to us. Perhaps this long tradition (which made the term 'ego' familiar to any educated person of the nineteenth century) explains why Freud himself, according to the available sources, never objected to the translation of *das Ich* as 'the ego'. When Chase translated the Clark University Lectures, under the direct supervision of Freud, as early as 1908, he used 'the ego' where Freud had used *das Ich*. Perhaps this also explains why, when Freud wrote a letter in English to Jones on February 18, 1919, he himself used the term 'ego' in a place where he would almost certainly have used *Ich* in German. And for those who might think that Freud was in no position to judge the appropriateness of an English term, we should remember Jones's (1959) and Riviere's (1939) assurances to the contrary: Jones declared that Freud 'had an excellent, rather literary command of [English]', and Riviere wrote that he had an 'amazing command of the English language . . . absolute mastery'. (Do not forget that Freud analysed Riviere, which gave her the closest opportunity to assess his grasp of the language.) So here, again, we recognize the weight of convention behind Strachey's choices of English psychoanalytic terminology. Not only was there an established tradition of translating *das Ich*

as 'the ego', but, by the time that Strachey began to prepare the *Standard Edition*, there was a long-standing psychoanalytic tradition as well. Freud went out of his way to reassure Jones that his official 'glossary' was used by colleagues in Vienna working on English translations, including his daughter Anna (letter of February 5, 1921). It would have been strange indeed if Strachey had suddenly elected, half a century into the development of psychoanalysis, to change one of its most conventional terms.

Once Strachey had elected to translate *das Ich* as 'the ego', he could hardly have translated its counterpart *das Es* as 'the it'. And *das Es*, too, had a precedent in German philosophy, in the writings of Nietzsche, and it had also been used in the writings of Schweninger and Groddeck. But the most important precedent (as Strachey himself tells us in the Introduction to his translation of *Das Ich und das Es*) was the existence of its sister term 'the ego'. Strachey writes that the Latin term 'id' was selected 'so as to be parallel with the *long-established* "ego"' (*SE*, **19**, 7 *n.* 1/*RSE*, **19**, 7 *n.* 1; emphasis added). Clearly, the questions surrounding these two terms are inextricable.

Again I would like to point out that the choice of this term was not James Strachey's alone. A formal 'Glossary Committee' was established by the British Psychoanalytical Society (in 1923) to decide such questions, and when the translation of *Das Ich und das Es* was first undertaken, in 1926 – by Joan Riviere, incidentally, not Strachey – it provoked 'a good deal of discussion'. This can be seen in the correspondence from that period, between Alix and James Strachey, John Rickman and Leonard Woolf, and Sigmund Freud and Ernest Jones, respectively. The Stracheys were, in fact, initially opposed to the choice of 'the id', and it was Jones who turned the tide. Note also, once again, the direct and personal involvement of Freud in these English terminological discussions. As he wrote to Jones when justifying his preference that Strachey should translate the *Massenpsychologie und Ich-Analyse*: 'He is near me and I can collaborate with him' (letter of April 12, 1921). Regarding Freud's personal involvement, it is important to note his very high regard for Strachey's translations: 'I think Strachey's translations [are] done with the utmost care for style and truthfulness' (letter to Jones of June 4, 1922). Concerning this letter, and Freud's close cooperation with Strachey when he was producing his first translations, see Forrester & Cameron (2017) and Steiner (2021).

Once *Ich* and *Es* had been translated as 'ego' and 'id' respectively, there was of course little scope for translating *Überich* as 'over-I' or 'upper I' or 'above-me', as Strachey's critics have suggested. And even here there were precedents, such as Münsterberg's use of the term *Überich*, as early as 1908, the translation of Nietzsche's *Übermensch* as 'superman', and the translation by Jones in 1913 of Ferenczi's concept of a *psychische Überbau* by the English term 'psychical superstructure'. If one takes into account all of these antecedents, as well as the precedents of 'ego' and 'id' themselves, it is hard to imagine how Strachey could have translated *Überich* as anything other than 'super-ego' (although I have dropped the hyphen in the *RSE*).

These are the sorts of constraints that the critics of the *Standard Edition* do not need to take account of; for – as is the case in every field of endeavour – the position of the armchair translator is quite different from that of the real translator. Since the real translator also needs to take account of the numerous derivatives of the terms, *Ich*, *Es* and *Überich*, which occur throughout Freud's work – such as, in the case of *Überich* (for example), *Überichanalyse*, *Überichbildung*, *Überichfunktion*,

Überichinstanz, *Überichwiderstand*, and so on – perhaps one can see why terms such as 'I over myself' – which Darius Ornston (1982) has seriously suggested as an alternative to 'superego' – are extremely difficult to sustain in reality. Ornston would evidently have us translate *Überichwiderstand* as 'resistance of the I over myself' rather than 'superego resistance'. These are the kinds of practicalities with which the real translator must contend.

But again, these are general issues. Let us rather return to those aspects of translation which are specific to psychoanalysis. Freud said that the languages of physiology and chemistry are 'simpler' than that of psychoanalysis, and he said that our terminological problems would 'probably vanish' if we were 'already' in a position to use physiological and chemical words rather than psychological ones. A clue as to why he thought this is provided in the first part of the passage quoted above: 'We could not otherwise describe the processes in question at all, and indeed we could not have become aware of them.'

Here Freud is drawing attention to a problem that lies at the very heart of psychoanalytic translation, and at the very heart of psychoanalysis itself. He says that, if we did not use a figurative language to describe the processes that occur deep inside of us, then, not only could we never describe those processes at all, we could not have become aware of them. We will be richly rewarded if we give this sentence of Freud's our close attention. When Freud says that we could not have become aware of these processes unless we applied a figurative language to them, he is alluding to the fact that the processes which concern us most directly in psychoanalysis – namely unconscious mental processes – do not have any perceptual qualities. We can never see, hear or touch the things that are going on at the deepest levels of our souls; we can only know those things indirectly, by associating them with other things, which can become objects of conscious perception. And in psychoanalysis, as we know, both as a science and as a therapy, we 'become aware' of unconscious mental processes by attaching *words* to them. To that extent the very aim of psychoanalysis is to engage in a process of translation. The analyst, who is more familiar with the language of the unconscious than the patient is, assists the patient to effect a translation of inarticulate material which was previously incomprehensible to them. Thus, a symptom, transference, parapraxis or other enactment is gradually transformed into the 'declarative' perceptual language of the ego. And we effect this transformation by making interpretations to the patient. And what is an interpretation, if not a translation? In my view, herein lies the nub of the unique problems of translation that we face in psychoanalysis: we are compelled to find words to describe things that we can never know directly, things that we can never perceive. We are required to find words for things the very existence of which can only be inferred, by way of their indirect effects on conscious perception (and sometimes only by their absence from it).

I would now like to quote two further passages from Freud – again from one of his last works, *An Outline of Psychoanalysis* (1940*a* [1938]) – where he explained this situation rather beautifully:

> Behind the attributes ([or] qualities) of the object under examination which are presented directly to our perception, we [in psychoanalysis] have to discover something else which is more independent of the particular receptive capacity

> of our sense organs and which approximates more closely to what may be supposed to be the real state of affairs. We have no hope of being able to reach the latter itself, since it is evident that everything new that we have inferred must nevertheless be translated back into the language of our perceptions, from which it is simply impossible for us to free ourselves. But herein lies the very nature and limitation of our science. It is as though we were to say in physics: 'If we could see clearly enough we should find that what appears to be a solid body is made up of particles of such and such a shape and size and occupying such and such relative positions.' In the meantime we try to increase the efficiency of our sense organs to the furthest possible extent by artificial aids; but it may be expected that all such efforts will fail to affect the ultimate outcome. Reality will always remain 'unknowable'. The yield brought to light by scientific work from our primary sense perceptions will consist in an insight into connections and dependent relations which are present in the external world, which can somehow be reliably reproduced or reflected in the internal world of our thought and a knowledge of which enables us to 'understand' something in the external world, to foresee it and possibly to alter it. Our procedure in psychoanalysis is quite similar. We have discovered technical methods of filling in the gaps in the phenomena of our consciousness, and we make use of those methods just as a physicist makes use of experiments. In this manner we infer a number of processes which are in themselves 'unknowable' and interpolate them in those that are conscious to us. And if, for instance, we say: 'At this point an unconscious memory intervened', what that means is: 'At this point something occurred of which we are totally unable to form a conception, but which, if it had entered our consciousness, could only have been *described* in such and such a way.' (*SE*, **23**, 196–7/*RSE*, **23**, 177–8; emphasis added.)

> This cannot be effected without framing fresh hypotheses and creating fresh concepts; but these are not to be despised as evidence of embarrassment on our part but deserve on the contrary to be appreciated as an enrichment of science. (Ibid., 158/143.)

If these passages are not too obscure, then readers can see why the problem of translation lies at the heart of psychoanalysis. Freud was, in fact, the first psychoanalytic translator. And we, the translators of Freud, do not merely face the problem of finding the best words in our own languages to match the German words that Freud used; we – like Freud – are faced with the problem of finding the best figurative language to describe the 'unknowable' things occurring inside us, which can never be perceived directly, and which Freud was the first to attempt to describe. Under these circumstances, where we are all groping in the darkness (Freud no less than his translators), who is to decide whether one word or another one is more suited to describing a particular mental process? If we have no objective basis for deciding what the process actually is, then who is to say which word describes it more correctly? I think that this is what Freud had in mind when he said that the languages of physiology and chemistry are 'simpler' than that of psychoanalysis, and this is also what he meant when he said that the deficiencies in our psychological terminology

would 'probably vanish' if we were already in a position to replace it with a physiological and chemical terminology.

By putting words to the unconscious things we study in psychoanalysis, Freud made them available to conscious thought for the first time; and, in doing so, it was almost as if he brought those things into being. Herein lies the awkward ambiguity between discovery and invention in psychoanalysis. And this explains why psychoanalysis has been such a battleground of disagreements from the start. But these are difficulties that we have to live with if we wish to have a science of the mind. As Freud said, we are obliged to operate with the figurative language peculiar to psychoanalysis, for 'we could not otherwise describe the processes in question at all, and indeed we could not have become aware of them'. And if we can all agree that a certain thing really does exist in the unconscious, we still need to be especially careful about the words that we choose to describe it, since we can still never know directly what that thing actually is. So, in psychoanalytic writing, we can only come to know such things by way of the words we use to signify them.

As a result of this peculiar situation, we in psychoanalysis all too easily mistake our words for the things they represent, and then we treat our technical terms as if they were things themselves. Freud was well aware of this danger:

> When we think in abstractions there is a danger that we may neglect the relations of words to unconscious thing presentations, and it must be confessed that the expression and content of our philosophizing then begins to acquire an unwelcome resemblance to the mode of operation of schizophrenics. (1915*e*; *SE*, **14**, 204/*RSE*, **14**, 180.)

Although the conflation of words and things in our theorizing need not reach such extremes as they do in schizophrenia, all of us at times treat technical terms and concepts as if they were the subject matter of our science. That is why I like to say: psychoanalysis is not important, it is *about* something important.

The problem we face is not so much whether *Besetzung* (for example) would be better translated as 'cathexis', or 'activation' or 'charge' or 'engagement' or 'occupation' or 'investment' or 'filling' or 'interest', or whatever; for *Besetzung* itself is all of these things, and it is also none of them. *Besetzung* is not even '*Besetzung*', really. As Freud so aptly put it, the actual thing denoted by this term is 'something . . . of which we are totally unable to form a conception, but which, if it had entered our consciousness, could only have been described in such and such a way'. For example, in 'The Neuropsychoses of Defence' Freud described it as 'a quota of affect or sum of excitation . . . which is spread over the memory traces of ideas somewhat as an electric charge is spread over the surface of a body' (Freud, 1894*a*; *SE*, **3**, 60/*RSE*, **3**, 56). We would do better service for our science if we spent our time considering what this 'something' (of which we are totally unable to form a conception) actually is, rather than debating whether to denote it by this or that figurative term.

On the other hand, it is precisely due to the intangible nature of the objects of our science that we attach so much importance to the words we use to describe them. For that reason – at least to a certain extent – it is inevitable that the figurative terms we choose will come to characterize the things that the words represent.

This brings us back, full circle, to the question as to whether we should use an evocative, descriptive language in psychoanalytical vocabulary, as opposed to an abstract, scientific vocabulary like Strachey's. By now it should be clear that there can be no question of the one approach or the other providing a more correct description of the qualities of the mental processes in question. For we can, quite simply, never know directly what those processes actually are.

Nevertheless, certain advantages attach (in this respect) to a relatively abstract vocabulary. 'Dead' languages – such as those of ancient Greece and Rome – are perhaps especially well suited to the purposes of a science that studies things which lack perceptual appearance. If we use a language that is, for us at least, purely conventional, then we need not be too swayed by the figurative images which the original contriver of our concepts had in mind when he coined his vocabulary. By using an abstract language, we leave our technical terms open – for them to be, as it were, *besetzt* by the figurative images of each new reader.

In any event, by choosing a relatively abstract language, Strachey was at least consistent, not only with the conventions of his own linguistic culture, but also with the natural scientific goals that Freud had set for psychoanalysis. Perhaps a similar reasoning lay behind Freud's decision to formulate his metapsychology in terms of three simultaneous 'points of view' (topographic, economic and dynamic). The concept of multiple, converging viewpoints seems especially suited to the description of 'unknowable' things. If one thinks of the moral about the blind men and the elephant, one sees what advantages this approach can yield.

On a similar basis, some commentators upon the translation of Freud have suggested that we need a flexible technical vocabulary, with a variety of different translations, so that we do not rigidly fix the intangible subject matter of our science into a 'standard' lexicon. However, if one surveys the state of contemporary psychoanalysis, which seems to have created this pluralistic ideal spontaneously, at a conceptual level at least, one cannot help but be reminded of another well-known moral, namely that of the Tower of Babel, where so many languages were in simultaneous use that confusion inevitably ensued (cf. Steiner, 1994).

A good deal is to be gained, in my view, at this point in the development of our science, if we do everything in our power to gain clarity about basic psychoanalytic concepts. When the concepts themselves are so difficult to grasp, even for the most able of minds, it is hard to see what we gain by complicating our task further by creating a gaggle of synonymous words. This is what the concept of a 'Standard Edition' is all about. It aims to harmonize the translation, so that we all know when we are speaking about the same thing and when we are speaking about something different – so that we can focus our attention upon the things rather than the words.

These are the main reasons why I have elected *not* to replace Strachey's terminology with a new one, in the vain illusion that I could somehow create a better translation than he did (with the help of Jones's Glossary Committee, and of the first generation of English translators of Freud, and, especially in relation to Strachey, with the help of Freud himself). Jettisoning Strachey would be throwing out the baby *instead of* the bathwater. I have therefore decided to retain Strachey's translations, and his vocabulary, and to use it in my translations of the *Neuroscientific Works* too, and to make the translations of the fifty-six new Freud texts included in the *RSE* consistent with Strachey's style. (I have 'standardized' the translations of the new

texts, even in cases where perfectly good versions by other English translators were available.) Strachey's translations are *at least* as good as the alternatives. Of course, this does not mean that Strachey's choices make for ideal translations; it means only – to use the language of a famous English psychoanalyst – that he bequeathed us 'good enough' translations. It also means that I could do no better than him.

However, precisely because no vocabulary can describe the subject matter of our science 'correctly', I am appending to my revision of Strachey's translations the lengthy discussion of his renditions of Freud's technical terms which follows. Here, I endeavour to explain how Strachey's choices relate to Freud's German usage, via discussions of the numerous alternative translations that have been suggested in the critical literature, and (where relevant) via reviews of the prehistory of Strachey's translations, describing the choices of his predecessors, both in psychoanalysis and in other fields. This necessarily involves some discussion of the underlying 'things' that the terms represent (or try to represent). Readers are reminded that I have also inserted the original German terms into the translated texts [in square brackets] wherever this seemed appropriate; for example, on every appearance of the term *Nachträglichkeit* and its cognates – even some very remote ones.

Readers are advised that these Notes replace Strachey's 'Notes on Some Technical Terms Whose Translation Calls for Comment', which appeared in the first volume of the *Standard Edition*. This is mainly due to the fact that some of the changes I have made to the translations render Strachey's explanations and defences of his choices redundant (for example, in the case of *Trieb*, which Strachey translated as 'instinct'). For reference purposes, however, I have appended Strachey's original Notes below (pp. 101–3).

Following these Notes, I have provided a list of my Annotations to the revised translations of the individual texts. These 'Annotations to Individual Translations' discuss alternative renditions of some specific titles, words and phrases, etc., as opposed to general technical terms. The first appearance of each term discussed in the 'Notes on the Translation of Some Technical Terms' is marked in the texts themselves by a superscript upper-case [T], whereas the location of the more specific matters discussed in the 'Annotations to Individual Translations' is marked by a superscript lower-case [t].

In addition to these Notes and Annotations, an Index of editorial 'Notes on Terms and their Uses' dealing largely with translation matters, scattered throughout the twenty-three volumes, is provided on pp. 601–6 below. These editorial remarks are located together with the Freud texts, mainly in the form of footnotes, to mitigate risks of misunderstanding by those readers who might not be inclined to consult the technical discussions which appear in my Notes and Annotations in this volume.

Acknowledgements

Acknowledgements are due, above all, to Riccardo Steiner, upon whose published work on the history of the English translation of Freud I have relied very heavily. Riccardo Steiner also made many useful additions to successive drafts of these Notes and Annotations. The same applies to Ilse Grubrich-Simitis, who compiled an extensive report on an early draft, some of the comments in which were then

incorporated into the final version. Patrick Mahony provided a similar report, which was likewise used to improve the final version. In addition to these three individuals, I am grateful to the many other scholars who sent me observations and criticisms over the years – starting with the late K. R. Eissler, but including many others, too numerous to list. This acknowledgement does not imply that they carry any responsibility for the opinions expressed here; and we did not agree on every point.

Finally, I am indebted to my implacable assistants, Paula Barkay and Eleni Pantelis, and to a good many graduate students and others who helped out in various ways.

A
NOTES ON THE TRANSLATION OF SOME TECHNICAL TERMS

abfliessen, *abführen*, *ablaufen*, *ableiten*, *abstossen*, *abströmen*, *entladen*, *entlasten*, *verlaufen*. Ornston (1985*a*, 399–400) claims that Strachey reduced all of these German words, which have subtly different meanings, to the single English word **discharge**. This is not actually true. Interestingly, however, in unpublished correspondence with Strachey, Anna Freud advised him not to translate these words too literally but rather to use 'discharge' or '**release**' throughout (Anna Freud to Strachey, March 27, 1954 [the letter refers specifically to the *Studies on Hysteria*]).

'Discharge', as a strictly technical term, is conventionally equated with *Abfuhr* alone in English psychoanalytical translation (see Alix Strachey, 1943, 1; Laplanche & Pontalis, 1973, 121, 1997, 64; Sandler, 1985, 3). However, Reddick (2003, 243 *n*. 25) argues that *Abfuhr* is better translated as 'release'.

Abwehr. Although, as Steiner (1987, 67–9) tells us, some of the earliest writers on psychoanalysis in English (Onufrowicz, 1895; Michell Clarke, 1896) rendered this term as **suppression** and **warding off**, **defence** quickly became established as the standard translation. Strachey accepted this convention, but warned that it 'gives a more passive impression than the German'. He felt that 'the true sense is given better by "**to fend off**"', which is, in fact, the rendition he always gave for the necessarily active cognate form, *abwehren* (see *SE*, **1**, xxiii/p. 101 below).

Strachey's warning echoes the comments of Brandt (1961, 335), who points out that the German term *Abwehr* refers to an active warding off, **fending off** or even **fighting off** of an aggressor. According to Brandt, the German word has distinct military connotations; it implies counterattack. 'Defence', by contrast, is equivalent to the more passive German word *Verteidigung*, which refers to defence in the legal sense. Had Freud meant his concept to carry these implications, Brandt argues, he would have used the latter German term. However, Grubrich-Simitis (1995) disputes Brandt's claim that *Abwehr* implies counterattack. She points out that Freud would have used the German *Gegenwehr* if he had meant to imply this concept. Moreover, Freud used the terms *Abwehr* and *Verteidigung* interchangeably on at least one occasion (1940*a*; *SE*, **23**, 200/*RSE*, **23**, 180). Even more tellingly, on another occasion he explicitly equated *Abwehr* with the French term *défense* (1895*c*; *SE*, **3**, 79/*RSE*, **3**, 72).

It is interesting to note that when Hanns Sachs translated Freud's (1912*g*) paper, which was written in English, he rendered Freud's use of the word **repulsion** as *Abwehr*.

Bettelheim (1983, 93) goes further than Brandt; he argues that both 'defence' and 'to fend off' (which share the same etymological derivation) encourage the view that

abwehren is directed at something external to the self. On this basis, Bettelheim suggests that *Abwehr* is best translated as **parrying**. The latter is defined in *Webster's* dictionary (which Bettelheim quotes) as 'to ward off or deflect, to turn aside as by a clever or evasive reply or remark' – and this, Bettelheim believes, is closest to what Freud had in mind.

Problems for the descriptive alternatives suggested by Brandt and Bettelheim might arise with the adjectival and other compound usages of *Abwehr*, such as *Abwehrhandlung* ('defensive act[ion]'), *Abwehrhysterie* ('defence hysteria'), *Abwehrkampf* ('defensive struggle'), *Abwehrmechanismus* ('defence mechanism', 'mechanism of defence'), and *–abwehr* (which is usually translated as 'defence against –').

Agieren. Although Alix Strachey (1943, 4) recommends both to **enact** and to **act out** for this term, the latter alternative is employed in the *Revised Standard Edition* wherever *agieren* is used in its technical sense (see Freud's definition; *SE*, **12**, 151/*RSE*, **12**, 149). Since the clinical phenomena covered by the German term nowadays seem to require two different English terms ('acting out' and 'acting in'; see Zeligs, 1957), there are perhaps grounds for using only 'to enact' when translating Freud (cf. Sandler, 1985, 3).

Aktualneurose. Alix Strachey (1943, 4) recommends the use of a hyphen for the standard English translation of this nosographic term, **actual-neurosis**, to avoid confusion with **actual neurosis** in the sense of 'real neurosis'. This recommendation was not followed in the *Standard Edition*, and nor is it reflected in Laplanche & Pontalis's glossary (1997, 56). Since the term *Aktualneurose* means literally **present-day neurosis** (see *SE*, **3**, 279 *n*. 1/*RSE*, **3**, 273 *n*. 1), the potential for confusion could be avoided, and the meaning perhaps better conveyed, by an alternative translation such as **current neurosis** or **contemporary neurosis**.

It is interesting to observe that Freud himself used the hyphenated term **actuality-neurosis**, when writing in English (letter to Jones dated January 27, 1910; Paskauskas, 1993, 42). See also *SE*, **3**, 279 *n*. 1/*RSE*, **3**, 273 *n*. 1, where Strachey points out that Freud first used the term 'simple neurosis' to designate this condition.

Angst. The difficulty of translating this word into English was commented upon long ago by Putnam (Steiner, 1987, 80). Brull (1975, 274) argues that the English **anxiety** conveys too mild an emotion and is too imprecise a term in that, for example, it sometimes denotes 'eagerness'. Rycroft (1968, xii–xiii) and Underwood (2006, 172 *n*. 4) express similar misgivings. Brull (1975), quoting Gaylin (1970), suggests that **terror** or **dread** convey better the weight and passion of the German word. He also suggests **fear**, as does Reddick (2003, 243 *n*. 21), but this is problematical for the reason that 'anxiety' covers both 'fear' and 'panic' (cf. Panksepp, 1998). Reddick (ibid., 265 *n*. 3 and elsewhere) goes further and suggests that, when Freud intended to imply the normal meaning of 'anxiety', he used the German '*Ängstlichkeit*'. It is worth noting that James Strachey did sometimes translate '*Angst vor* –' and '*–angst*' as 'fear of –' (see also Alix Strachey, 1943, 6).

Freud (1920*g*; *SE*, **18**, 12–13/*RSE*, **18**, 12–13) gave a precise definition of the meanings he attributed to the words 'fright' (*Schreck*), 'fear' (*Furcht*) and 'anxiety' (*Angst*), and

he clearly distinguished *Angst* by its expectant and potentially objectless quality (see also *SE*, **16**, 395/*RSE*, **16**, 349; *SE*, **20**, 164–5/*RSE*, **20**, 146). These definitions of Freud's appear to contradict the alternative translations that Brull suggested. However, as Strachey pointed out in an editorial footnote, 'Freud is very far indeed from always carrying out the distinction he makes' (*SE*, **18**, 13 *n*. 1/*RSE*, **18**, 13 *n*. 1; see also Strachey's commentary reprinted below, p. 101). Partly for this reason, Strachey did not find it possible to render the German *Angst* invariably as 'anxiety'; for example, he sometimes translated it as 'fear', '**frightened**' and '**afraid**' (see *SE*, **16**, 392 *n*. 3/*RSE*, **16**, 346 *n*. 3; *SE*, **20**, 165 *n*. 1/*RSE*, **20**, 146 *n*. 1). Reddick (2003, 247 *n*. 9) goes so far as to describe Freud's distinctions between *Schreck*, *Furcht* and *Angst* as 'lexically somewhat specious'. On the other hand, Laplanche (1992, 54) reconfirms the specificity of Freud's usage of *Angst*, and argues that, although *Angst* is used to imply 'fear' in common language, Freud did not use the term in that sense (see also Laplanche et al., 1992, 172). Accordingly, as Reddick (2003, 264 *n*. 3) concedes, 'anxiety' has now established itself in psychoanalysis as a technical term with a meaning somewhat distinct from its ordinary usage.

Strachey discussed this whole question at some length and with considerable erudition in an Appendix to Freud's 1895 paper on 'Anxiety Neurosis' (*SE*, **3**, 116–17/*RSE*, **3**, 104) – a fact which Brull (1975) and Reddick (2003) appear to have overlooked.

Anlehnung. Strachey's rendition of this term (which literally means **leaning on**) by a neologism from ancient Greek roots (**anaclisis**) has attracted much critical commentary.

The most vociferous critic is Laplanche, who describes 'anaclisis' as 'a barbaric and lifeless term' (1991, 403). He argues that, since *anlehnen* is a common German word derived from a human context, the translation as 'anaclisis' is a 'false scientization of Freud' (Laplanche, 1992, 52). He proposes **propping** as an alternative translation (Laplanche, 1976, 16; *étayage* in French). Laplanche (1997, 55) blames the prevalent misunderstanding of the meaning of Freud's term on Strachey's infelicitous translation.

Laplanche (ibid.) was under the impression that Freud invented this term in order to capture the relation between self-preservation and sexuality. However, Solms (1999) notes that Freud used this same descriptive term in his earlier neuroscientific writings. In his (1878*a*) paper on the spinal ganglia and spinal cord of the Petromyzon, he named a previously unknown type of nerve fibre, which attaches itself to the branches of a spinal nerve root but has no independent origin in that root, as *angelehnte Fasern* (i.e. 'leaning-on fibres' or 'anaclitic fibres'). Solms points out that German anatomists typically used everyday, descriptive terms to designate structures which English anatomists named with Latin or Greek neologisms. Thus Strachey's translation might simply reflect differences in the conventions of German and English medical scientific writing. (See the Editor's Introduction to these Notes, pp. 41–9 above, for more on this issue.)

Strachey discussed his translation of *Anlehnung* in *SE*, **14**, 87 *n*. 2/*RSE*, **14**, 76 *n*. 1. There he states that *Anlehnungstypus* literally means 'leaning-on type', and he continues: 'The term has been rendered in English as the "anaclitic type" by analogy with the grammatical term "enclitic", used of particles which cannot be the first

word in a sentence, but must be appended to, or must lean up against, a more important one, e.g. the Latin "*enim*" or the Greek "*δέ*".' (Incidentally, the term 'anaklino' was used by Homer; see Steiner, 2021.)

Strachey by no means uniformly used 'anaclisis' and 'anaclitic'. In fact, Mahony (1992*a*, 31) points out that Strachey's diverse translations of *Anlehnung* and *anlehnen* (e.g. as **leaning up against** [*SE*, **10**, 267/*RSE*, **10**, 201], **attachment** [*SE*, **14**, 87/*RSE*, **14**, 76], **based on**, **support** and **dependence** [*SE*, **16**, 306, 333, 369/*RSE*, **16**, 270, 293, 326]) obscures the pivotal importance of the concept for English-speaking readers. Laplanche (1991, 403) makes a similar point.

Contemporary authors sometimes refer to 'attachment' (cf. Bowlby, 1969) or 'dependence' (Sandler, 1985, 4) in place of 'anaclisis' (see Webber, 2002, xxv). Moore & Fine (1990, 14) even claim that '*anaclitic* signified dependence on the mother'. Underwood's **support-seeking** has similar implications (2004, 62 *n*. 1). Even Steiner (2021) bemoans the fact that Strachey's translation 'does not allow any emotional contact with the meaning of such a warm and important kind of dependency on an external object that the German word *Anlehnung* conveys'. It is therefore important to recall that the attachment or dependence indicated by Freud's usage is that of the sexual drives in relation to the self-preservative drives and not that of the child in relation to its mother (cf. *SE*, **14**, 87 *n*. 2/*RSE*, **14**, 76 *n*. 1; Laplanche, 1976, 16). For this reason, Anna Freud (in unpublished correspondence with James Strachey) strongly opposed the use of 'attachment' for *Anlehnung*. At one point she expressed a preference for '**linkage**' (undated letter to Strachey). Curiously, Strachey nevertheless translated *Anlehnungstypus* as 'attachment type' on occasions, necessitating explanatory footnotes to the effect that the attachment in question was not in relation to an object (see *SE*, **14**, 87 *n*. 2/*RSE*, **14**, 76 *n*. 1; *SE*, **16**, 426 *n*. 2/*RSE*, **16**, 376 *n*. 2).

Reddick (2003, 243 *n*. 27) considers both 'anaclisis' and 'attachment' to be based on a 'startling misunderstanding' of '*sich lehnen an*', which means simply that A 'is modelled on' or 'based on' or 'follows the example of' B. Reddick suggests on this basis that the *Anlehnungstypus* is an '**imitative** type'.

Freud seems to have tacitly approved of 'anaclitic'. In response to a letter from Jones (dated April 17, 1921) suggesting addenda to an explanatory footnote Strachey had penned to his translation of the term, Strachey wrote that he consulted Freud on the matter and was advised to omit the addenda (letter to Jones dated May 18, 1922; Steiner, 1984).

Assoziation. See *Einfall*.

Aufbau, *Bau*, *Bildung*, *Formation*, *Gebäude*, *Gebilde*, *Gefüge*, *Gliederung*, *Ordnung*, *Struktur*, *Träger*, *Überbau*. Something of the variety of meanings carried by this range of German words – all of which were allegedly rendered as **structure** by Strachey – is conveyed by the English equivalents: **construction**, **building**, **form**, **formation**, **edifice**, **pattern**, **framework**, **organization**, **plan**, **structure**, **vehicle**, **superstructure**. Ornston (1985*a*, 408 ff.) argues that Strachey's reduction of this penumbra to a single, fixed equivalent had a baneful effect upon subsequent psychoanalytic theorizing. In fact, Strachey did not by any means invariably translate all these German words as 'structure'. This applies especially to *Bildung*, which,

more often than not, Strachey translated as 'formation'. For a random example of the variety in Strachey's renditions, see *SE*, **3**, 205/*RSE*, **3**, 212, where Freud (1896*c*) speaks of the 'associative and logical framework [*Gefüge*] of the neurosis'.

Steiner (1991, 356) reminds us that it is to Brill, not Strachey, that we owe the introduction of the term 'structure' for this range of German figurative words, and that 'in this respect Strachey generally accepted many of the solutions put forward by Brill [and Jones, and others]'. Ornston, too, does not refer to the fact that Freud himself frequently spoke of the *Struktur* of the *Seeleninstrument* [the structure of the mental instrument] (Steiner, ibid.; see also Hoffer, 1989, 209).

For a comprehensive discussion of *Bildung*, see Gadamer (1975, 9–19) and Berman (1983, 141–59). Interestingly, Strachey's unpublished notes for the General Preface to the *Standard Edition* reveal that he had originally intended to include *Bildung* in his 'Notes on Some Technical Terms Whose Translation Calls for Comment', but he evidently changed his mind.

Auffassung. Ornston (1985*a*) complains that Strachey rendered this German word too loosely, using a wide variety of English equivalents depending on the context (e.g. **view**, **understanding**, **outlook**, **scheme**, **theory**, **realization**, **notion**, **account**, **picture**, **interpretation**, **opinion**). Ornston argues that *Auffassung* has a specific technical meaning, namely **conception**, i.e. the way in which a person begins to interpret an observation or to make a somewhat novel idea his own (ibid., 387). This claim is disputed by Grubrich-Simitis (1995) who points out that *Auffassung* is a colloquial term, the specific denotation of which depends on the context. This vindicates Strachey's policy. He clearly did not consider *Auffassung* to be a technical term, and Alix Strachey (1943) did not include it in her very extensive *New Psycho-Analytical Vocabulary*.

Ornston (1985*a*, 389) and Steiner (1991, 354) discuss a minor additional complication, introduced by the fact that Freud (1912*g*), when writing in English, used 'conception' where he evidently had the German term *Vorstellung* in mind (cf. Strachey, *SE*, **12**, 258/*RSE*, **12**, 253 f.). However, Steiner also reminds us that Freud's (1912*g*) English text was revised by another hand – which implies that he might have merely condoned the term (see Paskauskas, 1993, 133). Incidentally, Strachey sometimes translated *Auffassung* as **idea**, which is also how he frequently translated *Vorstellung*.

Autonomie, *Selbstständigkeit*, *Unabhängigkeit*. Strachey did not translate these terms consistently, for example when referring to the **autonomy** or **independence** of mental functions and structures. The terms are discussed at length by Kobrin (1993) who, however, does not actually criticize Strachey's choices.

Bau. See *Aufbau*.

Besetzung. Strachey himself tells us (*SE*, **3**, 63 *n*. 2/*RSE*, **3**, 57 *n*. 3) that Freud was unhappy when, in 1922, he introduced the invented word **cathexis** (from ancient Greek roots, after 'catechein' [to occupy]; see Steiner, 2021) for Freud's *Besetzung*, which has many, widely different senses in everyday German usage. For Underwood (2004, xliv, 2006, *n*. 8) this invention of Strachey's 'threw professional integrity to the

winds' because it is 'the cardinal sin of translation' to invent a word to convey the presumed meaning of an author. The numerous critics of Strachey's neologism all prefer ordinary English equivalents, such as **charge**, **occupation**, **engagement**, **investment**, **filling** and **interest**.

The critics of Strachey's 'cathexis' argue also that *Besetzung* is an active process, and that the power, vitality, polyvalence, flexibility, accessibility and personal meaning of *Besetzung* are lost in his translation (Brandt, 1961, 335; Rycroft, 1968, xiii–xiv; Brull, 1975, 276; Bettelheim, 1983, 89–90; Ornston, 1985*b*, *passim*; Holder, 1988, 212; Steiner, 1991, 357). Specific attention is drawn by these critics to the military connotations of the German term (cf. occupation, **garrison** [*Besatzung*]), as well as to the dramatic (**casting**) and the electrical (charge) connotations. Grubrich-Simitis (1995) disputes the latter connotation. She points out that 'charge' has a specific German equivalent (*Ladung*). It must also be remembered that *Besetzung* has acquired new meanings in German in consequence of Freud's usage, which it did not have before.

Criticisms of Strachey's tendency to replace polyvalent, everyday German words with precise, technical English ones are not new. For example, in 1959 already, Michael Balint wrote the following to Strachey:

> In a way you are right in calling Freud an extremely careless writer on occasions, but in a way you are wrong. [Strachey had complained to Balint about the ambiguity of the term *Ichbesetzung*, which can mean both cathexis of the ego and cathexis by the ego; cf. *SE*, **12**, 74 *n*. 1/*RSE*, **12**, 64 *n*. 1.] . . . This leads me to a very difficult problem which may be termed the relationship between language and depth-psychology. My problem is to decide what the advantages and disadvantages are of using a precise unequivocal term for a complex and over-determined observation or inference, as compared with using an everyday unprecise word. A very good example of this is the German term 'Besetzung' and the English 'cathexis'. The first is highly unprecise but stimulating; for instance, in my case I associate with it a small gallant corps defending a fortress against the onslaught of the enemy and turning their guns outward and, parallel with it, an Army turned inwards and oppressing the population say, like the Germans did with France, or the Russians are doing now with Hungary. In contrast, the exact English term 'cathexis' does not stimulate me at all. (Unpublished letter dated August 28, 1959.)

By contrast, Meisel & Kendrick (1985, 319–20) have remarked that it may have been the very polyvalence of the German *Besetzung* that motivated Strachey to coin a neologism in the first place. Compare, however, Laplanche (1992, 15), who defends the translator's right to neologize but still rejects 'cathexis'. Nevertheless, Laplanche & Pontalis (1997, 60) do appear to accept that Strachey's translation has now become conventional.

Historically, Riviere used 'investment' and Brill 'occupation' (Steiner, 1991, 366). In an early translation Jones proposed 'engaged', whereas Freud himself indirectly suggested 'interest' (letter to Jones, November 20, 1908; see Steiner, ibid.; Gay, 1988, 465 *n*.; Paskauskas, 1993, 9). The extent to which Strachey pondered the implications of his rendition is amply demonstrated by a long letter, accompanied by a six-page appendix, that he wrote to Jones on the subject (Strachey to Jones, November 27,

1921). This letter is quoted by Ornston (1985*b*, 393–4), who provides a comprehensive discussion of the term.

Ornston believes that systematic study of Freud's usage indicates that he implied by the term a specific kind of psychological 'organizing' or 'holding' function: *Besetzung* for Freud (according to Ornston, 1985*b*, 392) meant '**purposefully mobilizing**' or '**selective activation**'. Ornston also argues that the German term implies 'taking something over and using it in a certain way' (ibid.), a reading which suggests a link between the classical mechanism and a possible phantasy equivalent. This evokes Steiner's (1984, 2021) argument that the German term might have suggested to Melanie Klein the conception of a baby projecting parts of itself into an object, in phantasy, and thereby occupying it.

It is perhaps not without significance, as Strachey tells us, that Freud became 'reconciled to' his neologism in the end; he used it himself in an article written (in 1926, in German) for the *Encyclopaedia Britannica* (see *SE*, **3**, 63 *n*. 2/*RSE*, **3**, 57 *n*. 3; *SE*, **20**, 266/*RSE*, **20**, 249; see also Strachey's letter to Jones dated May 23, 1954). Likierman (1990, 115) is therefore wrong to say that 'cathexis' is a term which Freud himself never used. Interestingly, Freud once advised Strachey against providing an explanatory footnote to the term (Strachey to Jones, letter dated May 18, 1922). Regarding Freud's close cooperation with Strachey when the latter was producing his first translations, see Forrester & Cameron (2017) and Steiner (2021).

Incidentally, Reddick (2003, 270 *n*. 65) finds Strachey's translation of *Gegenbesetzung* as **anti-cathexis** 'misleading'; he prefers **countercathexis**.

Bildung. See *Aufbau*.

Deckerinnerung. Numerous authors have pointed out that Strachey's translation of this term (**screen memory**) sometimes resulted in a loss of subtle allusions in the German text (e.g. Mahony, 1984*b*, 857, 1992*b*, 269; Ornston in Laplanche et al., 1992, 147 *n*. 22). Literally translated, a *Deckerinnerung* is a **cover memory**. Sandler (1985, 5) recommends the latter translation. Underwood (2006, 417 *n*. 57) further observes that we now live in an age when screens are mostly used to render things visible rather than invisible. The same considerations apply to *Deckphantasie* (e.g. *SE*, **9**, 172/*RSE*, **9**, 151 *n*. 1) and *Deckeinfall* (e.g. *SE*, **10**, 215/*RSE*, **10**, 164).

Denkidentität, *Wahrnehmungsidentität*. Alix Strachey (1943, 15) recommends **intellectual identity** for the former term. In the *Standard Edition*, **thought identity** is used, together with **perceptual identity** for the latter term. Sandler (1985, 5, 13) prefers **identity of thought** and **identity of perception**.

Deutung. This word famously appears in its technical sense in the title of Freud's *Die Traumdeutung*, but – of course – it recurs throughout his psychological writings. Bettelheim (1983, 65) has argued that, although the English translation of *Traumdeutung* as 'The Interpretation of Dreams' is not literally incorrect, it is 'by no means a felicitous rendering of what the German title conveys'. About the translation of *Traum* as 'dream' there can be no controversy; it is upon *Deutung* as '**interpretation**' that the question mark hangs.

Bettelheim points out that 'interpretation' is both an English and a German word. But Freud chose not to use this word in the title, and nor did he use *Erklärung* (**explanation**). *Deutung*, Bettelheim argues, has a quite different meaning. According to the *Duden* (the German equivalent of the *Oxford English Dictionary*), *Deutung* refers to an 'attempt to grasp the deeper meaning or the significance of something', while the definition of *bedeuten* includes 'what is its sense, what does it mean, what is behind it [?]'. Bettelheim points out that an '**attempt at grasping for a deeper sense**' is very different from an intention to 'make clear and explicit', to paraphrase the *OED* definition of 'interpret'. However, Steiner (2021) reminds us that interpretations, like translations, are always subjective and limited. (See *Übersetzung* below.) To 'make clear and explicit' is very far from exhausting the meanings of the English word 'interpret'.

Bettelheim also draws attention to the parallel between *Traumdeutung* and *Sterndeutung* (astrology):

> By giving his book a title that he knew must evoke associations to the ancient but still popular superstitious and fantastic attempts to make sense of incomprehensible phenomena, Freud indicated that he did not shun efforts to make sense out of what all serious-minded, scientifically inclined people were convinced was utter nonsense. His title suggests, too, that when analyzing dreams one cannot expect to arrive at anything close to the definitive certainty required in the natural sciences. (Bettelheim, 1983, 67.)

The word *Deutung*, Bettelheim suggests, like the motto with which Freud introduced his dream book (*Flectere si nequeo Superos, Acheronta movebo*) 'warns us that we shall have to enter a world of darkness and uncertainty, a world of chaos that defies clear cut translation and interpretation' (ibid., 69). On this basis, Bettelheim suggests two alternative titles for the *Traumdeutung*, 'A **Search for the Meaning** of Dreams', or 'An **Inquiry into the Meaning** of Dreams' – titles which he concedes are 'awkward'.

Remarkably, Laplanche & Pontalis (1973, 228) argue, from an exactly opposite viewpoint, that the English term 'interpretation' brings to mind subjective and perhaps arbitrary attributions of meaning, whereas *Deutung* 'would seem to be closer to "explanation" or "**clarification**" and, in common usage, has fewer of the pejorative overtones that are at times carried by the English word' (ibid.).

Underwood (2006, iv), who objects that the German and English definite articles are nowhere near equivalent, suggests '**Interpreting** Dreams' as the correct title for Freud's masterpiece.

Steiner (1987, 76) – who describes Bettelheim's objections as 'understandable, if not entirely admissible' – tells us that Brill (in 1909) had initially translated the title as 'The **Divination** of Dreams' (which might have met with Bettelheim's approval). Subsequently, however, he changed his mind, and 'The Interpretation of Dreams' was born. In fact, Jones had used the latter expression in 1910 already (Jones, 1910*b*, 250). Steiner points out that when the new English title was announced in the *Internationale Zeitschrift für Psychoanalyse* (in 1913) it was received 'without the hint of an objection', which suggests that Freud and his early German-speaking collaborators were satisfied with the expression. Indeed, Steiner (1991, 354) adds that Freud himself apparently used the phrase 'the interpretation of dreams' as equivalent to *die*

Traumdeutung in a paper written in English (1912*g*). Steiner (1987, 75–6) also draws attention to the fact that Freud approved Chase's translation of the phrase in these terms in his Clark Lectures, including in one instance where Freud actually referred to the ironic connotations of the term *Traumdeuter*. Freud likewise suggested the translation of *Umdeutungen* as 'twisted reinterpretations' (see *SE*, **17**, 7 *n*. 1/*RSE*, **17**, 7 *n*. 1).

Interestingly, *contra* Bettelheim (see above), Freud did sometimes use the German word '*Interpretation*' in metapsychological contexts where '*Deutung*' would have served equally well (e.g. *SE*, **21**, 237/*RSE*, **21**, 226), in other words as a direct synonym for it.

Dingvorstellung. See *Vorstellung*.

Einfall. Brandt (1961, 336–7), Rycroft (1968, 54) and Bettelheim (1983, 94–6) comment that an *Einfall* is an idea that suddenly occurs to one, as if from nowhere. According to Rycroft (1968) *Einfall* means **irruption** or **sudden idea**, not **association**. 'It seems unrelated to everything else going on at that moment. One feels passive in relation to an *Einfall*' (Brandt, 1961, 336). One's passivity in this respect is emphasized by the fact that the verb corresponding to it is impersonal: *Es fällt mir ein* (it **occurs to me** or it **comes to my mind**). Bettelheim (1983, 95) draws attention to the additional fact that the *Es* (id, literally 'it') here connects the *Einfall* with the unconscious, from whence its impetus came. The German word expresses what the analysand experiences.

The same cannot be said for the standard English translation, [**free**] **association**. An 'association' seems to imply deliberate connections; it is not 'free' in the sense of being determined by unbound (primary) processes. Moreover, the English verb 'to associate' has personal forms which express an action. One associates something with something else. Thus Brandt (1961, 337) argues that, if one asked analysands to freely associate, they would build conscious chains of thought rather than say whatever occurs to them.

Mahony (1979), who provides a comprehensive discussion of both the term and the concept of 'free association' (see especially pp. 158–60), agrees that 'free association' does not do justice to Freud's concept. He makes the idiosyncratic suggestion that there might have existed from Freud's perspective a revelatory link between *Einfall* and *Einsicht* ('insight'; see also Seidenberg, 1971). Mahony (1979) also makes the observation that Freud himself frequently used the alternative and more restricted phrase *freie Assoziation*. There certainly are occasions where Freud appears to use *Einfall* and *Assoziation* as complete synonyms (e.g. 1923*c*; *SE*, **19**, 109/*RSE*, **19**, 99; 1933*a*; *SE*, **22**, 12/*RSE*, **22**, 11). However, Brandt (1961, 336) insists that he used the latter term 'only after having made explicit that he meant this kind of freely occurring thought'; and Steiner (1987, 76) points out that he did so under the temporary influence of Jung's experimental word association studies.

Mahony (1979) reminds us of the fact, neglected by Brandt and Bettelheim, that Strachey himself commented upon the difficulties inherent in the terms *Einfall* and *freier Einfall* on more than one occasion. In 1957 (*SE*, **11**, 29 *n*. 1/*RSE*, **11**, 29 *n*. 1) Strachey remarked that, when it came to *Einfall* alone, he avoided the common but 'question-begging' translation of this word, 'association', even at the price of such

long paraphrases as **the idea that occurred to him**. On the other hand, Strachey observed, when it comes to *freier Einfall*, '"free association" (though still objectionable) is hardly to be escaped'. At another point (1961, in *SE*, **15**, 47/*RSE*, **15**, 42), where Strachey translated the term *Einfall* by the phrase **thing that occurred to him**, he remarked in a long footnote that 'there is no satisfactory . . . equivalent' for the German word. He went on to describe the 'customary' translation (i.e. 'association') as 'an objectionable term, since it is ambiguous and question-begging'. He pointed out precisely the difficulty that later exercised Brandt (1961) and Bettelheim (1983), and explained how and why he translated Freud's various usages of *Einfall*, *freier Einfall* and *freie Assoziation* in the ways that he did. On a third occasion (1955, in *SE*, **18**, 264 *n*. 2/*RSE*, **18**, 254 *n*. 3) Strachey remarked that he was of necessity using the word 'association' in two apparently contradictory senses, and reminded readers that the German *freier Einfall* means literally **an idea occurring to the mind spontaneously**.

The above comments make it clear that, in regard to these terms, as with so many others, Strachey was to a large extent bound by established traditions. That this was indeed the case with *Einfall* and *freier Einfall* is demonstrated by Steiner's (1987, 75) genealogy of their translation (see also Rycroft, 1968, 54). Steiner, in drawing attention to one of Strachey's editorial commentaries upon these terms, remarks that Bettelheim has in this case magnified Strachey's responsibility 'out of all proportion' (1987). He points out also that Freud implicitly approved the use of the English term 'free association' in Chase's translation of his Clark University lectures.

In his (1921*b*) introduction to Varendonck, apparently written in English by Freud, he uses the phrase '**freely wandering thinking**' (*SE*, **18**, 272/*RSE*, **18**, 262).

Sandler (1985, 5), following Alix Strachey (1943, 17), lists *Einfall* as **association (idea that occurs to me)** and *freier Einfall* as **free association**. Laplanche & Pontalis (1973, 169) correctly give *freie Assoziation* as the strict German equivalent of 'free association' in their authoritative dictionary of psychoanalytical terms. In the revised glossary of Laplanche & Pontalis (1997) the German term *freier Einfall* is not listed as a technical term at all. However, they state elsewhere that an *Einfall* is something that 'comes to mind', literally, **what falls into the mind** (1973, 178).

Einfühlung. The English translation for this word is now quite generally accepted as **empathy**. Ornston (1988, 197) and many others remark that, unlike 'empathy', *Einfühlung* is descriptive of the way we recall and sort our own experiences in order to **feel our way into** another person's mental life. Thus the emotional immediacy and direct meaning of the German term is lost in translation; as is a possible theoretical connotation (cf. projective identification).

The Greek etymological root of 'empathy' – like that of 'patient' – is 'pathos' ('to feel' or 'to suffer'), prefixed by 'em–' ('in' or 'into'). 'Empathy' accordingly signifies literally either a '**suffering in**' or '**suffering into**' (Mahony, 1994*b*) in addition to 'feeling into' (Moore & Fine, 1990, 67).

Ornston (1988), Margulies (1993) and Pigman (1995) cite correspondence between the Stracheys (Meisel & Kendrick, 1985, 170–1, 177) which demonstrates their discomfort with 'empathy': 'it is an irle word, elephantine, for a subtle process' (letter from Alix to James Strachey dated January 2, 1925).

Mahony (1994*b*) points out that Strachey did use alternative translations of *Einfühlung* in some instances (notably in the case histories; *SE*, **10**, 157/*RSE*, **10**, 120; *SE*, **17**, 9, 85, 104/*RSE*, **17**, 9, 76, 93; see also *SE*, **13**, 103 *n*. 1/*RSE*, **13**, 98 *n*. 1). In fact, as Pigman (1995, 237) demonstrates, Strachey translated *Einfühlung* as 'empathy' in less than half its occurrences in Freud's writings, and never in a clinical context. Pigman (ibid., 246) suggests that this obscures the fact that the use of empathy was an essential component of Freud's technique. In addition, Strachey never translated *einfühlen* (which occurs eight times) as 'empathize'. Pigman (1995, 244, 251) suggests that this was because he shared Alix Strachey's aversion to what Jones reputedly described as the 'recognized official psychological' English translation of *Einfühlung* (letter from James to Alix Strachey dated January 10, 1925). He therefore translated the word in other ways whenever Freud used it in an apparently non-technical sense. Ornston might be surprised to learn that Strachey very frequently translated *einfühlen* as 'feel our way into' (see Pigman, 1995, 244 *n*. 8). Strachey also translated *Sichhineinversetzen* – which Freud used synonymously with *Einfühlung* – as 'empathy'.

Pigman (1995) – who argues convincingly for the view that empathy was an important concept for Freud – provides a comprehensive discussion both of Freud's usage and of the pre-psychoanalytical origins of *Einfühlung* in German aesthetics and psychology. Of special theoretical interest is the genesis of the term in relation to animism, anthropomorphism and symbol formation. Also of interest is its historical connection with the psychology of Lipps and the philosophical problem of other minds.

Einfühlung was first translated as 'empathy' by Titchener (1909, 21), presumably on the model of 'sympathy' (literally 'feeling with'). It is worth noting that 'empathy' is now sometimes retranslated into German as *Empathie*.

Entmischung. See *Trieb*.

erraten. Freud frequently used this term to denote the activity by which the psychoanalyst constructs a formulation of an unconscious situation. Strachey translated the term by various English verbs such as, for example, **guess** (*SE*, **2**, 295/*RSE*, **2**, 263), **detect** (*SE*, **7**, 116–17/*RSE*, **7**, 103–4), **discover** (*SE*, **7**, 120 *n*. 1/*RSE*, **7**, 106 *n*. 1; *SE*, **18**, 18/*RSE*, **18**, 18; *SE*, **20**, 35/*RSE*, **20**, 30), **divine** (*SE*, **17**, 20/*RSE*, **17**, 18) and **make out** (*SE*, **23**, 258–9/*RSE*, **23**, 234).

Gribinski (1994, 1012 ff.) points out that 'guess' has an important advantage over the other alternatives, in that it conveys the ultimate unknowability of the unconscious. By insisting upon the uniform translation of *zu erraten* as 'to guess', Gribinski draws attention also to the importance for Freud of guessing as a concept in relation to the process of construction in analysis (ibid., 1014–15). He is aware, however, that the English word 'guess' has connotations of randomness which are absent from the German *erraten* (ibid., 1012–13). In support of Gribinski's view, Freud at one point explicitly equated the terms *erraten* and *rekonstruieren* (*GW*, **13**, 411; *SE*, **19**, 196/*RSE*, **19**, 193).

In an unpublished letter to Strachey (September 26, 1962), however, K. R. Eissler concurs in the decision to translate *erraten* by a variety of English words (he suggests 'guess', 'divine' and '**conjecture**'), but he questions the appropriateness of Strachey's 'discover'. Bance (2002, xxx) uses '**interpret**' in addition to 'conjecture'.

Erregung. See *Regung*.

Erziehung. Although this word is usually translated as '**education**' in the *SE* and *RSE*, the German has broader connotations and is more similar to the English '**upbringing**' or '**rearing**' (see also Alix Strachey, 1943, 22; Ragg-Kirkby, 2003, xxvi).

Es. See *Ich*.

Fehlhandlung. See *Fehlleistung*.

Fehlleistung. Although *Fehlleistung* is a neologism in the original German, it has immediate and obvious meaning for German-speaking readers, which is not the case for English-speaking readers of the standard translation from Greek roots, **parapraxis** (Brandt, 1961, 336; Brull, 1975, 276; Bettelheim, 1983, 87).

Literally translated, *Fehlleistung* – which combines two ordinary German words – means **misachievement** (Kaufmann, 1980, 24). Brull (1975, 276) argues for **misaction**. Strachey sometimes translates the German term literally as **faulty function** or **faulty act** (*SE*, **6**, xii/*RSE*, **6**, xv; *SE*, **15**, 25 *n*. 1/*RSE*, **15**, 23 *n*. 2). In Sandler's (1985) notes for a revised glossary, the English equivalents of *Fehlleistung* are listed as **slip**, **parapraxis** and **faulty act** (ibid., 6). 'Slip' is now quite widely used by English-speaking authors (Hoffer, 1989, 209; Ragg-Kirkby, 2003, xxv; Frankland, 2005, xxiii). Bell (2002) in her *Penguin Modern Classics* translation, for example, uses 'slip of the memory', 'slip of the mind', 'slip of the pen', etc.

Interestingly, Freud himself, when writing in English (1921*b*; *SE*, **18**, 271/*RSE*, **18**, 261), used '**defective act**'.

As Bettelheim (1983, 86–7) shows, the two words combined in the original German term are strangely opposite, which has an effect on readers that is lost in the English translation. *Fehl* means 'faulty' or 'erroneous', while *Leistung* suggests 'accomplishment' or 'achievement'. Thus, according to Bettelheim, 'it is a term that gives German readers an immediate, intuitive feeling for the cleverness and ingenuity of the unconscious processes without the readers' losing sight of the fact that the end result of those processes is a mistake' (ibid., 87). Kaufmann (1980, 24) presents similar arguments. On this basis, Bettelheim (1983) suggests that **faulty achievement** would have been a better rendition of the term.

Bettelheim considers Strachey's recourse to Greek particularly unfortunate in this instance, since *The Psychopathology of Everyday Life* is in many ways the most accessible of Freud's works.

As was the case for so many other such terms, 'parapraxis' was, in fact, Jones's invention rather than Strachey's (Steiner, 1988*a*, 185). In this light, it is perhaps relevant that Jones, a neurologist, would have been aware of the close link that existed in Freud's mind between *Fehlleistungen* and the neurological symptom *Paraphasie*, which is always translated as 'paraphasia' in English (see Freud, 1888*b*, 1891*b*,

1893–94*a*, 1901*b*; cf. Solms & Saling, 1990). In this sense, therefore, it could be argued that the English translation, rather than obscuring the context of Freud's term, actually illuminated it. In fact, Steiner (2021) draws attention to the fact that the term **parapraxia** appeared in the 1912 edition of Stedman's famous *Practical Medical Dictionary*, and it is plausible that this was the original source of Jones's suggested translation of Freud's term.

Fixierung, *fixieren*. Strachey considered Freud's technical usage of these terms – which he translated as **fixation** and **fixate** – to have a special psychoanalytical meaning over and above the common usage (see his long footnote on the topic: *SE*, **1**, 125 *n*. 1/*RSE*, **1**, 152 *n*. 1). This is self-evidently true. Huish (2002, xxxii), however, considers Strachey's translation 'a striking example of the way in which we have "jargonized" Freud out of all recognition'. For her, the key sense of the term in ordinary German usage is 'fixed *gaze*'. Huish evidently does not realize that this is the meaning of 'fixation' in neurology – Freud's primary discipline – which Strachey points out has 'no relation, of course, to the psychoanalytic use of the same word' (*SE*, **1**, 80 *n*. 2/*RSE*, **1**, 87 *n*. 1). To reduce Freud's psychoanalytical usage of *Fixierung* to this meaning is surely wrong. Moreover, Huish's view is difficult to reconcile with the fact that Strachey flexibly translated *Fixierung* by other words when Freud used it in a non-technical sense, and when he used it to refer to other technical processes such as **registration** and **recording** (see *SE*, **23**, 160 *n*. 1/*RSE*, **23**, 145 *n*. 1).

genetisch. Some confusion might arise between the **genetic** point of view in metapsychology and the somewhat different perspective of the modern science of genetics (which barely existed in Freud's time). It is perhaps for this reason that Sandler (1985, 6), in his notes for a revised glossary, qualifies the standard translation by adding **developmental** in parentheses. Rycroft (1968, 57), too, considers the psychoanalytic usage of 'genetic' to be synonymous with 'developmental'. On the other hand, it could well be argued that the word *genetisch*, like its English equivalent, means 'pertaining to or having reference to origin'; it does not refer to development as such. The German and the English terms have the same biblical root, of course: 'Genesis'.

Geschlecht. Strachey consistently translates this term with the English '**sex**'. Ornston (1982, 417) argues that this can lead to confusion, since the German term *Sex*

(or *sexuell*) has a more specific meaning than its English counterpart. Whereas the English term refers to both the activity 'sex' and the designation '**gender**', the German term *Geschlecht* usually (but by no means exclusively) carries the latter meaning only. Ornston's implicit recommendation is that *Geschlecht* should have been translated as 'gender' rather than 'sex'. Laplanche (1991, 403–4) expresses a similar viewpoint. The implication seems to be also that Freud's usage of the adjectival form, *geschlechtlich*, implies 'genitally sexual' rather than 'sexual' in its broader psychoanalytic sense. It is, however, important to note that *Sex* (the noun) was not current in German usage before the Second World War. Hence, for example, Hegar's *Der Geschlechtstrieb*, which was reviewed by Freud (1895*i*), would hardly have been translated as 'The Gender Drive'.

Gliederung. See *Aufbau*.

Gruppe. See *Masse*.

Hemmung. This term is always translated as **inhibition** in the *Standard Edition*. Brandt (1961, 337) is of the opinion that the image evoked by the German word is that of something being put into one's way; he argues that it implies an active agent who stops, blocks, checks or hinders something – that the person feels passive, as if something is done to him. 'Inhibition', by contrast (for Brandt), refers to a process occurring within a person; it therefore has an immediacy which is absent from the German term. Brandt suggests no alternative translation.

It is not certain that Brandt's viewpoint is sustainable. *Hemmung*, no less than 'inhibition' in modern usage, can refer to a process occurring within a person (Grubrich-Simitis, 1995). The German term is now even occasionally used in the sense of the English word 'scruple'. There is also a long-standing tradition of translating *Hemmung* as 'inhibition' in the neurological sciences (Smith, 1992, 8 ff.). The prevailing scientific meaning in Freud's time – a meaning derived principally from neurophysiology – was the same as it is today, namely the temporary arrest of a function through the action of a restraining force. The myriad other connotations of the term (in various languages) are fully discussed by Smith (ibid.).

Freud's own understanding of the meaning of '*Hemmung*' is clarified in the opening passages of *Inhibitions, Symptoms and Anxiety* (*SE*, **20**, 87 ff./*RSE*, **20**, 77 ff.), namely the prevailing scientific meaning. Reddick (2003, 264 *n*. 1) reminds us, however, that modern usage of the term owes much to Freud's 'psychologizing' of it.

Ich, *Es*, *Überich*. The rendition of the German vernacular *Ich* and *Es* as the Latin **ego** and **id**, and, to a lesser extent, of Freud's neologism *Überich* as the English **superego** (or **superego**), has been widely criticized. Not all of the critics seem to have read Strachey's own lengthy discussion of these terms, which appears in the Editors' Introduction to *The Ego and the Id* (*SE*, **19**, 7 ff./*RSE*, **19**, 7 ff.).

Ich is the German personal pronoun in the first person singular and thus has all the qualities of the English word **I**, or, as Bettelheim (1983, 55) points out, **me**. However, it is important to recognize (which most of Strachey's critics do not do) that *the* ego

is an abstraction; although *Ich* might mean 'I' or 'me', *das Ich* is a third-person conception, literally 'the I'.

Some authors (Mahler & McDevitt, 1982, 829; Whiteside, 2005, xxxi) consider the *Ich* to be synonymous with the **self**, a term which Glover (1966) famously described as 'journalistic'. Freud sometimes used the term in this vernacular sense, to distinguish the self from the other, but he also used it in the philosophical sense – following Kant, Goethe, Fichte, Nietzsche, Griesinger, Meynert and others – to distinguish a part of the mind which is characterized by special functions or attributes, i.e. the organized, executive part of the mind (Laplanche & Pontalis, 1973, 130–2; Ornston, 1982, 419; Kernberg, 1982, 894–6; Moore & Fine, 1990, 58; Kirschner, 1991, 166; Kobrin, 1993, 201; Spruiell, 1995, 421–3). Although Freud makes clear at one point (1925*i*; *SE*, **19**, 133/*RSE*, **19**, 121) the distinction between the two uses of the German word, Strachey (ibid., 8 *n*. 1/7 *n*. 3) comments that it is not always easy to distinguish them in his writing (see, for example, Strachey's indecision in *SE*, **14**, 293/*RSE*, **14**, 292; *SE*, **24**, 448). Strachey was of the view that the meaning which Freud attached to *das Ich* underwent gradual modification: 'At first he used the term without any great precision, as we might speak of "the self"; but in his latest writings he gave it a very much more definite and narrow meaning' (*SE*, **14**, 71/*RSE*, **14**, 62).

The matter is complicated further by the fact that there exists in German a distinct term for 'the self', namely *das Selbst*, and even more so by the fact that Freud explicitly equates *das Selbst* and *das Ich* in some places (e.g. *SE*, **21**, 65/*RSE*, **21**, 61). In the few instances where the sense demanded it (and often at the prompting of Anna Freud [unpublished correspondence]), Strachey translated *das Ich* as 'the self', which English term he also used for *das Selbst*. In most of these instances, Freud used *das Ich* in a loose sense which seemed to imply the person as a whole – that is, the ego and id combined.

In general, however, Strachey used 'the ego' to cover the colloquial and philosophical senses of the German term *das Ich*. He thus retained the ambiguity of the original in the translation. Laplanche & Pontalis (1973, 132) concur in this decision. However, following certain theoretical developments in American ego psychology (Loewenstein, 1940; Hartmann, 1950; Jacobson, 1964), there has been a tendency among some modern psychoanalysts to distinguish the 'ego' and the 'self': they reserve 'ego' for 'abstract systemic or structural meanings' and 'self' or '**self-representation**' for the 'phenomenal *Ich*' (Spruiell, 1995, 421). English-language metapsychology has thereby acquired 'an embarrassment of riches' (ibid.). This embarrassment is well illustrated by McLintock's (2002, xxv) decision to translate Freud's *Ichgefühl* as 'sense of self'.

Most critics of Strachey's decision to use 'ego' for both of the above-mentioned meanings of the German *Ich* draw attention to the fact that something of Freud's ambiguity is nonetheless lost in the translation, since 'ego' does not retain the colloquial meaning of the German term. 'Ego' has an impersonal quality which seems appropriate for metapsychological theorizing but does not adequately convey the personal connotations of the German *Ich* (Kernberg, 1982, 894). *Ich* represents the speaking person (Brandt, 1961, 333), it has the greatest intimacy and immediacy of any word in the language (ibid., 333; Bettelheim, 1983, 53) and it is one of the most frequently used words in spoken German (ibid., 53). It evokes the developmental

achievement of self-awareness (ibid., 54). The *Ich* experiences directly its body and its being (Weiss, 1950, 15; Brandt, 1961, 333; Rycroft, 1968, xv; Shapiro in Habermas, 1971, 344 *n*. 31; Ornston, 1985*a*, 385). The use of this term by Freud facilitates an intuitive understanding of its meaning and almost forces one to think introspectively and psychoanalytically; the personal identification it evokes perhaps even entices one to side with the *Ich* against the irrational and infantile *Es* (Bettelheim, 1983, 55–6).

That Freud wished to preserve such associations is suggested by the following comment on his choice of the terms *Ich* and *Es*:

> You will probably protest at our having chosen simple pronouns to describe our two agencies or provinces instead of giving them orotund Greek names. In psychoanalysis, however, we like to keep in contact with the popular mode of thinking and prefer to make its concepts scientifically serviceable rather than to reject them. There is no merit in this; we are obliged to take this line; for our theories must be understood by our patients, who are often very intelligent, but not always learned. The impersonal 'it' is immediately connected with certain forms of expression used by normal people. 'It [*Es*] shot through me,' people say; 'there was something in me at that moment that was stronger than me [*Ich*].' (*SE*, **20**, 195/*RSE*, **20**, 173–4.)

This cannot be said for 'ego'. The Latin term removes the concept from the realm of direct and personal experience (Brandt, 1961, 333; Bettelheim, 1983, 53; Spruiell, 1995, 421). It is argued that the assertiveness and commitment implied by the term 'I' is lost in Strachey's translation (Bettelheim, 1983, 55). The *Ich* is said to be intellectualized and transformed by him into a cold technical term, into 'lifeless jargon' (Brandt, 1961, 333; Bettelheim, 1983, 55 f.; Ornston, 1982, 419, 1985*a*, 385). It becomes something that can be studied from the outside by observing others (Shapiro in Habermas, 1971, 344 *n*. 31; Bettelheim, 1983, 54). It also unjustifiably opens Freud's *Ich* concept to the charge of anthropomorphization (Kernberg, 1982, 895). Bettelheim (1983, 54), Spruiell (1995, 421), Bance (2002, xxvii) and Ragg-Kirkby (2003, xxiv) even complain that 'ego' evokes the pejorative, selfish meanings of 'egoism', 'egotism' and 'egoistic' (which, in view of the theory of narcissism, are, in fact, not unrelated to Freud's technical concept of the 'ego'; see, e.g., Freud, 1916–17*a*; *SE*, **16**, 417/*RSE*, **16**, 368 f.). These authors also do not notice that Freud himself did occasionally directly equate the words *Ich* and *egoistisch* (e.g. *SE*, **14**, 52/*RSE*, **14**, 46).

That Freud was aware of some of the complications introduced by Latinizing his terms is suggested by the fact that he felt it necessary in 1927 to annotate the first appearance of the term 'super-ego' in an American translation of his *Autobiographical Study* with this remark:

> It has become customary in the English psychoanalytic literature to replace the English pronouns 'I' and 'It' by the Latin ones 'Ego' and 'Id'. In German we say: *Ich*, *Es* and *Überich*. (Grubrich-Simitis, 1993, 299; trans., 236.)

However, the complication introduced by the *various* usages of the term *Ich* in the development of Freud's writings should also not be forgotten. (At one point, in unpublished notes that Strachey compiled while translating *Civilization and its*

Discontents, he remarked to himself that Freud used the term *Ich* in three or four different senses in that work.)

Importantly, as Steiner (1987, 73) points out, the problem of how to translate *das Ich* did not originate with Strachey (see also Wilson, 1987, 305). Chase, who was directly supervised by Freud, used the term 'the ego', as did Jones and Brill before him, as early as 1908 (Steiner, 1987, 73). The question aroused intense debate when *Das Ich und das Es* was first translated, by Riviere in 1926 (see the exchange of letters between Rickman and Leonard Woolf, cited by Meisel & Kendrick, 1985, 307, as corrected by Steiner, 1988*b*, 406–7; see also the exchange of letters between the Stracheys, cited by Steiner, 2021). The choice of Latin terms was actually opposed by the Stracheys initially, and it was Jones who turned the tide (Ornston, 1988, 202).

Perhaps more importantly, translators were confronted with *das Ich* long before psychoanalysis was born, and, by the time the *Standard Edition* was conceived, 'the ego' was a widely accepted translation in the English philosophical, psychological, psychiatric and neuroscientific literature (Grossman, 1986, 489; Wilson, 1987, 305; Steiner, 1987, 73; Solms & Saling, 1990, 29; Forrester, 1990, 50–1; Crick, 1999, xliv). This reflects the fact, strikingly overlooked by so many commentators, that 'in forming new words, German relies much more on native resources than English does on its Anglo-Saxon heritage' (McLintock, 2002, xxiv). Strachey would have been open to the criticism of idiosyncratic translating if he had rendered this conventional term differently (Wilson, 1987, 305; cf. Shapiro in Habermas, 1971, 344 *n*. 31). The pre-psychoanalytic historical precedents for Strachey's translation are fully discussed by Steiner (1987, 73–5), who provides evidence of an authoritative tradition which had to be acknowledged by Freud's translators (see also Steiner, 2021). This calls into question Ornston's (1982, 419) claim that Strachey's translation cut Freud off from his roots in the science of his time. But Shapiro (in Habermas, 1971, 344 *n*. 31) argues that it did obscure the connection between the models of reflection in psychoanalysis and German idealistic philosophy.

It is perhaps the existence of this long tradition that explains the fact that Freud himself, according to the available sources, did not object to the translation of *Ich* as 'ego' (Steiner, 1987, 73, 75, 1988*a*, 190). Freud also used the term in his correspondence with Jones (see Steiner, 1991, 376, 1993, xxxv; Freud to Jones, letter dated February 18, 1919). Underwood (2004, 12 *n*. 6) does not appear to be aware of this.

Similar, but not identical considerations apply to *Es*. This word is the German equivalent of the English word **it**, the neuter personal pronoun in the third person singular. The words have precisely the same meaning in the two languages and are correspondingly impersonal. The German term also had a technical meaning antedating Freud's usage: as Freud explicitly acknowledged, he derived *das Es* from Nietzsche and from Groddeck (who in turn – as Strachey tells us – borrowed it from Ernst Schweninger). Strachey's critics are not always aware of these facts.

Brandt (1961, 333–4), Shapiro (in Habermas, 1971, 344 *n*. 31), Bettelheim (1983, 53 ff.) and Ornston (1982, 419), among others, have objected to the choice of the Latin term 'id' in favour of the ordinary English 'it' for reasons similar to those given for 'ego' versus 'I'. 'Id', being Latin, does not convey to English-speaking readers the immediate sense of something impersonal acting on the self (Brandt, 1961, 334). The distinction between the 'I' and the 'it', by contrast, is immediately clear to readers – without

explanation – since it relates to their way of talking about themselves (Bettelheim, 1983, 57).

Bettelheim draws attention to other connotations of the German *Es* which 'it', no less than 'id', does not convey. In German the word 'child' is of neuter gender; thus German-speaking readers of the term *das Es* are reminded of the experience of having once been referred to by the neuter pronoun *Es*. This gives the term a personal meaning directly linked to its theoretical one, and thus facilitates an immediate resonance which is lost in the translation. Ornston (1982, 419), too, draws attention to this developmental allusion. He goes further, and claims that an allusion to all human mental activity being simultaneously organized and disorganized is lost in the Latin rendition of the terms *Es* and *Ich*. Reddick (2003, 257 *n*. 28) also draws attention to the 'unnerving sense of a particular and yet unidentifiable, unbiddable presence of force' that *Es* connotes.

As was the case for *Ich*, Strachey tells us that the choice of an English equivalent for *das Es* provoked 'a good deal of discussion' initially (see the Editors' Introduction to *The Ego and the Id*; *SE*, **19**, 7/*RSE*, **19**, 7). The Glossary Committee eventually decided upon 'id' in preference to 'it', '*so as to be parallel with the long-established "ego*'" (ibid., emphasis added). Clearly, the questions surrounding these two terms are inextricably intertwined. Here, too, the Stracheys themselves were opposed to the Latin choice (see letter from James to Alix dated October 9, 1924, and Alix to James dated January 10, 1925, in Meisel & Kendrick, 1985, 83, 176; cf. the Freud–Jones correspondence, Paskauskas, 1993, 596, 598). The extent to which Strachey's critics have blamed him for choices that were, in fact, Jones's cannot be overstated.

Überich is a German neologism created by Freud – possibly on the model of Nietzsche's *Übermensch* (Brandt, 1961, 334; Steiner, 1991, 367). Jones (1957, 305 *n*.) remarks that *Überich* had, in fact, been used before Freud, by Münsterberg (1908), but this was in a different sense, and it is unlikely that Freud was aware of it. There is no colloquial equivalent in English. One might expect, therefore, by virtue of its being an invented word in the German no less than the English, and considering that Nietzsche's *Übermensch* is happily translated as 'superman', that the translation **superego** would be less controversial than 'ego' and 'id' proved to be. But this is not the case; 'superego' has attracted strong criticism, from Brandt (1961, 334), Kaufmann (1980, 100), Bettelheim (1983, 57 ff.), Ornston (1982, 420) and others.

These critics point out that *Überich* combines two everyday German words; it thus conveys all the feeling-tone of 'I' (discussed above) together with the idea of something higher, a higher authority, something **above me**. 'Superego', by contrast, has no inherent meaning for readers; the English term requires explanation. The essence of the problem lies, therefore – as Bettelheim (1983, 57) points out – more with the second half of the compound than the first. The controversy surrounding the translation of the term thus coincides almost completely with that surrounding *Ich*. However, the qualifying half of the compound, too, is considered unnecessarily remote from ordinary usage by some commentators. Thus Brull (1975, 276) suggests **above I** (cf. Underwood, 2004, 12, 2006, 289), Bettelheim (1983, 59) **over-I** (cf. Kaufmann, 1980) or **upper-I**, and Ornston (1982, 420) **I over myself**.

When considering such descriptive alternatives, it is worth remembering that the translator needs also to take account of the numerous compound derivatives of the

term which occur in Freud's work – *Überichanalyse*, *Überichbildung*, *Überichfunktion*, *Überichinstanz*, *Überichwiderstand*, and so on. Translations such as 'I over myself' are therefore impossible to sustain in practice (cf. Whiteside, 2005, xxxii).

Steiner (1991, 367) provides an instructive discussion of the history behind Strachey's translation. Before the invention of the term *Überich* by Freud (1923*b*), Jones (1913*a*) had already translated Ferenczi's *psychischer Überbau* as 'psychical super-structure' and, in 1918, he had translated Freud's *Ichideal* as 'ego-ideal' (Jones, 1913*a*, 2nd ed.). It is therefore readily apparent why he was subsequently led to translate *Überich* as 'super-ego'. In fact, German compounds with the prefix *Über–* quite regularly correspond to 'super–' in English translation (see McLintock, 2002, xxv).

Ichgerecht. This is a neologism that combines the German *Ich* ('I') with *gerecht* ('just', 'fair', 'legitimate'). In the *Standard Edition*, *Ichgerecht* is translated as **ego-syntonic**. Huish (2002, xxxii) considers this translation 'hair-raising'. She suggests instead '**acceptable to the I**'. Brandt (1961, 334) similarly comments that Freud's term conveys the feeling of **something that is really and justly part of me**. This emotional immediacy (according to Brandt) is lost with the term 'ego-syntonic'. Brandt offers no alternative rendition of the term. The validity of these criticisms should be assessed in light of the fact that the German *mundgerecht*, which is equivalent to the English 'palatable', does not have implications of justice or fairness (Grubrich-Simitis, 1995). Mahony (1994*b*) suggests '**ego appropriate**' or '**ego suitable**' as alternative, literal translations for *ichgerecht*. Reddick (2003, 245 *n*. 37), who suggests '**ego-accordant**', points out that 'syntony' was not introduced into psychiatry until 1925. Laplanche & Pontalis (1997, 66) endorse 'ego-syntonic'.

Idee. See *Vorstellung*.

Indifferenz. Where Riviere (in 1959) translated this word (with reference to the analyst's attitude towards the patient) literally as **indifference**, Strachey mainly used **neutrality** in the *Standard Edition*. Noting that Freud never used the German word *Neutralität* in his technical or theoretical writings, Hoffer (1989, 210–11) remarks on the tension between humanistic feeling and scientific objectivity in the term *Indifferenz*. He points out that the 'perhaps more human yet still distant' English word 'indifference' can be used (as in German) to convey the scientific sense of *Indifferenz* – that is, 'impartial to outcome' (ibid., 211). However, Hoffer does not appear to favour 'indifference' over 'neutrality'. Anticipating the present work, he merely calls for an addendum to the *SE* whereby readers can be made aware of such complexities in Freud translation.

Instinkt. See *Trieb*.

Kraft, *Macht*. Ornston (1982, 423) suggests that Strachey's use of the English term **force** is more frequent than, and different from, Freud's use of the equivalent German term *Kraft*. He (Ornston, 1985*a*, 399), citing Brücke (1874) on the different connotations of 'force' in mathematics and physiology, argues that Freud used the term in a metaphorical and animistic sense, as a 'symbol' referring to qualitative and unmeasurable conscious **powers** or **abilities**. Ornston believes that Strachey mistook

Freud's metaphor and represented *Kraft* as an explanatory technical term, 'as if he believed that scientific language was supposed to sound quantitative' (ibid.).

Steiner (1991, 356) notes that Brill (in 1913), long before Strachey, often reduced both *Kraft* and *Macht* (with its nuances of 'power') to 'force'. Grubrich-Simitis (1995) adds that Freud most certainly did intend his use of the terms *Kraft* and *Macht*, in some contexts at least, to have quantitative connotations.

Kultur. Strachey usually translated this noun as **civilization**, and its adjective as **cultural** – thus drawing no real distinction between the words 'culture' and 'civilization'. Bettelheim (1983, 99) is of the opinion that there is a great distinction between the words *Kultur* and *Zivilisation* in German: *Kultur* refers to moral value systems, and to intellectual and aesthetic achievements – in short, to what might be called the Humanities. *Zivilisation*, by contrast, according to him, refers to material and technological accomplishments. Bettelheim says that Freud cherished 'culture' but was highly critical of many aspects of 'civilization'. He concludes that 'there can be no doubt that the difference between *Kultur* and *Zivilisation* was important to Freud' (ibid.).

Strachey, by contrast, was firmly of the opinion that 'Freud made no distinction between the use of the words "culture" and "civilization"' (*SE*, **23**, 201 *n*. 1/*RSE*, **23**, 181 *n*. 1). Consider the following remark, for example, which occurs in *The Future of an Illusion*:

> Human civilization, by which I mean all those respects in which human life has raised itself above its animal status and differs from the life of beasts – and I scorn to distinguish between culture [*Kultur*] and civilization [*Zivilisation*] – presents, as we know, two aspects to the observer. (*SE*, **21**, 6/*RSE*, **21**, 6.)

Strachey draws attention to this passage and to a similar remark towards the end of *Why War?* (*SE*, **22**, 214/*RSE*, **22**, 224), and concludes that it seems unnecessary 'to embark on the tiresome problem of the proper translation of the German word "*Kultur*"' (*SE*, **21**, 4/*RSE*, **21**, 4).

Strachey's conclusion is underlined by the fact that Freud himself suggested 'Man's Discomfort in **Civilization**' for the title of his work *Das Unbehagen in der Kultur* (*SE*, **21**, 60/*RSE*, **21**, 55), and by the fact that he used *Zivilisation* and *Kultur* to express an identical idea in the two different versions of his (1915*i*) essay on death (see Solms, 1993, 30 *n*. 45).

The problematic status of the terms 'culture' and 'civilization' is fully discussed by numerous non-psychoanalytic authors (e.g. Febvre, 1930, 219–57; Pflaum, 1961; Singer, 1968; Gombrich, 1969, 26; Starobinski, 1983, 13–51; see also *Europäische Schlüsselwörter*, **2**, 1967). As Strachey says in his Editorial Note to '"Civilized" Sexual Morality and Modern Nervous Illness' (1908*d*), the question as to whether *Kultur* is to be translated as 'culture' or 'civilization' is an ancient problem (*SE*, **9**, 180/*RSE*, **9**, 158). Bettelheim seems oddly unaware of this.

Lust, *Unlust*. These terms, which Strachey translated as **pleasure** and **unpleasure** respectively, have exercised all of Freud's translators.

Lust might be considered a relatively straightforward term. However, Brull (1975, 277) argues that the English 'pleasure' is too passive and driveless in comparison to the German word, which he says evokes the feeling-tone of the English **lust**, **joy** and **greed** (although he concedes that it is not identical to any of them). Ornston (1985*a*, 407) renders *Lustprinzip* as 'the principle of **pleasure and delight**'. Grossman (1986, 488) defends the translation of *Lust* as 'pleasure' on the grounds of philosophical precedent. Moreover, he points out that Freud (1880*a*), in his translation of J. S. Mill, rendered the English '**pleasure**' by the German *Lust*. Grossman also reminds us that Freud's 'pleasure principle' has non-experiential referents. He argues (*contra* Ornston, 1985*a*) that it should therefore not be translated in overly experiential terms.

Like Strachey before him (*SE*, **7**, 135 *n*. 2/*RSE*, **7**, 121 *n*. 2), Mahony (1992*a*, 36) points out that the German word *Lust* has the double (appetitive and consummatory) meaning of '**desire**' and 'pleasure' combined. Freud himself draws attention to this important ambiguity of the term in *SE*, **7**, 135 *n*. 2, 212 *n*. 1/*RSE*, **7**, 121 *n*. 2, 188 *n*. 1.

The translation of *Unlust* has attracted more attention in the literature. Jones initially used **discomfort** in 1910, but then changed it to '**pain**' (in inverted commas) in 1915, and then again, in 1916, to **unpleasantness**. In the late 1920s, Jones commissioned a lengthy examination of the issue by Flügel (Steiner, 1991, 367). Riviere, in the *Collected Papers*, reverted to '**pain**'. Strachey reserved 'pain' for *Schmerz* and commented at some length upon his choice of 'unpleasure' (*SE*, **1**, xxvi/p. 103 below). In this instance, Brandt (1961, 338) concurred with Strachey, and seems in the process to have indirectly contradicted Brull's criticisms of 'pleasure'. He remarked that *Unlust* is rarely used in modern colloquial German, where it denotes the absence of pleasure or lack of enthusiasm without implying pain; if at all used for a negative feeling, it refers to the mild affective discomfort of reluctance (cf. Bance, 2002, xxxi, 207). Crick (1999, xli), too, accepts 'unpleasure' as 'ingenious and necessary'. Bell (2002), on the other hand, uses '**aversion**', which seems to recognize the double meaning of the root term *Lust* ('desire' and 'pleasure'), and Bance (2002, 207) uses '**dis-pleasure**' – with the hyphen conveying the special usage of the term in contrast to the colloquial sense of 'displeasure'.

It is important to remember that *Lust* and *Unlust* are registered on what Freud described as the internal surface of the system *Pcpt.-Cs.*, whereas *Schmerz* is registered also on its external surface (cf. Solms, 1997*a*). That is, pleasure–unpleasure are affects, whereas pain is a submodality of somatic sensation (which evokes its affect via a separate anatomical pathway).

Macht. See *Kraft*.

Masse. Strachey frequently (but not invariably) translates the German *Masse* by the English word **group** (as in 'group psychology'). However, Bettelheim (1983, 98) argues that *Masse* has the same meaning as the English words **mass** or **crowd**, and that 'group' is equivalent to the German word *Gruppe*. Accordingly, he considers 'group psychology' to be a mistranslation of *Massenpsychologie*. Kernberg (1994, 262) suggests, in addition, **horde** or **mob** – but concedes that the latter term has depreciatory connotations which are absent in the German *Masse*.

Bettelheim points out that Freud (1921*c*) gave armies and members of churches as examples of *Massen* – 'that is, very large numbers of people who do not necessarily know each other and who receive their coherence as a crowd, or mass, only through common acceptance of ideas or leaders' (Bettelheim, 1983, 98). 'Mass', rather than 'group', is therefore what Freud had in mind, according to Bettelheim. This viewpoint appears to be supported by the fact that Freud himself, when writing in English, once referred to the book that Strachey translated under the title '*Group Psychology and the Analysis of the Ego*' as '*Psychology of Mass and the Analysis of the Ego*' (Freud to Jones, letter dated August 2, 1920; Paskauskas, 1993, 388; cf. ibid., 612). Bettelheim complains of Strachey's rendition that 'no justification is given for considering "group" and "mass" as equivalent terms – which, of course, according to both common usage and the dictionary definitions, they are not'. Bettelheim concludes: 'readers who turn to this book to learn about group psychology will be sorely disappointed' (1983, 98). Kernberg (1994, 257) expresses similar views. It is evident that for Bettelheim and Kernberg 'group' implies a relatively small number of people, and that larger groups which constitute churches and armies and the like should not be called 'groups'.

Contrary to Bettelheim's assertion, Strachey (*SE*, **18**, 69 *n*. 1/*RSE*, **18**, 67 *n*. 1) offered explicit justification for his translation: he explained that it was Freud himself who used the German term *Masse* as synonymous with the English word 'group', as evidenced in his repeated references to McDougall's (1920*a*) book *The Group Mind*. Freud consistently translates McDougall's 'group' by the German term '*Masse*', in contrast to McDougall's 'crowd' which he translates as '*Haufen*'. For example, Freud writes:

> In the simplest case, he says, the 'group' ['*die Masse (group)*'] possesses no organization at all or one scarcely deserving the name. He describes a group of this kind as a 'crowd' ['*einen Haufen (crowd)*']. . . . Before the members of a random crowd ['*Haufen*'] of people can constitute something like a group ['*massen*'] in the psychological sense, a condition has to be fulfilled: these individuals must have something in common with one another, a common interest in an object. (*SE*, **18**, 83–4/*RSE*, **18**, 79–80; cf. *GW*, **13**, 90.)

Hence, on this occasion, Strachey was not only confronted with an established usage in the anthropological literature of the English word 'group' in this sense (i.e. McDougall, 1920*a*), but he was also constrained by Freud's own usage of the English term. This constraint is unaffected by Kernberg's (1994, 261) point that McDougall distinguished between different types of group formation, according to degrees of organizational structure. Freud makes clear throughout his *Group Psychology* that he intended the term *Masse* to cover the widest possible range of group formations, small and large, temporary and enduring, led and leaderless, etc.

It is not difficult to see why Strachey conceded elsewhere that the German word *Masse* has a very wide meaning, and that it is translated as 'group' in Freud's *Group Psychology* 'for special reasons' but is translated differently in other places (see *SE*, **21**, 7 *n*. 1/*RSE*, **21**, 7 *n*. 1). Strachey's critics frequently overlook such nuances.

For a full discussion of Freud's usage of this term, see Laplanche et al. (1992, 145). See also Steiner (2021) who cites a letter from Strachey to Jones dated May 18, 1922,

wherein the translation of *Masse* as 'crowd' is considered. It is, perhaps, also worth noting that Freud, in referring to Strachey's first translation of his *Massenpsychologie*, wrote to Jones: 'I found it absolutely correct, free of all misunderstandings' (letter dated July 14, 1921, quoted in Steiner, 1988*a*, 190). This is not at all surprising, considering the fact that Freud had worked closely with Strachey on the translation; as he wrote to Jones in this connection, 'he is near me and I can collaborate with him' (letter of April 12, 1921).

Mischung. See *Trieb*.

Motiv. Ornston (1985*a*, 401) argues that Strachey sometimes translated this term, which has rather precise philosophical connotations (motives vs. reasons vs. causes), too loosely (see Shope, 1973; Grünbaum, 1984; Wilson, 1987). For example, in *SE*, **16**, 336/*RSE*, **16**, 296, *Motiv* is translated as **reason** and **factor**; and in *SE*, **14**, 179/*RSE*, **14**, 158, '*der Motivierung der* . . .' is translated as 'the **setting off** of . . .'. On the other hand, Alix Strachey (1943, 44) recommends **motive force**, **motive** and **motivation** (in addition to **motif**, which is an alternative meaning also carried by the German term). Curiously, however, James Strachey used 'motive force' for '*Triebkraft*' (which is almost always translated as 'driving force' in the *RSE*). In a letter to Jones dated May 18, 1922, Strachey insisted that *Triebkraft* means 'motive force' or 'living power' and *not* 'instinctive force' (with 'not' underlined by him). Grubrich-Simitis (1995) points out that, notwithstanding the precise philosophical connotations of *Motiv*, when this German word is used in a non-philosophical sense it is a colloquialism that requires different English translations in different contexts.

Confusingly, Reddick (2003, 246 *n*. 11), who is under the impression that Strachey 'routinely' translated *Motiv* as 'motive', complains that this rendition is potentially misleading for the reason that 'motive' refers to the *purpose* of the act, whereas '*Motiv*' in Freud's usage 'almost invariably seems to be a quasi-scientific, not to say mechanistic term meaning "motive force", thus relating to the *generation* of an act or event, not to any supposed purpose'.

Nachträglichkeit. Ever since the significance in Freud's writing of the concept designated by this term was emphasized by Lacan (1953) and Laplanche & Pontalis (1968), the difficulties inherent in its translation – in both French and English – have aroused much controversy and discussion.

Strachey usually rendered *Nachträglichkeit* as **deferred action** and *nachträglich* as **deferred**, but he also frequently used other adjectives, adverbs or adverbial phrases, such as **in a deferred fashion**, **deferred effect**, **after-effect**, **subsequently**, **belatedly**, **in arrears**, **in retrospect** or **later** (Thomä & Cheshire, 1991, 407; Laplanche, 1992, 220). His translation therefore lacked consistency and the concept is difficult to trace in the *Standard Edition*. Mahony (1984*a*, 90–1) discusses some specific examples of this sort. Laplanche (1997, 55) laments Strachey's failure to find a single and well-chosen rendition of this important and original concept.

It should be emphasized that Strachey's *SE* translation was nearly completed before the theoretical significance of the concept was recognized. This is demonstrated by the fact that *Nachträglichkeit* was not listed as a technical term in Alix Strachey's (1943) *New Psycho-Analytical Vocabulary*. The same applies to the indexes

of the *Gesammelte Werke* (until 1968) and the *Studienausgabe*. These facts cast a different light on Wilson's (1987, 301) suggestion that Strachey's translation is responsible for the neglect of this concept in Anglo-American psychoanalysis. There is evidence to suggest that Strachey did make an attempt to 'standardize' his translation of the term after 1962 – at which point, for example, he changed 'a memory . . . which becomes a trauma **only after the event**' (*nachträglich zum Trauma geworden ist*) to 'become[s] a trauma **by deferred action**' (cf. *The Origins of Psycho-Analysis*, 413, and *SE*, **1**, 356/*RSE*, **1**, 380; Thomä & Cheshire, 1991, 410).

The possible shortcomings of the standard rendition are thoroughly discussed by Thomä & Cheshire (1991, *passim*), Laplanche (1992, 217–23) and Mahony (1994*a*). (See also Laplanche & Pontalis, 1973, 111–14, who discuss in addition the problems implicit in the concept itself.) Thomä & Cheshire argue, firstly, from the purely grammatical viewpoint, that 'deferred **activity**' or 'deferred **activation**' would be more correct than 'deferred **action**' since *Nachträglichkeit* is an abstract noun. (Cf. Mahony, 1996, 112: 'deferred **effect**'.) But more importantly, in Thomä & Cheshire's view, both the connotation and denotation of the German term 'are so different from those of "deferred action" that we regard Strachey's rendering as in many ways misleading' (1991, 407). For example, they claim that the German word – via *nachtragend* – carries connotations of revenge and grudge (ibid., 422; Laplanche, 1992, 42), which are absent from 'deferred action'.

These commentators argue further that 'deferred action' represents adequately only one of the multiple facets of Freud's concept, namely, the notion that a psychical event may have traumatic (or other) consequences subsequent to the event itself. That is, an event, registered as a memory, may predispose the subject to a certain reaction, but the actual occurrence of that reaction is dependent upon the supervention of certain other events. The reaction is therefore **deferred**, pending those events. Problems arise, however, from the fact that these commentators want to include under the concept of *Nachträglichkeit* the notion that the supervening events may induce a rearrangement (or at least a reassessment) of the memory traces of the original event (cf. Jung's 'retrospective phantasies' [*Zurückphantasien*], but see also Laplanche, 1992, 219–20, and consider too the modern neuroscientific concept of 'reconsolidation'). From this perspective, emphasis falls on the fact that the later events can involve a revision of the original event and endow it with a power that it did not possess before. In this case, it could be argued that the effect has not been 'deferred', it has been generated *de novo*. Although, as Laplanche (1992, 219 ff.) points out, both of these aspects can be reduced to a single, strictly deterministic theory, this usage makes it necessary to look for English words that are able to accommodate both the 'deferred' and the 'retrospective' aspects of the concept. *Nachträglichkeit* refers to 'not only a "deferred action" from the past in the direction of the present, but also the reverse. Neither of these two "arrows of time" should be neglected' (Laplanche, 1997, 55).

Of relevance here, however, is the viewpoint that the original specificity of the term in its technical sense in Freud's writings (where it applied only to memory traces of childhood sexual scenes) has been broadened by contemporary commentators. For example, Mahony (1994*a*) points out that Freud at one point actually objected to the conflation of *Nachträglichkeit* with the process of retrospective

sexualization (Jung's *Zurückphantasieren*) of innocent childhood events (*SE*, **17**, 95–6/*RSE*, **17**, 86).

It is difficult to find a single English word which conveys the total sense of *Nachträglichkeit*. This difficulty exists for the original German term too: when the native German speaker first encounters Freud's *Nachträglichkeit* (a rare noun), 'they know that he means some sort of "carry-after-li-ness", [but] they will not know *what* sort without reading Freud's expository context and the glosses of technical commentators' (Thomä & Cheshire, 1991, 423–4). The problematic status of *Nachträglichkeit* is reflected in the range of alternative translations that have been proposed in the literature: **retroaction** (Lacan, 1953), **delayed reaction** (Stewart, 1967), **delayed response** (Wilson, 1987), **retrospective attribution**, **retranscription** (Modell, 1994), **posteriorisation**, **retroactivity**, **retroactivation**, **retroconstruction**, **hysterogenesis**, **hysteresis**, **palinergy**, **postference**, **postportation** (Thomä & Cheshire, 1991), **subsequentiality** (Underwood, 2006), **subsequent supplementary response** (Mahony, 1992*a*) and **afterwardsness** (Laplanche, 1992, 1997). The last term, which also offers a simple adverbial equivalent for *nachträglich* (**afterwards**; see Laplanche & Pontalis, 1997, 55), probably comes closest to the German original and fits most cases of Freud's usage. Sandler et al. (1991, 138 *n*. 5) suggest that the French term ***après-coup*** be used in English translations, 'as it does not seem possible to find a suitable English equivalent'. It is unclear, however, why a French term is better than the original German one in an English translation.

Mahony (1984*a*, 117 ff.) is of the opinion that *Nachträglichkeit* ranks alongside those words which Freud regarded as primal and having antithetical meaning. He does not present evidence for this viewpoint.

In the *RSE*, all possibly (even remotely) relevant instances of the German word *Nachtrag* and its cognates are identified in square brackets. Our aim in doing this is to give English-speaking readers a sense of the theoretical and linguistic complexities raised here. This does not by any means imply, however, that all the instances we have identified relate directly to Freud's technical concept.

Ordnung. See *Aufbau*.

Person. Ornston (1982, 414, 1985*a*, 387) points out that Strachey sometimes translated this word in a technical sense – as **case**, **subject**, **figure**, **analyst** or **author** – in places where Freud might have wished specifically to use the more familiar everyday word **person**. (Cf. Wilson, 1987, 304.) However, Grubrich-Simitis (1995) points out that the German word has a variety of senses which demand a variety of English translations, depending on the context.

Phantasie. Freud exploits the ambiguity of this German term, which has a range of everyday and technical meanings. The complexity of Freud's usage is fully discussed by Laplanche & Pontalis (1968, *passim*, 1973, 314–19; see also Lagache, 1964; Sandler & Nagera, 1964; Segal, 1964).

Isaacs (1948, 80) recommends that a distinction be drawn between the technical psychoanalytical concept, **phantasy** – 'essentially connot[ing] *unconscious* mental

content, which may or may not become conscious' – and the everyday word, **fantasy** – 'meaning conscious day-dreams, fictions, and so on'. Laplanche & Pontalis (1973, 318 *n*. ß) argue against this recommendation. They point out that such a distinction does not exist in Freud's conception of *Phantasie*, and that its retrospective introduction in translation would open the door 'to the most arbitrary of interpretations' (ibid.; see also Laplanche & Pontalis, 1968, 11 *n*. 24). Comically, in their encyclopaedia of psychoanalytic terms and concepts, Moore & Fine (1990, 108) simply remark that 'fantasy . . . is spelled *phantasy* in Great Britain'.

Most American authors use the 'f' spelling exclusively (Rycroft, 1968, 50, 118; Laplanche & Pontalis, 1973, 315). In the *Standard Edition* translation, on the other hand, the 'ph' spelling is used throughout. Although the word 'fantasy' therefore appears nowhere in the *Standard Edition* (cf. Guttman 1984, **2**, 674, **4**, 820 f.), the problem of interpretation has not been entirely avoided. Strachey did sometimes translate *Phantasie* by other English terms. The rendition of the essay title '*Der Dichter und das Phantasieren*' (Freud, 1908*e*) as 'Creative Writers and **Daydreaming**' illustrates the extent of the problem thus introduced. Mahony (1994*b*) points out that in the latter essay Freud specifically mentioned a whole series of phantasy acts, only one of which is daydreaming. (It is of interest to note that Strachey listed the latter essay in unpublished documents pertaining to the *Standard Edition*, prior to publication, under the abbreviated working title of 'Poet & Phant'.) It is also interesting to note that, when writing in English, Freud typically used the 'ph' spelling for 'phantastic' (see Freud, 1921*b*; *SE*, **18**, 272/*RSE*, **18**, 262, and his letter to Jones dated August 11, 1912; Paskauskas, 1993, 151).

regen. See *Regung*.

Regung, *Erregung*. In technical contexts, Strachey usually translated these terms as **impulse** and **excitation** respectively.

In regard to *Regung*, Ornston (1982, 414) objected that, by using 'impulse', Strachey cut off Freud's metaphor from the neurophysiology of his time. Ornston believes that Freud had a diffuse arousal process in mind. He further points out that, where Freud did use the German word *Impuls*, Strachey translated it as 'tendencies'. This is, in fact, not correct; Strachey usually translated it as 'impulse' and explicitly commented on the identity of meaning of *Regung* and *Impuls* in Freud's writing (see *SE*, **1**, 254 *n*. 6/*RSE*, **1**, 281 *n*. 4). Alix Strachey (1943, 33), however, gives 'impulsion' as the English equivalent of *Impuls*. Mahony (1996, 411) argues that 'impulse' is more definite and amplifying than *Regung*, and argues that Strachey's translation has prevented English-speaking readers from recognizing the centrality and powerful implications of *Regung* in Freud's vocabulary. Whiteside (2006, xxix) defends Strachey's choice: 'in the end it can only mean impulse'.

In regard to *Erregung*, Ornston (1982, 413) comments that it means both physiological excitation and mental excitement. In medicine and in general usage, an *Erregung* is a relatively raw response which may be stirred up in a person by anything. Underwood (2006, lvii), in apparent agreement, translates it as '**arousal**', which seems an excellent choice.

In regard to *regen*, Ornston (1982, 413) objects that, by varying his translation with the context, Strachey 'broke up Freud's delicate harmonic'. Underwood's

equivalent, for example, would be **arouse**. However, Ornston seems to imply that Strachey should have used **stirring** and **stir** for these two German terms (see also Holder, 1988, 213, 1992, 83 f.). Mahony (1996, 411) concurs with Ornston's suggestions, and points out that a *Regung* is a **beginning of a movement**. Similarly, Laplanche & Pontalis (1973, 223) point out that Freud consistently used *–regung* in compound terms with the same connotation, i.e. that of '**internal movement**'. Strachey did, in fact, frequently translate *regen* as 'stirring' when the word was used in non-technical contexts.

Grubrich-Simitis (1995) concurs with Strachey's decision to vary his translation of these terms, which, as she points out, have many denotations and connotations in addition to the physiological ones.

Sachvorstellung. See *Vorstellung*.

Schaulust. Although Bettelheim (1983, 90) admits that it is difficult to find a single English word to express what Freud had in mind with this term, he feels that 'the monstrosity contrived by Freud's translators and perpetuated in the *Standard Edition* – **scopophilia** – certainly conveys nothing at all'. He suggests that something in the order of **sexual pleasure in looking** or **lust in looking** would convey directly what is meant by the German word. Actually, Strachey did use this descriptive phrase on some occasions (e.g. *SE*, **7**, 157/*RSE*, **7**, 140, and *SE*, **10**, 106); but see also Strachey (1963, 229) regarding the 'haphazard way in which the term *Schaulust* was rendered into English' by previous translators (see Paskauskas, 1993, 78 *n*. 3). Steiner (1987, 78) points out that Freud's earliest translators also followed a descriptive approach. Chase used **exhibition pleasure** in his translation of the Clark University lectures (supervised by Freud), and this example was followed by Brill. Interestingly, Anna Freud criticized this approach with the remark that *Schaulust* is the **urge to see**, not pleasure in seeing (in her unpublished corrections to the page proofs of Strachey's translation of the Leonardo study).

Mahony (1992*a*, 36–7) draws attention to the fact that the noun *Schau* can have the meaning of 'showing' or 'exposing' (cf. *Zeigelust*) as well as the sense of 'looking', when used as a verb. *Lust*, likewise, has the double meaning of 'desire' and 'pleasure' (see the entry for this term, above). We are not surprised, then, to come upon Freud's usage of *Schaulust* in a general sense, to include both its active and passive forms (ibid.; cf. *SE*, **10**, 106/*RSE*, **10**, 82). This creates problems for the apparently simple solution of '**voyeurism**' suggested by Frankland (2005, xxii).

Strachey himself was unhappy with the term 'scopophilia', which was not of his own choosing: 'I must admit the Glossary Committee disgraced itself lamentably over the translation of *Schaulust*' (Strachey, 1963, 229). The Committee's decision to coin a neologism was, no doubt, partly influenced by the need to translate derivative compounds such as *Schauperversion* ('scopophilic perversion') and *Schautrieb* ('scopophilic drive').

It should be noted that the standard translation of *Schaulust* is 'scopophilia' and not '**scoptophilia**' (with a *t*) – although the Glossary Committee did fleetingly propose the latter (erroneous) translation, and although it remains in wide usage in the psychoanalytic literature (see Forrester & Cameron, 2017, 606 *n*. 367).

Schauplatz. Strachey typically translated this term as '**scene**' – but when it relates to psychical topography, he used '**locality**'. It is claimed that this obscures theatrical connotations of the German term *Schauplatz* which are important to some modern theorists (especially in France) who evoke the image of a subjective **theatre** in their conceptualizations of the inner world (see for example Gribinski, 1994, 1016). However, *Schauplatz* does not have theatrical connotations in normal German usage; it simply means '**scene of action**'.

Schicksal. Depending upon the context, Strachey translated this term by the English synonyms '**vicissitude**', '**history**', '**fate**', '**fortune**', '**lot**', '**future**' or '**destiny**' (see Alix Strachey, 1943). In 'Drives and their Vicissitudes' (Freud, 1915*c*), and always in relation to 'drive' (*Trieb*), the first of these alternatives was used. It is worth noting that the original English title 'Instincts and their Vicissitudes' was coined by Baines, in 1925, not by Strachey.

The term 'vicissitude' has been criticized by Bettelheim (1983, 105) and Holder (1988, 213) as being too abstract, too impersonal and too 'bookish'. Holder finds Strachey's decision to use it 'incomprehensible', and suggests 'fate' instead. Mahony (1992*a*, 32), who suggests '**destinies**', similarly argues that *Schicksal* has a certain deterministic note which is lost in Strachey's translation. Frankland (2005, xxiii) adds that *Schicksal* was 'laced with connotations' for Freud, a writer whose erudition evokes the literary concept of 'fate' in classical tragedy and the Greek Fates themselves. For Frankland, who incorrectly assumes that Strachey introduced 'vicissitude', it is 'such a gratuitous distortion that one cannot help suspecting it belongs to a more general attempt to remove the trace of some of the more humanistic sources of Freudian theory' (ibid.).

Bettelheim, by contrast with Holder and Mahony, feels that 'fate' and 'destiny' carry connotations of inevitability which do not attach to the German *Schicksal* (or to the English 'vicissitude'). For that reason, Bettelheim argues, Strachey should have used '**change**' or '**mutability**'. He accordingly suggests '**Drives and Their Mutability**' as an alternative title for Freud's (1915*c*) paper. It is noteworthy that all these criticisms and alternatives seem to cancel each other out. As is so often the case in translation as a whole, there is no 'correct' English equivalent for *Schicksal*.

Seele. The translation of this term by the English **mind** has drawn wide criticism (e.g. Brull, 1975, 275; Bettelheim, 1983, 70–8; Ornston, 1985*a*, 396; Steiner, 1987, 77–8). Many commentators suggest that **soul** would have been a better translation. It is variously argued that the English term 'mind' is too weak and passionless (Brull, 1975, 275), that it fails to convey Freud's humanism (Bettelheim, 1983, 71; Cheshire & Thomä, 1991, 430), that it overemphasizes cognitive and intellectual functions at the expense of the emotional (Brull, 1975, 275; Bettelheim, 1983, 71), that it implies something conscious (Brull, 1975, 275; Bettelheim, 1983, 75–7), that it is insufficiently ambiguous and resonant (ibid., 77), and that it excludes the metaphysical connotations of the German term (Brull, 1975, 275; Ornston, 1992, 64; Laplanche et al., 1992, 177; Webber, 2002, xxv). In addition, Rycroft (1968, 91), following Brierley (1951), emphasizes that psychoanalysts regard 'mind' as a process and not a thing.

Bettelheim (1983) and others argue that the English terms 'mind' and 'mental' have exact German equivalents, *Geist* and *geistig*, which Freud would have used had he

intended to convey something with such attributes. (The same argument could be made against Huish (2002), who translates *seelisch* as **inner**.) Whiteside (2005, xxxi) equates '*Geist*' with 'intellect'. In the *Standard Edition*, however, *geistig* is sometimes translated as 'intellectual', sometimes as 'mental' and sometimes as 'spiritual', depending on the context (see also Alix Strachey, 1943, 26). In this respect, special difficulties arise with the translation of '*Geistigkeit*' in *Moses and Monotheism* (1939*a*; see *SE*, **23**, 86 *n*. 1/*RSE*, **23**, 79 *n*. 1).

When translating from English to German, Freud himself rendered 'mental movement' as '*Regung des Geistes*' (1920*b*). However, Steiner (1991, 354) draws attention to the fact that, when writing in English (1912*g*), Freud appeared to use 'mind' for both *Seele* and *Geist*, despite their different connotations in German. He was certainly sensitive to the difference between *Seele* and *Geist*, though; otherwise it would have been redundant for him to specify 'the claims of the human intellect [*Menschengeistes*] and the needs of the human mind [*Seele*]' (1933*a*; *SE*, **22**, 159/*RSE*, **22**, 140). At another point, though, Freud (1927*c*; *SE*, **21**, 18–19/*RSE*, **21**, 17) refers to 'the spiritual [*Geistige*] part of man, the soul [*Seele*]'. Bettelheim's approach would have this last sentence – which occurs in the context of a discussion of life after death – translated as 'the mental part of man, his soul'. This sentence alone makes clear why Strachey found it necessary to vary his translation of these terms depending upon context.

It is nevertheless noteworthy that Freud, in his (part-English) correspondence with Jones, regularly used the English word 'soul' where he would almost certainly have written *Seele* in German (see Steiner, 1991, 355, 376, 1993, xxxv). Steiner suggests that the inconsistency in Freud's English rendition of *Seele* (cf. the Jones correspondence and his 1912*g* paper) may be explicable by the fact that the (1912*g*) paper was revised by another hand before its publication (see Strachey's Editorial Note, *SE*, **12**, 257/*RSE*, **12**, 253). Steiner's conclusion is that 'soul' and not 'mind' would have been Freud's preferred choice for *Seele* (Steiner, 1987, 81). This does not imply that 'soul' would necessarily be an appropriate translation for *Seele* today; but Steiner stresses the complexity of the meaning of the word *Seele*, and the resonances which it has in German – resonances which were at that time often captured by the English word 'soul' (Steiner, 1991, 377 *n*.).

Steiner also points out that Bettelheim, who pivots his entire critique of American psychoanalysis on the translation of this term, is wrong to claim that the earlier English translators did not translate *Seele* as 'soul'. Chase, working under Freud's direct supervision, and Brill, too, on occasion, rendered *Seele* and its compounds as the English 'soul' (Steiner, 1987, 77–8, 1991, 354). Riviere, in her translation of Freud's *Introductory Lectures*, used 'soul' many times where Strachey would later put 'mind'. Steiner (1987, 54, 1991, 378) also draws attention to the probable influence that Jones had on the eventual standard translation of the term by Strachey.

Solms & Saling (1990, 29–30), Cheshire & Thomä (1991, 430) and others argue against the suggested alternative translation, 'soul', on the grounds that it has much stronger metaphysical connotations for modern English-speaking readers than *Seele* does for German-speaking readers. Whiteside (2006, xxvii) notes in this regard that the shift from 'soul' to 'mind' was a result of cultural transition over time, and this applies equally to the modern connotations of *Seele* in German. It may be this transition that motivated Strachey to reserve 'soul' for those instances where Freud used

Seele in an undeniably metaphysical sense (see Guttman, 1984, **5**, 634–5). Solms & Saling (1990, 29–30) argue further that 'mind' in the *Oxford English Dictionary* definition (**6**, 461) does, in fact, cover the whole subjective being of a person, not only the cognitive aspect. They also point to a neurological precedent for Strachey's rendition (viz. *Seelenblindheit* and *Seelentaubheit*, which are traditionally translated as 'mind-blindness' and 'mind-deafness' respectively). Freud was very familiar with this usage (see Freud, 1891*b*). 'Mind' was also used frequently in contemporaneous general psychological, anthropological and philosophical literature in English (see, for example, McDougall's *Body and Mind*, 1911, and *The Group Mind*, 1920*a*). In this regard, it is noteworthy that Freud translated 'group mind' as '*Massenseele*' (e.g. *SE*, **18**, 84/*RSE*, **18**, 80).

Account has also to be taken of the fact that Freud speaks of the *Seelenlehre* ('doctrine of the soul') as being synonymous with the wishful phantasy of immortality (see Freud, 1915*i*; *SE*, **14**, 294–5/*RSE*, **14**, 293–4). Brull (1975, 275) agrees that 'soul' has unintended metaphysical connotations, and suggests **spirit** as a compromise term, but this hardly avoids the problem. It should also be remembered that some commentators believe that Freud fully intended his usage of the word *Seele* to include some metaphysical connotations (see Brull, 1975, 275; Ornston, 1992, 64; Laplanche et al., 1992, 177). After all, Freud asserted repeatedly that the *Seele* was unconscious 'in itself', in Kant's sense (see, for example, Freud, 1915*e*; *SE*, **14**, 171/*RSE*, **14**, 151).

Steiner (1991, 377 *n*.), in a thorough discussion of the problem, emphasizes the etymological link between *Seele* and 'soul' and stresses the fact that the English 'soul' – no less than the German *Seele* – has many non-metaphysical meanings, as illustrated by the usage of both terms throughout history in a variety of philosophical and scientific contexts, including in the work of McDougall, 1911, cited above (Steiner, 1987, 77, 78). Steiner (1991, 377) also points out that the *Oxford English Dictionary* treats 'mind' and 'soul' as interchangeable in some respects.

Strachey pointed out in a footnote to the translation of Freud's (1905*b*) paper, 'Psychical (or Mental) Treatment' (*SE*, **7**, 283 *n*. 1/*RSE*, **7**, 241 *n*. 1), that the German term *Seele* is closer to the Greek **psyche** than is the English 'mind', but Bettelheim (1983, 75) insists that by failing to mention that 'the English word for *Seele* is "soul" and not "mind"' the footnote merely distorts Freud's meaning further. However, Strachey did state elsewhere that Freud treated *seelisch* and *psychisch* as precise synonyms, and that his rendition of the terms by the English 'mental' and 'psychical' respectively might create the incorrect impression that they have different meanings in the original (see *SE*, **1**, xix, xxiv/*RSE*, **1**, xx, p. 102 below; cf. Rycroft, 1968, 91). Some modern commentators accordingly suggest that Strachey should have rendered both *Seele* and *Psyche* as 'psyche' (e.g. Ornston, 1992, 66). However, see Laplanche (1991, 404) for a contrary view.

Selbstständigkeit. See *Autonomie*.

Selbsterhaltung. Brull (1975, 277) considers Strachey's translation of this term, **self-preservation**, to be too passive and defensive. According to Brull, Freud used the word in an active way, referring to an ego drive. He therefore suggests that it should have been translated as **upholding of the self**. However, this suggestion would be difficult to follow in practice; could *Selbsterhaltungstrieb* seriously be translated as

'drive to upholding the self'? It should also be remembered that Strachey translated *Selbstgefühl* as 'self-regard', 'self-esteem', 'self-assurance' or 'self-confidence', and that he translated '*Selbstbehauptung*' as 'self-assertion'. Interestingly, though, he sometimes translated the latter term, like *Selbsterhaltung*, as 'self-preservation' (e.g. *SE*, **20**, 265/*RSE*, **20**, 249). Cf. Alix Strachey, 1943, 62.

Sex. See *Geschlecht*.

Struktur, *Träger*. See *Aufbau*.

Trieb. Strachey's translation of this term by the English **instinct** was attacked, as he himself acknowledged in 1966, 'with considerable . . . severity' (*SE*, **1**, xxiv/p. 102 below).

The criticisms of Strachey's translation are diverse. A *Trieb* is a directionless force; an 'instinct' is a specific behavioural tendency (Jones, 1955, 354; Brandt, 1961, 337–8; Holder, 1970, 21, 1988, 213; Pribram & Gill, 1976, 43–4; Bettelheim, 1983, 104; Ornston, 1982, 416; Laplanche, 1997, 54; Whiteside, 2006, xxix). A *Trieb* exerts continuous pressure; an 'instinct' is active discontinuously (Kernberg, 1982, 909). *Trieb* has no qualitative connotations; 'instinct' does or can have (says Brandt, 1961, 338). The vicissitudes of a *Trieb* are modifiable by analysis; an 'instinct' is fixed and immutable (say Brull, 1975, 276, and Bettelheim, 1983, 106). The pressure of a *Trieb* can be consciously felt; an 'instinct' operates automatically and is always unconscious (say Brull, 1975, 276, and Bettelheim, 1983, 76). Bettelheim (1983, 106 ff.) goes so far as to attribute the rejection by many American psychoanalysts of the concept of a 'death drive' (*Todestrieb*) to the problematic translation of the term as 'death instinct'.

Although *Trieb* and 'instinct' have parallel etymological roots (both are derived from words meaning 'to push'; Laplanche, 1976, 9), it is widely argued that, had Freud meant *Trieb* to imply 'instinct', he would have used the equivalent German term *Instinkt*. But, in fact, he clearly distinguished between *Trieb* and *Instinkt* (Holder, 1970, 19 ff., 1988, 213; Brull, 1975, 276; Laplanche 1976, 9, 1991, 403, 1997, 54; Bettelheim, 1983, 104; Ornston, 1982, 416, 1985*a*, 402). Laplanche & Pontalis succinctly define this problem:

> In Freud's work the two terms [*Trieb* and *Instinkt*] are used in quite distinct senses. The Freudian conception of *Trieb* – a pressure that is relatively indeterminate both as regards the behaviour it induces and as regards the satisfying object – differs quite clearly from theories of instinct, whether in their traditional form [of an inherited behaviour pattern peculiar to an animal species, varying little from one member of the species to another and unfolding in accordance with a temporal scheme which is generally resistant to change and apparently geared to a purpose] or in the revised version proposed by modern researchers . . . When Freud does use the word '*Instinkt*' it is in the classical sense: he speaks of *Instinkt* in animals confronted by danger and of the 'instinctive recognition of the dangers' (Freud, 1926*d*, 168 [*RSE*, **20**, 148]), etc. Moreover, when Freud asks whether 'inherited mental formations exist in the human being – something analogous to instinct (*Instinkt*) in animals' (1915*e*, 195 [*RSE*, **14**, 172]), he does not look for such a counterpart in what he calls *Triebe*, but

> instead in that 'hereditary, phylogenetically acquired factor in mental life' (1918*b*, 120–1 [*RSE*, **17**, 108]) constituted by *primal phantasies* (primal scene, castration) . . . There is consequently a risk that the Freudian theory of instincts [*Triebe*] may be confused with psychological conceptions of animal instinct, and the unique aspects of Freud's approach may be blurred, particularly the thesis of the relatively undetermined nature of the motive force in question, and the notions of contingence of object and variability of aim. (Laplanche & Pontalis, 1973, 214–15.)

Strachey (*SE*, **1**, xxiv–xxvi/pp. 102–3 below) was well aware of the distinction between the German terms *Instinkt* and *Trieb* (although he noted one occasion where Freud appeared to use *Instinkt* as a complete synonym for *Trieb*, viz. in a letter to Fliess dated October 15, 1897). Holder (1970, 22) draws attention to another: in Freud's (1921*c*) essay on 'Group Psychology' he used the terms *Herdeninstinkt* and *Herdentrieb* interchangeably (*SE*, **18**, 118/*RSE*, **18**, 110). (See also Rycroft, 1968, 38.) The same interchangeability can be seen in his translation of Havelock Ellis and Frazer in *Totem and Taboo* (1912–13*a*; see, e.g., *RSE*, **13**, 114 *n*. 2, 115 *n*. 1). Also, Freud's definitions of *Trieb* in *Beyond the Pleasure Principle*, Part V, certainly include inherited behaviour patterns peculiar to an animal species (*SE*, **18**, 57/*RSE*, **18**, 54 f.). To avoid confusion, Strachey resolved to annotate all instances in his translation where the English word 'instinct' denoted *Instinkt* rather than *Trieb* in the original German (a resolution which, in fact, he did not remotely fulfil – e.g. *SE*, **14**, 292/*RSE*, **14**, 291; cf. Solms, 1993, 21 *n*. 26; see Holder, 1970, 19–22). Strachey's many oversights in this respect have been corrected in the *RSE*.

In the earliest Freud translations – perhaps following Havelock Ellis (1903) – Chase, Brill and Jones all translated *Trieb* as **impulse**, seldom as 'instinct' (Steiner, 1987, 78, 1991, 367). This, together with '**tendency**', is the translation given in Lehfeldt's *Medizinisches Taschenwörterbuch* (1900), of which Jones possessed a copy (now in the Library of the Institute of Psychoanalysis, London). In her (unpublished) corrections of page proofs for the *Standard Edition*, Anna Freud suggested **urge** as an alternative to Strachey's 'instinct' in a number of specific places (but there is no record of her having objected to the latter term in general). Ernest Jones, too, was surprisingly unhappy with 'instinct':

> The Germans have a beautifully non-committal word *Trieb*, which the Americans have translated by the useful term 'drive'. It applies to any driving force whether innate or acquired, and it can even be used, as Freud did in the phrase *Todestrieb*, to designate a general tendency immanent in all nature. Neither of these meanings has a specific biological connotation, as the English word 'instinct' has, and therefore it is misleading to translate the word *Todestrieb* by the expression 'death instinct' or *Aggressionstrieb* by 'aggressive instinct'. (Jones, 1946, 11.)

Strachey was, however, not the first to render *Trieb* as 'instinct'; Sachs (1885), for example, translated Meynert's usage of *Trieb* as 'instinct', as did Robertson & Rutherford (1892) when translating Griesinger (1862), and De Leon (1904) translated Bebel's *Geschlechtstrieb* as the 'sexual instinct' (*RSE*, **3**, 145). This reflects the fact that

the clear distinction between the terms *Trieb* and *Instinkt* that Laplanche & Pontalis (1973) referred to was less clear at the beginning of the twentieth century than it is today. Strachey was also not the last to translate *Trieb* as 'instinct'; as recently as 1974, for example, McGrath (1974) did so in his quotations from Mahler and Lipiner (1913). See Vermorel (1990) who provides a comprehensive discussion of the historical and cultural context of this term. The scientific meaning of 'drive' is also constantly evolving (see Pfaff, 1999). Currently it appears to imply narrower forms of homeostatic regulation of the bodily economy than Freud, perhaps, intended in his usage of *Trieb* (Panksepp, 1998). Solms (2021) even suggests that instincts are inborn *responses* to drives, responses which need to be supplemented by learning.

Nevertheless, the nearly unanimous opinion in modern psychoanalysis is that 'instinct' should be reserved for *Instinkt*, and that *Trieb* should be translated as **drive** (e.g. Lacan, 1960, 301; Brandt, 1961, 337; Brull, 1975, 276; Pribram & Gill, 1976, 43; Bettelheim, 1983, 104; Ornston, 1982, 416; Laplanche & Pontalis, 1997, 64; Bance, 2002, xxix; Huish, 2002, xxx; McLintock, 2002, xxvi; Webber, 2002, xxvi; Whiteside, 2005, xxxiii, 2006, xxix). The hybrid term '**instinctual drive**' was used for a time by some influential authors (e.g. Hartmann, 1948; Schur, 1966*b*) but 'drive' is now widely accepted in the English-speaking psychoanalytic world (see Hoffer, 1989, 209; although some authors still recommend 'instinctual drive', e.g. Moore & Fine, 1990, 100). It is of interest in this regard that Freud himself, on at least one occasion, used 'drive' for *Trieb* when writing in English (letter to Jones dated March 15, 1935; Paskauskas, 1993, 741), as indeed he used '*Instinkt*' for 'instinct' when translating from English (Freud, 1920*b*; *SE*, **18**, 264/*RSE*, **18**, 254).

For all of these reasons, and especially because 'drive' is now widely accepted as a technical term in Anglo-American psychoanalysis, 'instinct' is reserved for *Instinkt* in the *RSE* and *Trieb* is translated as 'drive'. Also changed throughout the *RSE*, with a few necessary exceptions, is Strachey's choice of 'motive force' for *Triebkraft*, which is now translated as 'driving force'. (See *Motiv* above.)

Why did Strachey not use 'drive'? In his 'Notes on Some Technical Terms Whose Translation Calls for Comment' (reprinted below, pp. 102–3), he offered three reasons, all of which have been questioned.

Firstly he argued that 'drive', used in this sense, is not an English word (see also Jones, 1955, 317). Freud, incidentally, appears to have been aware of this problem; he described *Triebe* (an ancient Gothic word) as a term 'for which we are envied by many modern languages' (1926*e*; *SE*, **20**, 200/*RSE*, **20**, 178). Bettelheim (1983, 104) retorts that this line of reasoning is not very convincing when coming from translators who have created such terms as 'parapraxis' and 'scopophilia'. Bettelheim adds that 'drive' has since become standard American usage, and is defined in this sense, as a 'basic biological impulse or urge', in *Webster's* dictionary. Whiteside (2006, xxix) makes a similar point. However, this overlooks Strachey's further remark that 'it would, however, be absurd to reject the word ['drive'] on that account, if its introduction promised to result in substantial gains' (*SE*, **1**, xxv/p. 102 below).

This leads to Strachey's second objection: Freud used the word *Trieb* to cover a variety of different concepts. According to Strachey, 'the only rational thing to do in such a case seems to me to be to choose an obviously vague and indeterminate [English] word and stick to it. Hence my choice of "instinct"' (ibid.). Evidently Strachey felt that 'instinct' was as vague and indeterminate as Freud's usage of *Trieb* was, and

he hoped that both terms would acquire a special meaning within psychoanalysis. To this, Grubrich-Simitis (1995) replies that, whatever the merits of Strachey's view may once have been, subsequent developments in ethology and neurobiology have rendered 'instinct' anything but vague and indeterminate (e.g. Tinbergen, 1951). Indeed, even by the time of publication of the original *SE*, Strachey recognized that 'the word "instinct" is . . . not used here in the sense which seems at the moment to be the most current among biologists' (*SE*, **14**, 111).

Thirdly, Strachey cited the impossibility of finding an adjectival form for 'drive': 'how do the critics propose to translate "*Triebregung*"?' he asks. The same could be said for *triebhaft* ('instinctual', 'instinctive'), *triebhafter Charakter* ('instinctual character') and *Triebziel* ('instinctual aim'), and many other examples. Bettelheim responds by reviving the old term abandoned by Strachey – 'impulse' – the adjectival form of which is 'impulsive'. However, 'impulse' creates other difficulties for the translator – the rendition of *Regung* and *Impuls*, for example. Ornston (1982, 414) answers Strachey's question concerning *Triebregung* by suggesting **stirring of a drive** (see also Holder, 1988, 213). He feels that Strachey's translation – '**instinctual impulse**' – denotes a more specialized activity than Freud intended. Ornston's reading is supported by Laplanche & Pontalis's (1973, 222–3) distinction between *Trieb* and *Triebregung*, and by their view that Freud always used *–regung* in compound terms (e.g. *Triebregung*, *Wunschregung*, *Affektregung*) to imply the same thing, namely, some form of internal '**setting in motion**'. Laplanche & Pontalis (1997, 64) recommend '**drive impulse**' and '**movement of the drive**' for *Triebregung*. The penultimate alternative is the one adopted in the *RSE*. (See also *Regung* above.) A startling illustration of the difficulty created by *Triebregung* and *Triebhaft* is provided by the fact that Huish (2002) translates them as '**involuntary**'.

Two final criticisms of Strachey's translation of *Trieb* relate to his rendition of its cognates *Partialtrieb* and *Triebentmischung* as '**component** instinct' and 'instinctual **fusion**' (and 'defusion') respectively. Reddick (2003, 250 *n*. 40) sees no good reason to depart from '**partial** drive', on the model of 'partial fraction'; and he (ibid., 259 *n*. 46) prefers 'drive **mergence**' (and 'de-mergence') over 'drive fusion' and 'defusion'.

Triebentmischung, *Triebregung*. See *Trieb*.

Triebkraft. See *Motiv* and *Trieb*.

Überbau. See *Aufbau*.

Überdeterminierung. This term, which is translated as '**over-determination**' in the *Standard Edition*, refers to the multiple determinants of mental formations (Laplanche & Pontalis, 1973, 292). The term was perhaps derived from geometry, where two intersecting lines determine a point, and three intersecting lines overdetermine a point. Underwood (2006, 318 *n*. 4) argues that Freud means simply 'springing from a number of factors'. Moore & Fine (1990, 123) similarly criticize the standard psychoanalytic translation on the grounds that 'the term implies several lines [of determination] but does not always imply more than necessary; so that **multideterminism** is preferable to overdetermination'. This recommendation overlooks the fact that Freud, in his early writings, sometimes used the word

Mehrfachdeterminierung – which Strachey duly translated as 'multiple determination', and which Laplanche & Pontalis (1997, 40) translate as 'multideterminism' (cf. Laplanche & Pontalis, 1973, 292).

Überich, *Über-Ich*. See *Ich*.

Übersetzung. Mahony (1980, 465) points out that Strachey translated this word – which literally means **translation** – inconsistently. For example, he used **transpositions** in *SE*, **1**, 284/*RSE*, **1**, 310; **convey** in *SE*, **5**, 610/*RSE*, **5**, 545; and **explanation** in *SE*, **10**, 186/*RSE*, **10**, 143. (See also Ornston, 1992, 14; Mahony, 1996, 111 *n*. 6.) Mahony (1994*b*) is of the opinion that *Übersetzung* was one of Freud's central technical terms. He notes, for example, that Freud defined repression as 'a failure of translation' (*SE*, **1**, 235/*RSE*, **1**, 262). Likewise, Freud (1940*b* [1938]) wrote at the very end of his life: 'our scientific work in psychology will consist in translating unconscious processes into conscious ones' (*SE*, **23**, 286/*RSE*, **23**, 268). Accordingly, Laplanche (1992, 211) argues that 'it's a series of translations which constitutes the psychic apparatus' and he describes the unconscious as 'the to-be-translated' (Laplanche, 1989, 175). Solms (1999) and Steiner (2021) express similar views. Mahony (1994*b*) suggests that Freud's significant contribution to the theory of translation is obscured by Strachey's failure to translate *Übersetzung* consistently, and as a technical term. However, Steiner (2021) points out that Freud himself – especially in *The Interpretation of Dreams* – used *Übersetzung* in this broader sense more or less synonymously with *Umsetzung*, *Umwandlung* and *Verwandlung*, and (in some places) *Umformung* and *Umwertung*, and even *Übertragung*. As a rule, in this context, Strachey translated the latter terms as **transformation**. Steiner (2021) makes the telling point that translation, no less than transference, entails transformation; meaning cannot be transferred mechanically from one language/form into another. Jung (1935) was perhaps the first to draw attention to the significant theoretical link between *Übersetzung* and *Übertragung*.

Übertragung. Ornston (1982, 416, 1985*a*, 392, 1992, 7 *n*. 5, 10, 172 *n*. 61) is of the opinion that this noun, which Strachey almost always translated as **transference**, should have been treated more sensitively. According to Ornston (1982, 417), Freud's usage of *Übertragung* (and *übertragen*, etc.) often reflects a less concretely 'spatial' notion than is suggested by the English word 'transference' (and 'transfer', etc.). Ornston's charge is that the range of Freud's possible meanings is lost in Strachey's uniform rendition. Laplanche (1991, 402–3) and Mahony (1996, 13, 31) argue for the very opposite approach: since *Übertragung* is such a central concept it should be translated consistently, despite variations in Freud's usage (echoing Mahony's argument regarding *Übersetzung*). The variations in Freud's usage of the term are discussed in some detail by Laplanche & Pontalis (1973, 455 ff.) and Laplanche et al. (1992, 172).

Steiner (1987, 69, 78, 1991, 357) traces some of the precedents for Strachey's translation. It should be noted that Strachey made no attempt to standardize his translation of this word when it is used in a non-technical sense (see the two examples in 1896*c*; *SE*, **3**, 209, 216/*RSE*, **3**, 215, 221). It is also noteworthy that Freud himself used the English word 'transference', in the sense of *Übertragung*, in his (1926*f*) *Encyclopaedia Britannica* article.

Ungeschehenmachen. This is a colloquialism which, as Brandt (1961, 336) points out, evokes memories of early childhood, when it seemed possible 'to make something **unhappen**' – to use a literal translation of the German. Brandt (1961, 336) points out that the German word *Ungeschehenmachen* refers to something impossible, and conveys feelings of shame, regret, and possibly even hopelessness. It also implies a reparative wish.

The standard English translation in psychoanalysis is **undoing**, which does not carry all of these connotations. There is therefore a conceptual loss in the translation. Furthermore, as Brandt says, the childishness of the implicit wish and the impossibility of its fulfilment in external reality are also lost in this translation. Hoffer (1989, 210) draws attention to the magical reversal of time that is inherent in the original German word, and the denial of reality. He argues that Strachey's rendering, though not strictly inaccurate, therefore fails to convey the gravity of the clinical phenomenon it denotes. This argument is weakened somewhat by the fact that Laplanche & Pontalis (1973, 478) make the same point about Freud's concept itself (in any language). Although Hoffer, like Brandt, translates *Ungeschehenmachen* literally as 'making unhappen', he concedes that no serviceable English word (**annul** for example) fully conveys Freud's meaning. This certainly applies also to Reddick's **obliterate** (2003, 267 *n*. 32).

Strachey does explain at one point (*SE*, **20**, 119 *n*. 1/*RSE*, **20**, 106 *n*. 1) that *Ungeschehenmachen* means literally **making unhappened**.

Unlust. See *Lust*.

Verdichtung. Steiner (1988*c*, *passim*) and Ornston (1992, 12–13) discuss some of the rich connotations of the term *Verdichtung* in German science and culture. Steiner (1987, 77) argues that Strachey's standard translation of the term, **condensation**, reduces it to only one of the possible meanings encompassed by the original German term, namely 'a physico-chemical denotation connected with the idea of vapour condensation' (ibid.). According to Steiner, this translation loses the phonetic link between *Verdichtung* and *Dichtung* (poetry) and thereby disconnects the term from, for example, Freud's romantic sources on the subject of dreams (Steiner, 1987, 77, 1988*c*, *passim*). Ornston (1992, 13), presumably for the same reasons, recommends **poetically composed** as an alternative translation of Freud's term. Following a similar line of thought, Roman Jakobson compares Freud's concepts of condensation and displacement to metaphor and metonymy. However, it is important to recognize, as Pigman (1994, 20) points out, that *Dichtung* and *Verdichtung* have quite different etymological roots. Pigman endorses Strachey's translation of *Verdichtung* as 'condensation'. Grubrich-Simitis (1995) makes the same point. She stresses that **compression** is the essential denotation of *Verdichtung* (see Editors' footnote in *RSE*, **5**, 303 *n*. 1, where Freud uses *Kompression* as a complete synonym for *Verdichtung*). This is how Underwood (2006) translates it, pointing out that Freud's *Verdichtung* is a process of 'making denser' or '**concentration**'. Laplanche & Pontalis (1997, 60), like Grubrich-Simitis, accept 'condensation'.

Verdrängung. Both Brandt (1961, 335) and Bettelheim (1983, 93 ff.) have criticized the well-established English translation of this important term: **repression**.

Brandt (1961, 335–6) objects only to the (downward) directional connotations of the English word, which are not present in the original German. Brandt feels that this distinction is important from a metapsychological point of view: 'Freud indicated no direction [by the concept] . . . its essence lies only in . . . dismissal and keeping at a distance from consciousness' (ibid., 336). Ornston (1982, 422) draws attention to this implication of the German term by reminding us that it had its origins in Herbart's quasi-mathematical model of conflicting psychical intensities.

Bettelheim (1983, 93 ff.) makes similar critical remarks, pointing out that the meaning of the English word 'repression' is closer to the German *Unterdrückung* than *Verdrängung*. Further, he objects to the fact that 'repression', like *Unterdrückung*, refers in ordinary usage to an interpersonal or other external process rather than to an intrapsychic one. He also draws attention to the inner urgency implied by the *Drang* in *Verdrängung*. Correct translations of the noun *Verdrängung* and the verb *verdrängen*, Bettelheim argues, would be **repulsion** and **to repulse**. He points out that *Webster's* dictionary defines the latter term (which Freud [1912g] apparently used for 'defence' when writing in English) as 'to drive or beat back, to repel or ward off, to force back; to repel with denial; to reject, refuse, shut out' – all actions and motivations that are implied by *Verdrängung* (Bettelheim, 1983, 94).

Both Brandt and Bettelheim were apparently unaware that it was Freud himself, in 1908, who first proposed 'repression' to translate his term into English (Jones, 1959, 169; Steiner, 1987, 57; cf. Paskauskas, 1993, 385). Steiner (1987, 58) points out that Freud might have had in mind the way in which the term had already been used in America at the turn of the century, by Page (1893) and Havelock Ellis (1903), for example. Be that as it may, Freud's proposal was immediately accepted and used forthwith by Chase and Jones and others. Freud accordingly seems to have used 'repressed' when writing in English (see Freud, 1912g) and he certainly used 'repression' in his *Encyclopaedia Britannica* article (1926f). Brill, however, appears to have arrived at the term 'repression' independently of Freud. He initially considered translating it as **suppression** (see Steiner, 1987, 82). Steiner (ibid., 58 and *n*. 32) anticipates the objection that Freud's knowledge of English was not that of a native speaker, by quoting Jones's and Riviere's assurances to the contrary. Freud's sensitivity to nuances of English translation is also attested to by Grubrich-Simitis (1993, 34 f. *n*. 1; trans., 20 *n*. 7).

Interestingly, 'repression' is, at root, a Latinism, as are many of Freud's scientific terms in the original German (Steiner, 1987, 58; Wilson, 1987, 304). This applies even to the word *Psychoanalyse*. Cf. the widespread criticism of Latin renditions of Freud's terms in the English translation.

As Reddick (2003, 246 *n*. 9) points out, further problems arise with '*das Verdrängte*', which Strachey translated as '**the repressed**'. Substantivized past particles in English tend to refer to people, not to things or abstractions. Reddick therefore avoids 'the repressed' on the grounds that it would not be readily comprehensible to non-specialist readers; he opts instead for phrases such as '**the repressed element**'.

Vergessen. This ordinary German word (as an abstract noun) means **forgetting** and is only considered a technical term insofar as it denotes a form of parapraxis. See the entry below for a comment on the prefix *Ver–*, which binds the German terms for

'misreading', 'mishearing', 'mislaying', etc. **Misremembering** is, of course, not the same thing as forgetting, so the alliterative link is lost in translation.

Vergreifen. Bettelheim (1983, 85–6) feels that **bungled actions**, which was Strachey's translation of this term (as an abstract noun), is wrong on many levels. It is wrong, he argues, firstly, because the action is not 'bungled'; 'on the contrary, it is often very clever in giving physical expression to unconscious thoughts, needs or desires' (ibid., 86; cf. *Fehlleistung* above). Secondly, according to Bettelheim, it is wrong because it gives the impression that the action was intended but clumsily executed, when no action whatsoever was intended in many instances. Thirdly, 'it obstructs the connotations of abuse that are inherent in both *Vergreifen* and the English word "mishandling"'.

The latter term (**mishandling**) is Bettelheim's preferred alternative translation of *Vergreifen*. He points out that the prefix in this rendition (mis–) has the advantage of accommodating the way Freud bound together *Vergessen*, *Versprechen*, *Vergreifen*, etc. Strachey did, in fact, draw attention to this common prefix, and to its equivalence with the English 'mis–' (*SE*, **6**, 240 *n*. 1/*RSE*, **6**, 206 *n*. 2; *SE*, **15**, 26 *n*. 1/*RSE*, **15**, 24 *n*. 1). Moreover, he did translate most of those German terms which lend themselves to such a rendition with this prefix: e.g. 'misreading' for *Verlesen*, 'mishearing' for *Verhören* and 'mislaying' for *Verlegen*. Cf. the problem with 'misremembering', discussed above.

Bell (2002) considered various alternatives and finally settled for '**inadvertent actions**'. This choice would certainly not have satisfied Bettelheim.

verlaufen. This term, in Freud's technical usage, does not refer to a form of parapraxis. See *abfliessen*.

Verleugnung. Freud used this technical term in two slightly different senses (see *SE*, **21**, 153 *n*. 4/*RSE*, **21**, 138 *n*. 5). Despite Strachey's appeal (*SE*, **19**, 143 *n*. 1, 235 *n*. 1/*RSE*, **19**, 133 *n*. 1, 238 *n*. 1) for it to be translated by the English word **disavowal** rather than **denial**, the latter term is still widely used today (e.g. Rycroft, 1968, 29; Moore & Fine, 1990, 50, 57; Laplanche & Pontalis, 1997, 62, 64; see Litowitz, 1998, 129, for further examples). Laplanche & Pontalis (1973, 120) argue that the connotations of 'denial' (*déni* in French) come closest to Freud's usage of *Verleugnung*. Strachey himself, too, frequently translated it as 'denial' (e.g. *SE*, **14**, 221/*RSE*, **14**, 196), at least in the chronological series of works preceding Freud (1923*e*), at which point he makes the above appeal and remarks: 'From now on, the concept of "disavowal" comes to occupy a more and more important place in Freud's writings' (*SE*, **19**, 143 *n*. 1/*RSE*, **19**, 133 *n*. 1). The possible implication is that Strachey's appeal for 'disavowal' applied only to Freud's usage of '*Verleugnung*' after 1923. This view is perhaps supported by the fact that Strachey (ibid.) explained that he thought it better to choose 'disavowal' in order to avoid confusion with the German '*Verneinung*', which Strachey translated as 'negation' from that point onwards. Until Freud's (1925*h*) paper on 'Negation', Strachey had habitually translated the latter term, too, as 'denial' (see *SE*, **19**, 235 *n*. 2/*RSE*, **19**, 238 *n*. 1).

Versagung. Strachey usually translated this term, when used in connection with the onset of neurosis, by the English **frustration** (and at other times, depending upon the context, as **refusal**, **renunciation**, **deficiency** or **failure**; see Strachey, *SE*, **9**, 188 *n*. 1/ *RSE*, **9**, 164 *n*. 2). Reddick (2003, 243 *n*. 23), who accuses Strachey of 'routinely and astonishingly' mistranslating the term as 'frustration', is evidently unaware of this variability; he argues vehemently for 'refusal'. Brandt (1961, 337) objects to both 'frustration' and 'refusal' on the grounds that the German term refers only to a failure of something to occur; no external agent is required. The corresponding German verb *versagen* cannot have a person as a direct object; it can only be used impersonally, in the sense of 'something is denied me'. In Freud's usage, the term refers mostly to someone reflexively denying something to themselves – that is, depriving themselves of it (Brandt, 1961, 337; cf. Laplanche & Pontalis, 1973, 175). Brandt (1961, 337) argues that 'the English word conveys the feeling that something is done to somebody, while the German word implies that something is not done that should have been done'. Huish (2002, xxxii) points out that Freud's usage has to be understood in intrapsychic terms; one mental agency can refuse to oblige another. All of this could equally well be said of parapraxes – 'failures' of memory, speech, writing, and so on (cf. *Vergessen*, *Versprechen*, *Verschreiben*, *Verlegen*, etc.) – which are, in a sense, all varieties of *Versagen*.

Laplanche & Pontalis (1973, 175–6) – in a full discussion of the concept – point out that, strictly speaking, only the self-preservative drives can ever be said to be 'frustrated', since the sexual drives can generally be satisfied auto-erotically or in phantasy (and through sublimation).

Brandt appears to suggest that **denial** would have been a better translation, but, given the history of this English term (see *Verleugnung* above), the suggestion involves complications of its own. **Privation** might convey something of the meaning of the original concept. The implications of these nuances are of obvious importance for psychoanalysis. However, Laplanche & Pontalis (1973, 176 *n*.) conclude: 'Given the generality of its use and the difficulty of finding an equivalent which would apply in all cases irrespective of context, we feel that "frustration" remains the best rendering of "*Versagung*".' (See also Laplanche & Pontalis, 1997, 68.)

Verschiebung. Steiner (1987, 77) argues that the standard English translation of this term, **displacement**, does not render the full meaning of the German word. *Verschiebung* means, literally, **shifting**, and thus conveys a sense of the perennial mobility of the unconscious processes; whereas 'displacement', with its notion of spatial dislodgement, gives the idea of something more rigid and focused. The German word does not contain the notion of a place of origin (Steiner, 1988*c*, 449). As Mahony (1996, 46) points out, 'displacement' implies that there was a right place to start with, whereas 'shifting' carries no such implication. However, Mahony acknowledges that *Verschiebung*, in Freud's usage, does sometimes have the former implication.

Steiner (1987, 1988*a*, 1988*c*, 1991) traces the historical precedents for Strachey's rendition, but notes also that Hubbard Judd, in his 1902 translation of Wundt (1897), rendered *Verschiebung* as 'shifting' (ibid., 336).

Ornston (1992, 12) points out that the German term has connotations of underhanded exchange, and draws attention to the fact that *Verschiebung* can mean

postponement or **delay**. According to Ornston, the latter connotations of the German word have metapsychological implications not conveyed by the word 'displacement'. However, Strachey did sometimes vary his translation of the term to indicate temporal delay (Ornston, 1992, 12); and Ornston's claim that *Verschiebung* has connotations of **smuggling** [*Schiebung*] is erroneous (Grubrich-Simitis, 1995).

It is of interest to note that Alix Strachey suggested to James (in unpublished corrections of page proofs for the *Standard Edition*) that he should have used the term 'displacement' rather than 'shifting' in a number of places in the opening sections of *Jokes and their Relation to the Unconscious* (*SE*, **8**, 50, 51, 55/*RSE*, **8**, 44, 45, 48), as it would give readers time to get used to the notion of 'displacement jokes' (which occurs for the first time on ibid., 55/48 f.).

Versprechen. Although Bettelheim (1983, 84–5) considers Strachey's translation of this abstract noun (**slip of the tongue**) to be acceptable, he believes that the frequency with which people use the expression 'a Freudian slip' – rather than saying 'a slip of the tongue' or 'a Freudian slip of the tongue' – is indicative of the problematic status of the standard translation. Hoffer (1989, 209) implies the very opposite, but he conflates *Versprechen* with *Fehlleistung*.

Whether Bettelheim's observation is valid or not, he feels that Strachey's translation creates the unfortunate impression that the tongue itself is responsible for the error. He suggests that **lapse** would have been a better rendition, and points out that Freud used the Latin *lapsus* in some of his original examples. This alternative translation would have the additional advantage, according to Bettelheim, of evoking associations to the word's meaning as 'a falling away from a higher standard' (1983, 84).

Vorstellung, *Wortvorstellung*, *Sachvorstellung*, *Dingvorstellung*, *Objektvorstellung*. Strachey usually translated *Vorstellung* as **idea**, but he also used **presentation** and **image** in some contexts. *Wort-*, *Sach-*/*Ding-* and *Objektvorstellung*, on the other hand, were consistently translated as word, thing and object presentation respectively.

The variety of terms used by Strachey illustrates the difficulties inherent in the translation of *Vorstellung* (see Villarreal, 1992, 122–3). Nowhere are the difficulties more apparent than in 'The Unconscious' (Freud, 1915*e*). In the first six sections of that paper, Strachey translated *Vorstellung* as 'idea'. On p. 174 *n*. 1 of *SE*, **14** (*RSE*, **14**, 154 *n*. 2), he annotated the word with the comment that the original German covers the English 'idea', 'image' and 'presentation'. Then, in the seventh section, he was forced to switch from 'idea' to 'presentation' for the remainder of the paper and to provide a brief commentary on the translation of the term in a footnote (ibid., 201 *n*. 1/177 *n*. 1). Finally, in an Appendix to the paper, he continued to translate *Vorstellung* as 'presentation', but now remarked that 'image' was equivalent to *Bild*.

In more recent times, the term **representation** has been added to the existing array (Rycroft, 1968, 101, 141, 178; Sandler, 1985, 13; Herrera, 2010, 793). Steiner (1984) notes that Strachey, in a working copy of the fourth volume of Freud's *Collected Papers*, referred to J. S. Mills's rendition of Kant's *Vorstellungen* as 'representations'. However, the distinction between *Vorstellung* and *Darstellung* (depiction and portrayal) must also be taken into account here. In the *Standard Edition*, the latter term was

typically translated as 'representation' (cf. Alix Strachey, 1943, 15). This translation of *Vorstellung* is also complicated by the fact that Freud sometimes used the terms *Vorstellungsrepräsentanz* (or *Vorstellungsrepräsentant*), which Strachey translated as 'ideational representative'. Herrera (2010) applauds this rendition (but see below). Similar, less problematic considerations apply to *psychische Repräsentanz* and *Triebrepräsentanz* (see also Ricoeur, 1970, 116 *n.* 2). Further difficulties are introduced by the fact that Freud, especially in his earlier neurological writings, sometimes used the German term *Repräsentation* (e.g. 1891*b*, 51). Moreover, he used that term to refer to a higher, indirect mode of psychical registration of external reality, which he distinguished from a lower, direct mode, designated by the term *Projektion* (or *vertreten*). The distinction between these two terms (*Repräsentation* and *Projektion* and the two modes of registering reality that correspond to them) is somewhat analogous to the distinction between the terms 'perception' (or 'apperception') on the one hand and 'sensation' on the other. The distinction between *Vorstellung* and *Repräsentation* in Freud's writing thus appears to coincide with the distinction between mnemic and perceptual presentations of reality. Accordingly, Laplanche & Pontalis (1973, 200) argue that Freud's usage of the term *Vorstellung* refers to 'that which is inscribed of the object in the mnemic systems' and not so much to the 'subjective presenting of an object'. See also Villarreal (1992, 122).

Herrera (2010, 793) comes to the same conclusion, and provides a lucid discussion of the origin of the term 'idea' in the writings of Hume. According to Herrera, when Strachey renders *Vorstellung* as 'idea', he is merely resorting to the original English philosophical term which *Vorstellung* translates into German, namely 'the internal image of an object which we can evoke in our mind when the object is absent' (ibid., 791). However, Herrera points out that 'idea' – with the philosophical and psychological meaning of 'mental image' – vanished from academic discourse in the twentieth century and was replaced by '**mental representation**'. Herrera favours this latter translation, together with a warning to readers that this term is being used in the sense of 'mental image'. (He agrees that 'image' alone is best reserved for the German *Bild*.) Herrera also points out that 'presentation' does not correspond to Hume's notion of an 'idea' but rather to Locke's notion – to the content of any conscious mental activity. Since this clearly differs from Freud's usage of *Vorstellung*, Herrera argues that 'presentation' is the wrong translation for this term. For Freud (according to Herrera) a *Vorstellung* always arises from a memory trace, never directly from external sensory stimuli. What this overlooks, however, is the problem of reality-testing: the determining factor as to whether a conscious image arises from external or internal sources is not intrinsic to the image. Thus, for example, Freud writes:

> We must recollect that all presentations [*Vorstellungen*] originate from perceptions and are repetitions of them. Thus originally the mere existence of a presentation [*Vorstellung*] was a guarantee of the reality of what was presented [*des Vorgestellten*]. (1925*h*; *SE*, **19**, 237/*RSE*, **19**, 239.)

It is unclear how Herrera would translate such a passage.

Rizzuto (1990, 243) draws attention also to the usage of *Vorstellung* in the writings of Leibniz and Kant. She insists that, for Freud, a *Vorstellung*, unlike an *Idee*, always

had sensorial qualities – a *Vorstellung* is a mental event prompted initially by the sensorial perception of a thing. A *Vorstellung*, she argues, only makes sense in opposition to a Kantian *Ding an sich* ('thing in itself'). On these grounds, however, she too suggests that the best translation of the term is 'representation'.

Steiner (1987, 67, 73) traces the history of the psychoanalytic translation of *Vorstellung* in some detail. It was first translated by Michell Clarke, in 1896, as both 'idea' and 'representation'. Chase, working under Freud's supervision, used 'idea'. Brill (1909) used 'idea' (and occasionally 'presentation') when translating Jung, but he used only 'presentation' when translating Freud. In the latter case, he reserved 'idea' for the German *Idee*. Steiner (1991, 357) points out that, in doing so, despite the ambiguity and awkwardness of his translation, Brill was attempting to draw attention to a distinction which certainly exists in the original German, namely, that between *Vorstellung* and *Idee*. This distinction was not consistently reflected in Strachey's translation (see Steiner, 1987, 73 *n*. 59). Jones, like Strachey, used 'idea' for both *Vorstellung* and *Idee*. However, Jones and Strachey continued to be preoccupied by the problem of the proper translation of this word, as is reflected in a letter from Strachey to Jones dated May 23, 1954, cited by Steiner (1987, 67 *n*. 46). In this context, it is of interest to note that Anna Freud complained to Strachey that she found his translation of Freud's essay on 'Negation' difficult to read, adding, 'Is it perhaps the use of the term "presentation" for *Vorstellung*?' (undated corrections to page proofs).

Freud himself, when writing in French, translated *Vorstellung* both as *idée* and *conception* and appears to have treated them as synonyms (see Freud, 1893*c*; *SE*, **1**, 170 *n*. 1/*RSE*, **1**, 197 *n*. 1). When writing in English, however, he seems to have considered **conception** to be the equivalent term for *Vorstellung*, and 'idea' as being equivalent not only to *Idee* but also to *Gedanke* (usually translated as 'thought' in the *Standard Edition*), and even to *Vorstellung* in one place (see Freud, 1912*g*; Editors' Note, *SE*, **12**, 257–8/*RSE*, **12**, 253–4). Ornston (1985*a*) is of the opinion that Freud was here drawing a distinction between active mental elements ('conceptions') and passive ones ('ideas'). He does not present evidence in support of this opinion. It must also be remembered that Freud's (1912*g*) English text was 'lightly corrected' by another hand. Strachey, too, translated *Vorstellung* as 'conception' in some instances (see Villarreal, 1992, 123). However, Ricoeur (1982) argues that *Vorstellung* is to be understood as the opposite of *Begriff* ('concept') and suggests that it should be translated as **figurative thinking**. On this view, 'conception' would clearly be an inadequate translation. Steiner (1991, 357), too, emphasizes the fact that Freud used *Vorstellung* when he was referring to the subjective 'presence' of images or thoughts. It should be noted that in nineteenth-century neurology an important theoretical distinction was drawn between *Sprachvorstellungen* or *Sprachbilder* (sensory and motor memory 'images' for words) and their corresponding *Begriffen* (semantic 'concepts'), and Freud (1891*b*) was very well aware of this.

Steiner (1991, 357) reminds us that Freud derived his usage of *Vorstellung* – with its profound philosophical implications in German culture – from the tradition of Herbart, Strümpell, Wundt and Lipps (as well as Schopenhauer). He questions whether Freud's translators all understood the same thing by *Vorstellung*, and refers interested readers to Wundt's (1874) history of the term (Steiner, 1987, 67 *n*. 47). See also Ward's celebrated article on 'Psychology' in the *Encyclopaedia Britannica* (Steiner, 1991, 357 *n*. 15). However, Frankland (2005, xxiv) argues for uniformly

translating *Vorstellung* as 'idea' – the term with the widest common currency – on the grounds that Freud was deeply suspicious of academic philosophy! Reddick (2003, 254 *n*. 4) similarly ignores the philosophical context and suggests that a *Vorstellung* is a **notion**.

Still more problems are introduced by Freud's compounds: *Wortvorstellung*, *Sachvorstellung*, *Dingvorstellung*, *Objektvorstellung*. Firstly, the very existence of the term *Wortvorstellung* (for verbal symbols), which Freud contrasts with the latter three synonymous terms (for the things that words symbolize), would appear superficially to contradict the view that *Vorstellung* refers only to a concrete figurative presentation or to an image derived directly from external sensory impressions (Ricoeur, 1982; Rizzuto, 1990; see above). Accordingly, Reddick (2003) uses 'thing-notion', 'word-notion', etc., and complains that Strachey's 'word-presentation' is 'a particularly bizarre and misleading concoction' (ibid., 256 *n*. 17). However, Freud's earliest writings on the subject (e.g. 1891*b*, 1950*a* [1895]) make plain that symbolic *Wortvorstellungen* are in the first instance but a special type of concrete presentation, derived from sensory impressions of a particular kind, and that they only later acquire higher-order meanings when brought into associative connection with *Objektvorstellungen*. Thus the symbolic, non-figurative psychological process arises secondarily out of a combination of the two primary orders of *Vorstellung*. See the exchange of views on this subject between Jones and Strachey, cited by Steiner (1984).

This leads to a second set of difficulties, namely the fact that the terms *Sachvorstellung*, *Dingvorstellung* and *Objektvorstellung* were used in a variety of different senses in the course of Freud's writings. Strachey draws attention to these developments in *SE*, **14**, 201 *n*. 1, 209/*RSE*, **14**, 177 *n*. 1, 186. In his early neurological writings, Freud (1891*b*) used the terms *Objektvorstellung* and *Wortvorstellung* to refer to (primary) concrete and (secondary) verbal representations of the external world respectively. In *The Interpretation of Dreams* (1900*a*) the former term was changed to *Dingvorstellung*. In his (1915*e*) essay on 'The Unconscious' it was changed again, to *Sachvorstellung*, and the term *Objektvorstellung* now denoted a complex made up of the combined *Sachvorstellung* and *Wortvorstellung*. Then in 'Mourning and Melancholia' (1916–17*g* [1915]), the term denoting the former concept reverted to *Dingvorstellung*.

Strachey (ibid.; *SE*, **14**, 201 *n*. 1/*RSE*, **14**, 177 *n*. 1) described *Sachvorstellung* and *Dingvorstellung* as synonyms; accordingly, he rendered them both by a single English equivalent, '**thing**-presentation'. There is, however, a slight shift in meaning in the original German; *Sache* has somewhat less material connotations than *Ding*. In addition, unlike *Sache*, *Ding* (in this context) evokes Kant's philosophy, and thus refers to something which can never be consciously presented. This putative distinction is obscured by Strachey's rendition of both *Sache* and *Ding* by the English 'thing'. *Objekt*, on the other hand, which is derived from the Latin *objectus* – a casting before – is inherently mental. For Kant an *Objekt* is a mental construction made out of sensations corresponding to a *Ding* in external reality (Rizzuto, 1990, 243). Cf. Green (1986, 146), who asserts that 'there is no difference at all between thing- and object-presentation'.

Notwithstanding Freud's interest in Kant's philosophy (Solms, 1997*a*), it is not at all certain that he had such distinctions in mind, for there is a large degree of overlap

in the everyday usage of these words. If he did, the implication is that, whereas *Wort-*, *Objekt-* and perhaps even *Sachvorstellungen* can achieve consciousness, *Dingvorstellungen* cannot do so, except by way of the other varieties of *Vorstellung*.

Wahrnehmungsidentität. See *Denkidentität*.

Wortvorstellung. See *Vorstellung*.

Zivilisation. See *Kultur*.

Zwang, *Zwangsneurose*, *Zwangsvorstellung*. Literally translated, *Zwang* means **compulsion**. However, for reasons of nosographic convention, Strachey frequently translated it as **obsession**.

Strachey (*SE*, **3**, 72/*RSE*, **3**, 66) remarked that Freud, when writing in French (1893*c*, 1895*c*, 1896*a*), always translated *Zwangsvorstellung* by the French *obsession*. Strachey accordingly used **obsession** (an English usage which, as he pointed out, goes back to the seventeenth century). Strachey also used **obsessional idea** if the sense demanded it. He remarked that Freud's French usage 'ought to set at rest any uneasy feeling that the proper English version should be "**compulsive idea**" or something of the sort' (ibid.). Strachey remarked further that 'there seems to have been no German equivalent to the French and English word [obsession] until Krafft-Ebing introduced "*Zwangsvorstellung*" in 1867' (ibid.).

This overlooks two facts. Firstly, in the very papers cited by Strachey (e.g. 1893*c*), Freud found it necessary to use the French term *idées obsedantes*. Secondly, Freud (1909*d*) specifically rejected the term *Zwangsvorstellungen* on the grounds that it 'heap[s] together . . . the most heterogeneous psychical structures':

> In point of fact, it would be more correct to speak of 'obsessive thinking' ['*Zwangsdenken*'], and to make it clear that obsessional structures can correspond to every sort of psychical act. (*SE*, **10**, 221/*RSE*, **10**, 168.)

Additional complications are introduced by the fact that Freud actually used two distinct German terms in a paper which came to Strachey's attention only after he had published his remarks on the translation of this term (Freud, 1895*h*; *RSE*, **3**, 129–32), namely *Zwangsvorstellung* and *Obsession* (Solms, 1989, 91 *n*. 3). The English 'obsession' must obviously be reserved for the latter term, which suggests that the former term should, after all, be rendered as 'compulsive idea' or some equivalent.

Laplanche & Pontalis (1973, 281) point out that the very notion of 'obsessional neurosis' (*Zwangsneurose*) was, in fact, introduced into psychiatric nosography by Freud himself, in 1894–95 (cf. Strachey's 1960 letter on the subject to the editors of Jung's *Collected Writings*, cited by Laplanche, 1992, 397). Laplanche (1992) argues that Freud deliberately invented the concept in order to facilitate connections between 'obsessional' and other forms of compulsion: 'He uses *Zwang* not only for the obsessional neurosis, but [also] for hysteria, for psychosis and for perversion, and . . . many other uses which are completely lost with the term *obsession*' (ibid., 52).

Freud's usage of *Zwang* thus covers 'an immense domain where psychic **constraint** reigns' (Laplanche, 1997, 60). Perhaps the most important example of the

latter type would be *Wiederholungszwang* ('repetition compulsion'). On these grounds, Laplanche & Pontalis (1997, 60) appear to call for the uniform translation of *Zwang* and *zwanghaft*, etc., by the English 'compulsion', 'compulsive', etc. Against Laplanche's view, account needs to be taken of the fact that Freud (1904*f*; *RSE*, **7**, 233) rejected as 'artificial' an attempt by Löwenfeld to group together under a single heading all the 'phenomena of psychical compulsion' (*psychischen Zwangserscheinungen*). Freud's view was that it was 'not expedient . . . to use the concept of "compulsion" in its logical sense for purposes of [nosographic] delimitation' (ibid., 234). Huish (2002) solves the problem by invoking the compound '**obsessive-compulsive**', in line with modern nosographic usage.

Steiner (1987, 70 *n*. 53) and Solms (1989, 91 *n*. 3) draw attention to an English term that was in common usage at the time that Freud wrote these papers, namely **imperative ideas** (cf. Hack Tuke, 1894; Michell Clarke, 1896). Adolf Meyer (1905) spoke of 'imperative neurosis'). Steiner (1987, 69) also mentions **compulsory ideas**, which was a less common usage.

Incidentally, in a letter dated August 2, 1920, Jones asked Freud how he would translate the latter term – doubly underlining *Zwang* – but Jones did not receive a reply.

APPENDIX: STRACHEY'S NOTES

NOTES ON SOME TECHNICAL TERMS WHOSE TRANSLATION CALLS FOR COMMENT[1]

Abwehr. I have accepted the established translation **defence**, though this gives a more passive impression than the German. The true sense is given better by **to fend off**, which I have used for the cognate verbal form '*abwehren*'. [1, xxiii]

Affekt, *Empfindung*, *Gefühl*. These three words have different meanings when they are used strictly: **affect** (not an everyday English word), **sensation**, and **feeling** (or **emotion**). The trouble here is that all these words in both languages cover very uncertain ground, and that the meanings of the German and English words do not coincide but overlap. In particular, the German '*Empfindung*' can represent both 'sensation' and 'feeling' in English. Enquirers may be referred to the two main passages where these difficulties arise: in Section III of the metapsychological paper on 'The Unconscious', *Standard Ed.*, **14**, 177–8 [*RSE*, **14**, 156–8] (*G.W.*, **10**, 275–7), and in Lecture XXV of the *Introductory Lectures*, *Standard Ed.*, **16**, 395 [*RSE*, **16**, 349] (*G.W.*, **11**, 410). In these passages, and especially in the second one, it seems necessary to translate '*Empfindung*' by 'feeling'. (Similarly at the beginning of Chapter VIII of *Inhibitions, Symptoms and Anxiety*, *Standard Ed.*, **20**, 132 [*RSE*, **20**, 117], *G.W.*, **14**, 162.) But, if so, '*Gefühl*', in these same passages, cannot be translated 'feeling'. I have therefore rendered it by 'emotion' instead. That Freud himself had flexible views on the use of these words is shown, among other things, by the fact that in his early French paper on 'Obsessions and Phobias' he regularly uses '*état émotif*' as equivalent to the German '*Affekt*' (e.g. *G.W.*, **1**, 346).

Angst. **Anxiety** is the conventional translation of the term. This is discussed in a special Editor's Appendix to Freud's first paper on anxiety neurosis in *Standard Ed.*, **3**, 116 [*RSE*, **3**, 104].

Anlehnungstypus. **Anaclitic** (or **attachment**) **type** (of object-choice). This term is discussed in an Editor's footnote to the paper on narcissism, *Standard Ed.*, **14**, 87 *n.* [*RSE*, **14**, 76 *n.*].

Besetzung. **Cathexis**. The origin of this term is explained in a footnote to the Editor's Appendix to the first paper on the neuro-psychoses of defence, *Standard Ed.*, **3**, 63 *n.* [*RSE*, **3**, 57 f. *n.* 3].

1 [These are Strachey's original notes, reprinted as they appeared in *SE*, **1**, xxiii–xxvi, apart from the fact that they have been typeset in conformity with the editorial style used in the *RSE* 'Notes on the Translation of Some Technical Terms', which appear above.]

Instanz. **Agency**. The German term seems to have made its first appearance in [I, xxiv] Chapter IV of *The Interpretation of Dreams*, *G.W.*, **2–3**, 149 (*Standard Ed.*, **4**, 144 [*RSE*, **4**, 128]). There, and in many other places in the same work, '*Instanz*' is equated with '*System*'. It seems probable that Freud derived the metaphor from legal terminology, where it refers to the power or jurisdiction of a court or, more loosely, to the court itself. Actually (as is shown by the Oxford Dictionary) a similar usage of the word **instance** exists in English. It has become almost obsolete, however, except in the one phrase 'a court of first instance'. The English word has, on the other hand, a multiplicity of common modern usages, and as a translation of '*Instanz*' could lead to nothing but confusion. Hence I have introduced the indeterminate word 'agency', which seems to cover the essence of the German concept.

Phantasie. **Phantasy**. The spelling of this word causes a good deal of annoyance. The 'ph' form is adopted here on the basis of a discussion in the large Oxford Dictionary (under **Fantasy**), which concludes: 'In modern use *fantasy* and *phantasy*, in spite of their identity in sound and in ultimate etymology, tend to be apprehended as separate words, the predominant sense of the former being "caprice, whim, fanciful invention", while that of the latter is "imagination, visionary notion".' Accordingly, the 'ph' form is used here for the technical psychological phenomenon. But the 'f' form is also used on appropriate occasions (see, for instance, *Standard Ed.*, **17**, 227 and 230 [*RSE*, **17**, 222, 223 and 225]).

Psyche – psychisch; *Seele* (or *Seelenleben*) – *seelisch*. **Psyche**, **psychical**; **mind**, **mental**. Though I have as a rule used the English equivalent forms, I believe that Freud uses the two alternatives as precise synonyms. This is shown in many places. For instance, in Chapter VII (B) of *The Interpretation of Dreams*, though '*psychischer Apparat*' is more common, '*seelischer Apparat*' occurs more than once (*G.W.*, **2–3**, 541–3; *Standard Ed.*, **5**, 536–8 [*RSE*, **5**, 478–81]). So, too, in the first of the *Introductory Lectures* (*G.W.*, **11**, 14–15; *Standard Ed.*, **15**, 21–2 [*RSE*, **15**, 20–1]) '*psychisch*' and '*seelisch*' are constantly used interchangeably. And, indeed, at the beginning of his contribution to *Die Gesundheit* (*G.W.*, **5**, 290; *Standard Ed.*, **7**, 283 [*RSE*, **7**, 241]) he explicitly asserted the synonymous character of the two terms.

Trieb. **Instinct**. My choice of this rendering has been attacked in some quarters with considerable, but, I think, mistaken severity. The term almost invariably proposed by critics as an alternative is **drive**. There are several objections to this. First, I should [I, xxv] like to remark that 'drive', used in this sense, is not an English word and, as I have explained in my preface, this translation aims at being a translation into English. This use of the word 'drive' is not to be found in the large Oxford dictionary, or in its first supplement of 1933 (though this was sufficiently up to date to include 'cathexis'). And it will not be found in any of the regular English text-books of psychology. The critics obviously choose it because of its superficial resemblance to the German '*Trieb*', and I suspect that the majority of them are in fact influenced by a native or early familiarity with the German language. It would, however, be absurd to reject the word on that account, if its introduction promised to result in substantial gains. There seems little doubt that, from the standpoint of modern biology, Freud used the word '*Trieb*' to cover a variety of different concepts. The number of

terms now employed in this connection to denote an equally numerous assembly of distinct but related notions is clearly shown in a contribution of some twenty-five pages by R. A. Hinde on 'Some Recent Trends in Ethology' in Volume II of Koch's *Psychology: a Study of a Science* (New York, 1959). In the course of his elaborate analysis he shows that the word 'drive' itself is 'used in at least three ways' (p. 585). It requires, I think, a very brave man seriously to argue that rendering Freud's '*Trieb*' by 'drive' clears up the situation. It is not the business of a translator to attempt to classify and distinguish between Freud's different uses of the word. This job can safely be left to the reader, provided only that the same English word is invariably used for the German original. (Incidentally, Freud himself explains pretty clearly what he means by it in one at least of its senses at the beginning of his metapsychological paper on 'Triebe und Triebschicksale', *G.W.*, **10**, 211 ff. and *Standard Ed.*, **14**, 118 ff. [*RSE*, **14**, 103 ff.].) The only rational thing to do in such a case seems to me to be to choose an obviously vague and indeterminate word and stick to it. Hence my choice of 'instinct'. The only slight complication is that in some half-dozen instances Freud himself uses the German '*Instinkt*', always, perhaps, in the sense of instinct in animals.[1] In every such case, however, attention has been drawn to this fact in a footnote. Another consideration, comparatively unimportant except to a translator, is the impossibility of finding an adjectival form for 'drive'. How do the critics propose to translate '*Triebregung*'? I have seen it given as **instinctual drive**, which is a mistranslation as well as a surrender. **Drive impulse**? I confess to preferring my own **instinctual impulse**. [1, xxvi]

Unbewusst. **Unconscious**. Some discussion of the translation of this term appears in a footnote to the Editor's Note to 'The Unconscious', *Standard Ed.*, **14**, 165 *n.* [*RSE*, **14**, 146 *n.*].

Unlust. **Unpleasure**. Here the critics come from *this* side of the ocean and it is they who declare that this is not an English word. Earlier editors gave way to these cries and, in the *Collected Papers*, for instance, translated '*Schmerz*' by 'pain' and '*Unlust*' by **'pain'** (in inverted commas). The *reductio ad absurdum* of this subterfuge was the passage in 'Mourning and Melancholia' (*G.W.*, **10**, 430; *Standard Ed.*, **14**, 245 [*RSE*, **14**, 219]) where we find '*Schmerzunlust*', which would have to be translated 'pain-"pain"'. Fortunately the Oxford Dictionary comes to our help once more, this time in the opposite direction. For it tells us that 'unpleasure' was used by the poet Coleridge in 1814 – a revelation by which, no doubt, everyone will be satisfied. I have invariably translated '*Unlust*' by 'unpleasure', '*Schmerz*' by 'pain' and '*peinlich*' by 'distressing'.

1 Though in one of these instances at least, in a letter to Fliess (No. 71, of October 15, 1897 [*SE*, **1**, 266/*RSE*, **1**, 292]), he uses '*Instinkt*' as an apparently complete synonym for '*Trieb*' in a human being.

B
ANNOTATIONS TO INDIVIDUAL TRANSLATIONS

VOLUME I

p. 176, line 2:
des absoluten Traumas. Eissler (1994, unpublished letter to the Editor of the *RSE*) points out that this should have been translated 'absolute trauma**'**, in the singular, as it was in Strachey's earlier (1950) translation (*CP*, **5**, 26).

p. 212, line 2:
Mädchen freien Standes. Masson (in Freud, 1985*c*, 44 *n*. 2) and Wilson (1987, 301) point out that this phrase refers not to '**respectable** girls' but rather to '**unattached** girls', that is, unmarried women theoretically available to engage in sexual acts. Schröter (in the German edition of Freud, 1985*c*, 32 *n*. 10) and Eissler (1998, unpublished letter to the Editor of the *RSE*) agree with this opinion.

p. 213, line 5 f.b.:
sie hat nach kurzer Zeit zuerst Hysterie. Masson (in Freud, 1985*c*, 58) suggests 'after a short time she **initially** developed hysteria' but he concedes that he may be wrong.

p. 222, line 15:
ausfällt. Masson (in Freud, 1985*c*, 83 *n*. 2) suggests that this sentence could also read '. . . for as a rule this is properly **absent** only in potent men', due to the possible antithetical meaning of *ausfallen*.

p. 262, line 20:
Versagung. Mahony (1980, 467) says that *Versagung* – which is the word Freud used here – is not normally translated as **repression**, and points out that it implies **denial** or **counter-saying**. This comment seems to have arisen from a misreading on Mahony's behalf, as Strachey actually translated *Versagung* as **failure** here, as he frequently did. (See p. 93 above.)

p. 269, line 10 f.b.:
fällt ein. Masson (in Freud, 1985*c*, 225 *n*. 2) complains that this means '**think of**' rather than '**invent**'. The implication (for Masson) is that the seduction is remembered rather than phantasized. Literally translated, the phrase means 'the same old cruel story **occurs to** the victims'. Freud's wording, therefore, makes no specific claim regarding the issue raised by Masson.

p. 320, lines 1–5:
Vorgänge [*wie*] *Reiz* [,] *Substitut*[*ion*], *Konversion* [,] *Abfuhr*[,] *die dort zu beschreiben waren, haben direk*[*t*] *die Auffassung der Ner*[*ven*]*erreg*[*un*]*g als fliessende Quant*[*ität*] *nahe gelegt*. Diercks & Skale (2021) point out that two of the commas in this abbreviated sentence that were filled in by the editors of previous editions (both German and English) could plausibly be replaced with hyphens, giving a different meaning: *Vorgänge* [*wie*] *Reiz***[-]***Substitut*[*ion*], *Konversion***[-]***Abfuhr*[,] *die dort zu beschreiben waren, haben direk*[*t*] *die Auffassung der Ner*[*ven*]*erreg*[*un*]*g als fliessende Quant*[*ität*] *nahe gelegt*. This translates as 'Processes such as **stimulus substitution and conversion discharge**, which had to be described there [in connection with **obsessions and hysteria, respectively**], directly suggested the conception of neuronal excitation as quantity in a state of flow.'

p. 324 *n*. 2:
Über-Erlernen. In an unpublished letter to James Strachey (December 21, 1964), Anna Freud questioned his translation of this term as '**re-learning**'. She pointed out that 'the German word seems to imply a too much, the English one a repetition'. Her query (which was made at proof stage) seems to have prompted the footnote that Strachey appended to his translation at this point, referring the reader to the equivalent *Überdenken* in *SE*, **1**, 335 *n*. 2/*RSE*, **1**, 360 *n*. 2. However, since 're-learning' still does not make complete sense in this context, it remains likely that '**overlearning**' better conveys the intended sense. The latter term has a specific technical meaning in psychology, namely, becoming automatic by virtue of repetition. Cf. '*Überdeterminierung*' and '*Überbestimmung*', which Strachey translated as 'over-determination' (see *SE*, **2**, 212 *n*. 1/*RSE*, **2**, 189 *n*. 1).

p. 324 *n*. 4:
Bahnung. Alan Bass, Jacques Derrida's English translator, makes the point that *Bahnung* literally means **pathbreaking**, and implies a sense of force. Accordingly, he translates Derrida's *frayage* by the (admittedly clumsy) '**breaching**' (Derrida, 1978, 329 *n*. 2). This disregards Sherrington's (1906) long-established translation of Exner's (1894) term *Bahnung* as 'facilitation'. (See p. 122 below.)

p. 333, line 13 f.b.:
Regeldetri. Pribram & Gill (1976, 20) inexplicably suggest that '**rule of hierarchy**' might be a better translation. The '**rule of three**' has several meanings, but hierarchy is not one of them.

p. 342, line 13 f.b.:
Der Erfahrung. This sense of '**experience**' is quite different from that of the 'experience [*Erlebnis*] of satisfaction'. Pribram & Gill (1976, 114) suggest that the distinction coincides roughly with the difference between external (sensory) and internal (bodily) experience respectively, and is therefore not without theoretical importance in the present work. More to the point is the fact that 'experience' in the sense of '*Erfahrung*' implies a learning experience, as in '**experience gained**'.

p. 410, line 23:
willkürlichen Anteil der spezifischen Aktion. Van der Vijver & Geerardyn (1992, xxvii) describe Strachey's translation of this phrase as 'the **volitional** component of the specific action' as 'incomprehensible'. Presumably they would have preferred it to be translated as 'the **willed** component . . .'.

VOLUME II

p. 8, line 6:
die Tat. Rizzuto (1992, 175) argues that this should have been translated as '**the deed**' rather than '**action**'.

p. 40, line 7:
grosse innere Logik. Slotkin (translating Grubrich-Simitis, 1997, 37 *n*. 27) questions Strachey's rendition of this phrase as '**such a degree of internal consistency**'. His more literal translation is '**such a degree of inner logic**'. If this alternative is accepted, the phrase '**her consistency**' two lines below would also have to be changed; the original German reads '*dieser Logik*' (literally '**this logic**'). What is at stake here is that the logic in question, while internally consistent, is idiosyncratic.

p. 90, line 14:
der grössten Entbindung von Leidenschaftlichkeit fähig. Luckhurst (2004, xxxix) suggests that this should be translated as 'capable of **delivering** the greatest passion', for the reason that *Entbindung* suggests delivery in childbirth. A more literal translation would be 'capable of **unleashing** the strongest passions'.

p. 124, line 7:
vollkommen zureichende Determinierung. Rizzuto (1992, 175) argues that Strachey's translation of this phrase as '**completely adequate set of determinants**' undermines the premise of Freud's argument; she suggests instead 'sufficient and complete **determinism**'. The point at issue here is that Freud is asserting the premise of psychical determinism.

p. 142, line 21:
aus meiner Zucht entlassen war. Slotkin (translating Grubrich-Simitis, 1997, 34 *n*. 20) points out that 'leaving my **care**' is too soft a translation of *Zucht* in this context; he suggests '**discipline**' instead.

p. 240, line 22:
Drängen. Luckhurst (2004, xl) suggests '**pushing**' to retain the physicality of the German – and the bodily language of the hysteric. *Drängen* can be translated more literally as '**urging**'.

VOLUME III

p. 12, line 9:
ein Seher. In an unpublished letter to Strachey (June 4, 1962), K. R. Eissler remarked that *ein Seher* is not only a person who is attracted mainly by visual impressions but also a person who can see what is not accessible to sense perception. Eissler suggested that '**a seer**' would better convey the full meaning of the phrase than does Strachey's '**a man who sees**'. Strachey evidently did not agree with Eissler on this point, for, although he incorporated into the *SE* Addenda and Corrigenda other suggestions that Eissler made in this letter, he ignored the present one.

pp. 43, heading, and 173, line 4:
Neuropsychosen. Freud seldom used this ambiguous term, which Sandler (1985, 8) and Laplanche & Pontalis (1997, 76) consider synonymous with '**psychoneuroses**'. This is incorrect. The contents of Freud's two papers on the topic (1894*a*, 1896*b*), and indeed the subtitle of the first paper, show that Freud had both neurotic and psychotic defences in mind. See also Freud's abstract of the paper (1897*b*; *SE*, **3**, 249 f./ *RSE*, **3**, 247 f.) where he expressly says it concerns both neuroses and psychoses.

p. 66, line 8:
'compulsive idea' or something of the sort. This evidently refers to a brief (unpublished) correspondence in 1960 between Strachey and the editors of Jung's collected works. The latter eventually accepted Strachey's arguments against the translation of *Zwang* as '**compulsion**' in any nosographic context. (See pp. 98–9 above.)

p. 220, line 7 f.b.:
das Kind . . . seinem Fuss . . . der Erwachsenen. Eissler (1994, unpublished letter to the Editor of the *RSE*) argues that the child referred to here was most likely female. The gender in the German original is neuter, but Freud never described a case of hysterical paraplegia in a male.

VOLUME IV

p. xiii:
Die Traumdeutung. See the discussion of the translation of this title in the 'Notes on the Translation of Some Technical Terms' above (pp. 61–3).

p. 11, line 3 f.b.:
Eines Nachts traümte ihm. Underwood (2006, 32 *n*. 2) warns the reader to be aware that the German literally reads 'one night **there dreamed to him**', which possibly reflects the question Freud is discussing: is dreaming an activity *of* the mind or is it experienced *by* the mind?

p. 48, line 1:
des Traumes. Here and elsewhere, Underwood (2006, 76 *n*. 5) translates this as 'dream' rather than '**a** dream', on the grounds that the German implies the whole spectrum from general to particular, whereas English obliges one to decide between the two.

p. 89 *n*., line 7:
Ein Traum ist in der Regel unübersetzbar in andere Sprachen. Steiner (2021) feels that Strachey's translation here makes Freud's statement sound more absolute than it is in the original, where the word 'impossible' does not appear. A more literal rendition would be: 'As a rule a dream is **untranslatable** into a foreign language'.

pp. 95–6:
Mahony (1977), who makes a number of comments on the translation of this dream, draws attention to the fact that Strachey habitually translated Freud's dream reports into the past tense, whereas in the original German they were reported in the present tense (cf. Crick, 1999, xlvi). The same applies to Freud's case histories (Mahony, 1982, 1984*a*, 1986, 1989, 1992*a*). In unpublished correspondence with Strachey, both Ernst Kris (letter dated May 14, 1953) and Anna Freud (letter dated May 21, 1954) commented on the resultant loss of immediacy, although both of them accepted that the present tense could not be sustained in English. Strachey was following English convention, which differs from German clinical writing in this respect. However, Mahony (1977, 1984*a*, 1992*a*) points out that the wish-fulfilling function of dreams actually demands that the dream-work translates the optative mood of the latent thoughts into the present indicative. (Thus 'Oh! if only' becomes 'It is'.) Cf. Freud (1900*a*), *SE*, **5**, 534–5/*RSE*, **5**, 477–8; (1905*c*), *SE*, **8**, 162/*RSE*, **8**, 141; (1916–17*a*), *SE*, **15**, 129/*RSE*, **15**, 113.

p. 134, line 16:
und diesen zeigte ihr der Traum erfüllt. Grünbaum (1984, 362–3) points out that in the original the words *zeigte ihr* imply that the manifest dream showed the wish fulfilment to the patient. Literally translated, therefore, it would read 'showed **her** that wish fulfilled'.

p. 146, heading:
Das Rezente und das Indifferente im Traum. Underwood (2006, 199 *n*. 2) argues that *Rezente* and *Indifferente* have connotations of '**live**' and '**neutral**' respectively. His point is that Freud is saying that some things in the past retain an ability to influence mental activity in the present while others do not. This point is difficult to sustain.

p. 187, line 2:
ich halte [*dem*] *vor* . . . In an unpublished letter to Strachey (dated September 29, 1962), K. R. Eissler pointed out that this phrase has a double meaning in German ('**I held before**' and '**I expostulated**') which is lost in Strachey's translation: '**I handed him** . . .' (cf. *GW*, **2/3**, 216). Eissler's concern about the double meaning of '*ich halte vor*' – if it has merit – could be accommodated by translating the phrase as '**I held forth**'.

p. 216, line 22:
um eine Einkleidung zu erfinden. Strachey's translation of this phrase as 'recast in a **form**' obscures a resonance between Freud's exegesis and the content of the dream. *Einkleidung* means literally '**clothing**' (Derrida, 1975; Mahony, 1984*b*). An alternative rendition might therefore be '**dressed up** in a form'.

p. 236, line 9:
Überdeutung. Underwood (2006, 291 *n*. 26) argues that this word has wrongly acquired the status of a technical term; what Freud means is simply that interpretation is never complete, one can always add another layer. Underwood (ibid., 279) accordingly translates '*der Überdeutung fähig ist*' as '**is capable of repeated interpretation, at a deeper and deeper level**'. It is important to recognize that Strachey's 'over-interpreted' here does not imply a too-much-ness. Freud's use of *Überdeutung* is entirely analogous to the technical term *Überdeterminierung*: dreams, like neurotic symptoms, being overdetermined, require **multiple lines of interpretation**.

p. 274, line 6 f.b.:
Werkmeister. Steiner (1988*c*, 415 *n*. 1) points out that this term, literally translated, means '**master craftsmen**', which has somewhat different connotations to '**governing factors**'.

VOLUME V

p. 305, line 21:
Hieroglyphenschreiber. Steiner (2021) believes that this should have been translated as 'hieroglyphic **writers**'.

pp. 393, line 2 f.b., and 394, line 1:
unvergleich schönen . . . in einer populären Vorlesung. Kaufmann (1980, 26) correctly points out that, strictly translated, *unvergleich schönen* means '**incomparably beautiful**' rather than '**exquisitely written**', and *in einer populären Vorlesung* means '**at a popular lecture**' rather than '**read aloud at a public lecture**'. His concern is that Strachey's translation of the former phrase suggests that Freud admired the style rather than the content of the essay; and that his rendition of the latter phrase suggests a public reading of the essay (where one is apt to know in advance what will be read, which was not the case in this instance).

p. 469, line 4 f.b.:
. . . die Stelle, an der er dem Unerkannten aufsitzt. Mahony (1992*a*, 33) suggests an alternative translation of this sentence; he emphasizes that the word *aufsitzt* translates literally as '**straddles** the unknown', whereas Strachey put '**reaches down into**'. See also *RSE*, **4**, 99 *n*. 1, where, literally translated, the German reads 'by which it **joins with** the unknown' (cf. Strachey's '**point of contact with**'). Less convincingly than he does with '*aufsitzt*', Mahony argues that, since *dem Unerkannten* ('the unknown') is derived from *erkennen*, which – like the English 'to know' – can be used in the biblical sense, the sexual connotations of these sentences are lost in Strachey's translation (cf. Anzieu, 1975, 215; Paskauskas, 1993, 77 [Freud to Jones, November 20, 1910]).

p. 522, lines 1 and 8:
Sperberköpfen. Jennifer Stone (1994, unpublished letter to the Editor of the *RSE*) points out that a *Sperber* is a **sparrowhawk**, not a **falcon**, as the *SE* had it. The footnote to Philippson's Bible cited by Strachey (*SE*, **5**, 583 *n*. 2/*RSE*, **5**, 521 *n*. 3) specifically mentions the *Sperber*. Stone draws attention to the interesting fact that the bird-god Horus, although associated by verbal tradition with the sparrowhawk, is represented pictorially with combined elements of the sparrowhawk and falcon (see Bénédite, 1909).

VOLUME VII

p. 7, line 7:
auf ein billiges Mass. Mahony (1996, 123–4) argues that Strachey mistranslated this phrase as '**partly**'. It seems more likely that the phrase has been overlooked entirely, and that Strachey's 'partly' refers to Freud's *anderseits*. The end of the sentence might therefore be more accurately translated as 'and partly [*anderseits*] of diminishing **to a fair degree** [*auf ein billiges Mass*] the expectations to which it will give rise'.

p. 9, line 9:
einer jugendlichen weiblichen Person. Mahony (1996, 35) argues for a more literal translation of this phrase: 'a young **female person**' (cf. Strachey's 'young **woman**'). It should be added that the word '*jugendlichen*' implies '**adolescent**'.

p. 10, line 16:
Fachgenossen. Mahony (1996, 124) suggests that '**other specialists**' might be a misleading translation of this term. He proposes '**colleagues**' instead. Another alternative would be '**fellow specialists**'.

p. 13 *n*. 1, line 22:
Erledigung des damaligen Konflikts. Mahony (1996, 117 *n*. 9) feels that Strachey softens this ambiguous term, *Erledigung*, rendering it as '**effected . . . relief**'. He argues that the German implies that Freud could do no more than '**manage**' the current conflict in this case. (In the present context, the ambiguity of the German is perhaps best conveyed by saying that only the current conflict was **dealt with** or **taken care of** or, at best, **settled**.) Risking pedantry, it might be added that '*damaligen*' would be more precisely translated here as '**then current**' than '**current**'.

p. 21, line 10 f.b.:
das Machtwort des Vaters. Strachey's translation as 'her father's **authority**' is conventional. Mahony (1996, 20) suggests a more graphic rendition: 'the **imperious words** of her father'. 'Her father's **command**' would equally convey Freud's meaning here.

p. 24, line 20:
Liebesantrag. Mahony (1996, 11 *n*. 9) suggests that 'make her an **overture of love**' better captures the ambiguity between making a proposal and a **proposition**. (Strachey's

SE translation was 'make her a **proposal**'.) A *Liebesantrag* is certainly closer to a 'proposition' than a 'proposal'. See also notes to pp. 35 and 94.

p. 24, line 4 f.b.:
Zumutung. Mahony (1996, 64–5) argues validly that Strachey's 'immoral **suggestions**' waters down the German term that Freud used here, which implies **impertinence**. A *Zumutung* is always inappropriate. (The same issue occurs on p. 94.)

p. 25, line 16:
Liebeswerbung. Mahony (1996) points out that, given modern English usage, Strachey's *SE* translation here ('**making love to**') is misleading. Mahony accordingly suggests '**wooing of**' as an alternative translation.

p. 25 *n*. 2, line 9:
Kontinuität. Eissler (1995, unpublished letter to the Editor of the *RSE*) suggests that this should be **contiguity** rather than **continuity**.

p. 26, line 14:
die Damen. Strachey's '**they**' is '**the ladies**' in the German original (Mahony, 1996, 9). Mahony draws attention to slippage in Freud's developmental designations of Dora, variously as 'child', 'girl' and 'lady'.

p. 26, line 24:
unberührten. Mahony (1996, 61 *n*. 8) suggests 'was **untouched**' (in the figurative sense of 'virginal') in place of Strachey's 'had **never before been approached**'.

p. 28, line 9 f.b.:
Die Scheu vor Männern. Mahony (1996, 61) argues that Strachey's '**avoidance of men**' is erroneous. He suggests '**nervousness at men**'. *Scheu* also has connotations of **fear**, **shyness**, **timidity**, **caution** and **inhibition**.

p. 35, line 15:
Ihre eigenen Magenschmerzen sagten aber aus. Mahony (1996, 41) suggests the more literal 'But her own stomach pains **spoke out**', in place of Strachey's 'But Dora's own gastric pains **proclaimed the fact**', in order to reveal the link between this moment and Freud's other descriptions of the phenomenon of a bodily organ 'joining in the conversation' (*mitsprechen*). In the present context, '*sagten aus*' could also be translated as '**testified**'.

p. 35 *n*. 1, line 4:
Werbung. Here and elsewhere in the *SE* translation, Strachey rendered this word as '**proposal**' (cf. *SE*, **7**, 73, 95, 106/*RSE*, **7**, 65, 85, 94). Mahony (1996, 11 *n*. 9, 65–6 *n*. 16) validly suggests '**wooing**' or '**courting**' instead. See notes to pp. 24 and 94.

p. 35 *n*. 1, line 5:
keineswegs plump oder anstössig. Mahony (1996, 64 *n*. 14) points out that the force of Freud's charge ('**not in the least** tactless or offensive') is lessened in Strachey's translation ('**neither** tactless **nor** offensive').

p. 57, line 10:
Robins (1991) offers alternative translations of 'Dora's' dreams (as, of course, does Whiteside, 2006). See also Mahony (1996, 77–8, 89). These authors have subjected Strachey's translation of the dreams and the whole of the present work to thoroughgoing criticism and revision. Not all of their remarks are noted here.

p. 59, line 11 f.b.:
im frischen Anlass zum Traum. Mahony (1996) suggests a more literal and precise translation: 'in the **fresh cause for** the dream', to replace Strachey's expanded: 'in the **exciting cause of the recent recurrence of** the dream'.

p. 74, line 14 f.b.:
einzuflössen. Mahony (1996, 133) suggests the more literal '**infuse**' in place of Strachey's '**inspire**'. '**Instil**' would perhaps be better.

p. 84, line 3:
eine erwünschte Bestätigung. Mahony (1996, 86 *n*. 9) understandably suggests '**desired** confirmation' in place of Strachey's '**desirable** confirmation'.

p. 94, line 11:
sehr umworben. Mahony (1996, 11, 67) points out that, given modern English usage, Strachey's *SE* translation of '**making violent love**' is misleading. He suggests '**ardently** courting' instead. Cf. notes to pp. 25 and 35.

p. 94, line 7 f.b.:
Zumutung. See discussion of the translation of this word in the note to p. 24, above.

p. 94, line 3 f.b.:
Ich habe nichts an meiner Frau. 'Dora's' father used almost exactly the same words: '*Ich habe nichts an meiner eigenen Frau*'. Whiteside (2006) points out that the phrase is not in common use, and speculates on the possible implications.

p. 97, line 3:
Aber er war wohl nie ganz aufrichtig. Mahony (1996, 117 *n*. 9) points out that Strachey's rendition of this sentence ('But **it must be confessed** that Dora's father was never entirely straightforward') has misled some readers to infer that Freud felt some shame on this score (e.g. Gallop, 1982, 142). Literally translated, the German merely reads: 'But he **surely** was never entirely straightforward'. Perhaps a better translation would be: 'But **it must be said** that Dora's father was never entirely straightforward'. It should be added that '*nie ganz aufrichtig*' implies 'never entirely **honest**'.

p. 105, line 2:
Heimlichkeit und einen krummen Umweg. Mahony (1996, 3) feels that Strachey's rendition ('secrecy and roundabout ways') omits the word *krummen* in the original German, and thereby tones down Freud's criticism of 'Dora's' father. Mahony suggests 'secrecy, **deviousness** and a roundabout way'. An adequate translation might be 'secrecy and devious ways'.

VOLUME VIII

p. 6, line 18:
Der Witz. Crick (2002, xxxii) argues on two grounds that Strachey's translation of *der Witz* as '**jokes**' should be supplemented by '**witticisms**' (an option that he considered but rejected; see *SE*, **8**, 7 *n*. 1/*RSE*, **8**, 6 *n*. 1). Firstly, she argues that 'witticism' is a more appropriate description than 'joke' for a great number of Freud's examples. Secondly, it provides a helpful means of negotiating the dual use of the German *Witz*, which covers '**wit**' in general and a specific joke. Crick concedes that the problem is not really soluble in English but argues that 'witticism' at least provides a transitional form. She also frequently replaces Strachey's 'jokes' with the abstract singular: '**the joke**' (as she does in the title of her translation of the present book). This correct use of the singular of the ideal type is, for Crick, a reminder of the latent nineteenth-century idealism underpinning Freud's theoretical assumptions in this book. – Crick is also of the opinion, incidentally, that '**jest**' is an outmoded word; she therefore uses '**pleasantry**' (or '**banter**') where Strachey uses 'jest'.

p. 11, line 1:
Witz. Crick (2002, 10 *n*. 3) points out that Jean Paul is here referring to wit, not jokes. The full aphorism (as translated by Margaret Hale) runs: 'Freedom gives wit (and equality too), and wit gives freedom.' Cf. Strachey's remarks in the Editors' Preface (*SE*, **8**, 7–8/*RSE*, **8**, 6).

p. 71, line 1:
'*Aesoi*.' Crick (2002, xli) points out that Strachey's rendition of this exclamation strips it of its Yiddish quality. The Yiddish term means literally '**ah so!**'. Crick translates it as '**Ai – ai – ai**', following Rosten (1970). – The same concern applies, perhaps more tellingly, to the cry of the Baroness in the following example. In the original German, Freud has her cry '*Ai, waih, waih*', which Strachey translates as '**Aa-ee, aa-ee, aa-ee**'. Crick (2002, 70) does not translate the cry; she merely points out that '*O weh*' and '*Oy vay* [*is mir*]' are equivalents. In fact, the joke pivots on the suppressed Jewishness of the Baroness.

p. 80, line 2 f.b.:
Einkleidung. Literally '**clothing**' (see Crick, 2002, 113 *n*. 3).

p. 104, line 23:
unterscheiden sich nur darin, dass. Many critics of Strachey's translations draw attention to his tendency to expand '*dass*' ('that') into '**the fact** that' in noun-clause constructions. The present instance may serve as an example. Where Strachey put

'cases of an internal and an external obstacle differ only in the fact that . . .', Crick put 'the only difference between cases of internal and external obstacles is that . . .'. The difference referred to in the example is not strictly a fact but rather a theoretical construct. Similar examples abound in Strachey's translations, which are less syntactically awkward but have Freud asserting more facts (Crick, 2002, xxxiv).

p. 169, line 21:
dem der 'Einfühlung' und dem des Ichs. Pigman (1995, 245) points out that this parenthetical phrase could have been more simply and accurately translated as '**the one of "empathy" and the one of the self**'. Crick (2002, 190) similarly offers: '**that of the "empathy" and that of our self**', but adds a note expanding her translation into a quasi-explanation: 'the difference between the effort I assume by empathy is expended by the other person and the effort I would expend myself' (ibid., 229 *n*. 5).

VOLUME IX

p. 128 *n*. 2:
dir. McLintock (2003, 34 *n*. 4) points out that there is no printed emphasis on the personal pronoun 'me' in the German original (which also has 'you' rather than 'me', but the hero is addressing himself).

p. 204, line 13 f.b.:
Bewusstseinsentgang. In an unpublished letter to Strachey (dated January 10, 1958), K. R. Eissler pointed out that this German term does not necessarily imply an actual **lapse** of consciousness. He subsequently suggested **reduction** or **waning** of consciousness instead (letter dated February 19, 1958). The context seems to demand otherwise.

VOLUME X

p. 6, line 11 f.b.:
Entstellungen. Mahony (1993, 1245) points out that **distortions** would have been a more literally accurate translation of this word than Strachey's **emendations**. The very crux of an *entstellter* text is obscured.

p. 40, line 16:
Inquisition. Mahony (1993, 1248) questions Strachey's 'toned down' translation of this word as '**examination**'. However, it is important to add that Freud uses '*Inquisition*' playfully here, which is consistent with the sympathetic tone of this entire case report.

p. 78, heading:
Epikrise. Huish (2002, xxix) points out that Freud's medical readers would have understood this term to imply 'critical evaluation of the course of the illness'. The term is entirely conventional in clinical report writing; it refers to the concluding analytical summary of a case history.

p. 120, line 13 f.b.:
in welchen uns die Einfühlung leichter gelingen müsste. Pigman (1995, 248) points out that this could be translated more literally as 'with which we should more easily succeed in **empathizing**'.

p. 122, line 6:
verehre. Mahony (1986, 142 *n*. 14) objects that '**admired**' tones down the force of the Rat Man's 'distancing veneration'. Mahony reasonably suggests '**revered**' instead.

p. 128, line 20:
ihm zwei Kometen zu schenken. Strachey opts for a figurative translation; a literal one would be '**gift him two comets**'.

p. 137, line 13:
anerkennendes Urteil. Mahony (1986, 112, 1992*a*, 42) points out that Strachey has here reduced Freud's supportive comment, which translated literally reads: 'I express an **appreciative judgement** of him', rather than: 'I said a word or two upon the **good opinion** I had formed of him'.

p. 143, line 7, heading:
Einige Zwangsvorstellungen und deren Übersetzung. A number of commentators have questioned Strachey's rendition of the last word in this heading – '**explanation**' (e.g. Mahony, 1986, 1992*a*). An *Übersetzung* is simply a '**translation**'. (See p. 89 above.)

p. 147, line 23:
aufgehoben. Mahony (1986, 193) draws attention to the highly pertinent antithetical meaning of this word. It translates as both '**annulled**' and '**conserved**'.

p. 149, line 7 f.b.:
'only'. Mahony (1986, 192) draws attention to the fact that this word, which (he argues) gives rise to a possible *non sequitur*, does not appear in the original German.

p. 160 *n*. 2:
Spielratte. Mahony (1986, 21, 51, 52, 60, 62, 80, 104, 106, 112, 117, 189, 195, 206) draws attention to numerous other instances where the word **–rat–** or allusions to rats are embedded in the original German text. These allusions are lost in translation. See also Major (1971, 540–1).

p. 161 *n*. 3:
ohne Rückstand. Mahony (1986, 196 *n*. 11) draws attention to a possible financial allusion that he believes is lost in Strachey's translation of this phrase; he suggests that his '**entirely**' should rather have been '**without default**'.

p. 163, line 10 f.b.:
Kanälen . . . die den Abfall führen . . . überflüssig. Mahony (1986, 196 *n*. 12) suggests that this sentence should have been translated more literally, to preserve the allusiveness of Freud's language in relation to the previous sentence. In the original German he speaks of '**channels that carry waste**' rather than simply '**sewers**', and says it would be '**superfluous** to point out . . .' rather than '**unnecessary** to point out . . .'.

p. 169, line 8 f.b.:
abgewendet . . . ausführlicher. Mahony (1986, 23) points out that the implicit visual metaphor in 'turned **his eyes** away' and 'detailed **view** of them' is not to be found in the original German, which translates directly as 'turned away' and 'in a more detailed way'.

p. 228, line 12:
Hungerig und wird gelabt. '**He was hungry and was fed.**' Gay (1988, 266) feels that this translation does not capture the 'archaic terror' of '*Hungerig*' and the 'biblical resonance' of '*gelabt*'. He prefers '**Hungry and is refreshed**'; but he does not explain how this meets his criticisms of Strachey's rendition. See also Hawelka (1974, 211 *n*.). An alternative translation might be 'Hungry and was **tended to**'.

VOLUME XI

pp. 153, 167, 183, headings:
Liebeslebens. Whiteside (2006) points out that the last word in this subtitle, which literally means '**love-life**', is more direct than is Strachey's '**love**'. The German word refers primarily to romantic love. Whiteside accordingly suggests that '**erotic life**' is closer to what Freud intended.

p. 153, line 13:
Zusammenhänge. More literally '**couplings**'. Strachey translates the term as '**thought connections**' in *SE*, **12**, 148/*RSE*, **12**, 146.

VOLUME XII

p. 114, lines 18–19:
Leistungs- und Genussfähigkeit. Mahony (1997, 80) correctly points out that *Leistung* denotes not merely **work** (*Arbeit*) but rather **effective work** – that is, **performance** or **achievement**. Elsewhere, in similar contexts, Strachey's translations do convey this nuance (*SE*, **12**, 235/*RSE*, **12**, 231; *SE*, **16**, 453, 457/*RSE*, **16**, 401, 404; *SE*, **19**, 249/*RSE*, **19**, 250).

p. 136, line 10:
Einfühlung. Pigman (1995, 246) points out that '**sympathetic understanding**' is a misleading translation of *Einfühlung*, obscuring not only the technical importance of **empathy** but also Freud's conception of it. 'Freud is implying that empathy is a *sine qua non* of analysis: if the analyst cannot adopt an empathic stance, the positive

transference necessary to allow the patient to benefit from interpretations of his symptoms will not develop . . . Freud says nothing about sympathising with the patient' (ibid., 246; see also pp. 64–5 above).

p. 146, line 2 f.b.:
Beziehungsvorgänge. The meaning of this term, which Strachey translates as '**processes of reference**', is unclear. Reddick (2003, 246 *n*. 6) suggests '**relationary processes**'. An adequate translation might be '**interpersonal processes**'.

p. 151, line 3 f.b.:
Tummelplatz. Siri Hustvedt (2012) accepts that Strachey's rendition of this word as '**playground**' is a sound choice but points out that the German carries 'connotations of hurry and commotion among adults, not just children, as well as a figurative possibility – a **hotbed** of action' (ibid., 197). She reminds us that the transference, for Freud, is also a '**field of struggle**', or, more dramatically, a '**battlefield**' between analyst and patient. This is true, but it should be pointed out that *Tummelplatz* does not carry negative connotations. The word implies liberation from inhibition, something like a '**rollicking place**', a place where almost anything goes.

VOLUME XIII

p. 144 *n*. 1:
Respektive Elternkomplex. Mahony (1982, 69 *n*. 9) argues that Strachey's '**more correctly**' is an unwarranted addition to Freud's footnote. Literally translated, it reads 'Or, **rather**, their parental complex'.

VOLUME XIV

p. 63, heading:
Zur Einführung der Narzissmus. Reddick (2003, xxxii), who neglected to read the opening lines of the Editor's Note to this work, describes Strachey's translation of this title as a 'grave misrepresentation' on the grounds that the German title refers to the introduction **of** narcissism rather than an introduction **to** narcissism. Reddick is of the opinion that Strachey sought to imply that the theory of narcissism was already established, and suggests instead: '**On the Introduction of Narcissism**'.

p. 65, line 16:
Zauberkraft. Reddick (2003, xxxiii) aptly comments that any German-speaking child would understand that Freud is simply speaking here of the **magical power** of words, whereas even the most educated English speaker is likely to reach for a dictionary in the face of '**thaumaturgical power**' (*sic*).

p. 69 *n*. 1:
ersterwählte. Reddick (2003, 242 *n*. 13) argues against the view that the change was a misprint, on the grounds that Freud did indeed 'mention' this hypothesis a few paragraphs earlier.

p. 72, line 3 f.b.:
durchfeuchtet. Numerous commentators have criticized Strachey for using an obscure English word here, '**humected**', which means '**moistened**' or '**wet**'. However, neither of the latter English words is identical to Freud's German word and, more importantly, they do not describe what happens to the excited genital organ in males. In the present context, *durchfeuchtet* could be translated '**imbrued**' (a no less obscure English word) or '**infused**' (which begs the question, with what?). Perhaps '**suffused**' best conveys the intended meaning, but it too is not identical to *durchfeuchtet*.

p. 85, line 13:
Selbstgefühl. Reddick (2003, 245 *n*. 36) considers '**self-regarding attitude**' to be a bizarre rendition of the German. He points out that '**self-feeling**' was a technical term current in nineteenth- and early twentieth-century psychology. Freud's usage here seems equivalent to '**sense of self**'.

p. 88, line 3:
Perversionen wieder herzustellen. Reddick (2003, 245 *n*. 40) argues that the word here refers not to a reinstatement of perversions but to a restoration of the (once perverse) individual. This argument is difficult to sustain; *Perversionen* clearly refers to perversions and not to persons.

p. 108, line 15:
Triebverschränkung. Frankland (2005, xxii) suggests '**overlapping** drives'. '**Confluence** of drives' is the conventional English translation of Adler's term. However, the German word *Verschränkung* is closer in meaning to '**entanglement**' than it is to 'confluence' – or to 'overlapping', for that matter.

p. 129, line 3:
unwirksam. Holder (1988, 213) reasonably argues that this should have been translated as '**ineffective**' rather than '**inoperative**'.

p. 165, line 9:
zeitlos. Bance (2002, xxviii) asserts that the associations of '**timelessness**' are self-evidently wrong. He suggests '**time-free**' instead. However, the German word *zeitlos* is no less ambiguous than the English 'timeless' in this respect; they both denote an absence of time and an infinity of time (e.g. the works of Shakespeare and Goethe are *zeitlos*).

p. 217 *n*. 1:
Trauer. Reddick (2003, 265 *n*. 4) bemoans the standard translation of this term as '**mourning**', which in his view is 'much too closely associated with death and the grief of bereavement to fit Freud's use'. He suggests '**sorrow**' instead (ibid., 156). See Editors' footnote in *RSE*, **20**, 116 *n*. 1. '**Grief**' might be equally serviceable, but Freud's usage places emphasis on the psychological process (or work) of mourning rather than the affect.

p. 262, line 1:
fremden Zuhörer. More precisely translated, this means '**stranger's ear**'. Mahony (1994*b*) points out that Strachey's '**stranger**' omits a pregnant reference – in the present context – to the fact that the stranger was also a listener.

p. 262, line 19:
Pochen. Stone (1993, unpublished letter to the Editor of the *RSE*) and Mahony (1994*b*) point out that, although Strachey's '**knock**' is not incorrect, a *Pochen* may also be a **throb** or a **beat**, which have corporeal references that prepare the reader for the subsequent clitoral sensations. (See also *RSE*, **14**, 266 *n*. 1 and *SE*, **14**, 268/*RSE*, **14**, 267–8.) This is true but, in view of the lines that follow, it should also be noted that a clock or camera cannot make 'throbbing' or 'beating' sounds.

p. 262, line 6 f.b.:
zum Schweigen zu bringen. Mahony (1994*b*) aptly suggests '**silence**' in place of Strachey's '**abate**'.

VOLUME XV

p. 141, line 10 f.b.:
Mutterleib. Bettelheim (1983, 51–2) argues that this word – which literally means '**mother's body**' – would have been better translated as '**womb**' than '**uterus**' (see also *SE*, **5**, 354, 684/*RSE*, **5**, 316, 614). The point is valid but *Mutterleib* has affective connotations that are not readily conveyed by 'mother's body' or 'womb'; the word belongs in the same category as 'motherland', 'mother tongue' and 'mother's milk'.

VOLUME XVI

p. 269, line 12:
Scheide. Mahony (1996, 409 *n*. 1) points out that, although *Scheide* (which literally means '**sheath**') can be used colloquially to refer to the female genital as a whole, including the **vulva**, it is better translated as **vagina** here.

VOLUME XVII

p. 14, line 11:
schlimme Zeit. Huish (2002, 216 *n*. 3) points out that this phrase refers both to the boy's naughtiness and to the fact that it was a painful period for him. She suggests that this ambiguity is better conveyed by the adjective '**difficult** time'. Her suggestion achieves this, and is consistent with English understatement, but *schlimme* would perhaps be more precisely translated as '**distressing**' in this context.

p. 23, line 4 f.b.:
Geschlechtsglied. The editors of the *Oeuvres complètes de Freud* draw attention to the fact that this term has the double meaning of '**sexual organ**' (literally 'sexual

member') and '**member of the hereditary line**' ('lineage member'). The allusion to the latter meaning is lost in the translation, which nevertheless remains correct.

p. 34 *n*. 1, line 4:
vertrauenswürdig machte. Mahony (1984*a*, 115–16, 1984*b*, 849) points out that the phrase 'to make it **seem more** trustworthy' does not tally precisely with the German text. The insertion of 'seem more' weakens the projection slightly. Mahony (1992*a*, 42) argues that it might also mitigate the patient's low self-esteem and his enormous transferential dependence: 'the Wolf Man was so doubtful of his own assertions that he projected them onto Freud so as to lend them credibility' (ibid.).

p. 51, line 12:
nicht mehr in polemischer Absicht. Mahony (1984*a*, 116, 1984*b*, 850, 1992*a*, 42) points out that this phrase should read '**no longer** with a controversial aim in view'. The implication lost in Strachey's translation may be that Freud's original discussion of the concept had, in fact, been written with a polemical aim. It should be added that '**controversial**' is not identical to *polemischer* ('**polemical**').

p. 53, line 24:
regelmässig. Mahony (1984*a*, 87 *n*.) justifiably questions Strachey's translation of this German word. Strictly speaking, it means '**regularly**' or '**ordinarily**'. Ornston (1982, 417) likewise comments upon Strachey's translation of *regelmässig*, throughout the *SE*, as '**invariably**' or '**always**'. See also Mahony (1986, 167 *n*. 11).

p. 127, heading:
Eine Schwierigkeit der Psychoanalyse. Bettelheim (1983, 68 *n*. 1) argues that the title of this work should have been translated as '**A Difficulty of Psychoanalysis**', since 'nowhere in the paper does Freud speak of a "path" of psychoanalysis that some difficulty would obstruct'. Riviere translated it as '**One of the Difficulties of Psycho-Analysis**'. The issue at stake here arises partly from an ambiguity in the German regarding the locus of the difficulty; does it belong primarily to psychoanalysis or to its audience?

p. 127, line 3:
entfremdet. Bakman (2008, 31) decries Strachey's translation of this word as '**alienates**'. She prefers Riviere's '**estranges**' on the odd grounds that the latter (more recent) Latinate word sounds like a foreign word in English.

p. 181, line 2:
regelmässig. See note to p. 53, above.

p. 183, line 21:
gemeinsamer Harnentleerung. Ornston (1992, 3) points out that a literal translation of this phrase – namely '**emptying their urine together**' – evokes a somewhat different phantasy from Strachey's rendition, '**micturating in each other's presence**'.

VOLUME XVIII

p. 9, line 17:
energisch. Mahony (1982, 50) argues that Strachey's '**completely**' should be replaced with a literal translation: '**energetically**'. The intended sense seems to be '**firmly**'.

p. 15, line 4 f.b.:
Bemächtigungstrieb. White (2010) argues that the concept denoted by this term suffered two distortions – the first by Freud himself, who avoided the more direct expression of **power** in '*Machttrieb*' in order to distance himself from Adler's '*Machtstreben*', and the second by Strachey's translation of the term as 'instinct for **mastery**', which further denuded it of connotations of power. Freud does, in fact, use '*Machttrieb*' on p. 38 (*SE*, **18**, 39), but Strachey translates it, too, as 'instinct for mastery'. White (2010, 818) suggests that *Bemächtigungstrieb* should be translated as '**drive to gain power**'. Interestingly, in her *New German–English Psycho-Analytical Vocabulary*, Alix Strachey (1943, 11) recommended '**instinct to gain power**' or '**possessive instinct**', and reserved 'instinct for mastery' for *Bewältigungstrieb*. James Strachey typically translated both terms as 'instinct for mastery'. To clarify: the German term *Bemächtigungstrieb* implies a drive to mastery in the sense of **seizing or taking control and possession** of something or someone; the term *Bewältigungstrieb* implies a drive to mastery in the sense of **tackling, grappling with** or **accomplishing** something.

p. 18, line 4:
erraten. Strictly speaking, the German word means '**guess**' but it does imply 'guess correctly'. (See pp. 65–6 above.)

p. 26, line 10 f.b.:
Bahnung. Reddick (2003, 249 *n*. 26), apparently unaware of the neurophysiological prehistory of Freud's usage of this word (Freud, 1950*a* [1895]), considers '**facilitation**' to be a bizarre translation of it. He suggests '**path-making**' instead. (See p. 106 above.)

p. 32, lines 12 f.b. and 10–11 f.b.:
Tendenz. Mahony (1982, 70–1 *n*. 13) criticizes Strachey's 'cleaning up' of Freud's loose use of this term, by translating it first as '**purpose**' and then – immediately below – as 'general **rule**' (cf. *GW*, **13**, 33). Mahony draws attention to Freud's express attempt in Chapter VII (*SE*, **18**, 62/*RSE*, **18**, 59) to introduce a sharper distinction between 'tendency' and 'function'. A *Tendenz* does not have the teleological sense of a 'purpose' and it is weaker than a 'rule'; it is simply a **tendency**, **trend** or **leaning**.

p. 38, line 5:
Das Ziel alles Lebens ist der Tod. This sentence would be less startling to the English reader if '*Ziel*' were translated as '**destination**'. '**Aim**' implies more purpose than the German word '*Ziel*' necessarily does. However, Freud seems to have had 'aim' in mind.

p. 44, line 17:
grossartigen Konzeption. Eissler (1971, 170 *n*. 32) and Sulloway (1979, 402 *n*. 2) complained about Strachey's *SE* translation of this phrase ('**large conception**') that it did not do justice to the praise that Freud actually bestowed on Fliess here. Sulloway proposes that it should be '**magnificent conception**'. Anna Freud, in her (unpublished) corrections of page proofs for the *Standard Edition*, similarly commented to Strachey (in another context) that *grossartig* implies '**grandiose**', 'magnificent' or '**spectacular**'. Ornston (1985*a*, 388), on the other hand, describes Freud's phrase as a playful use of academic jargon, intended to express his doubt about the validity of Fliess's theories. He suggests that the phrase should have been translated as '**grand design**' or '**fantastic conception**'. Solms & Saling (1990, 29) draw attention to a similar turn of phrase in one of Freud's neurological works (1888*b*), where he described Meynert's neuroanatomical theories as a *grossartige Komposition*. Solms & Saling 'think it is enlightening that these phrases were both used in the context of general *criticism* of Meynert's and Fliess's . . . theories' (ibid.). They translate the latter phrase as '**grand composition**', arguing that '**grand**' retains the ambiguity between sarcasm and praise that is inherent in the German original. Reddick (2003, 84) translates *grossartigen Konzeption* as '**grand conception**', as we have done here in the *RSE*.

p. 52, line 14:
bewältigen. White (2010, 816) argues that Strachey's typical translation of both *Bemächtigung* and *Bewältigung* as '**mastery**' here leads to a further distortion, for the reason that his rendition of *bewältigen* as '**overpowering**' reverses the taming process Freud describes, whereby the destructive power of oral *Bemächtigung* is transformed into mere *Bewältigung* at the genital stage. Slotkin (translating Dorey, 1986, 330 *n*.) likewise points out that *Bemächtigung* implies mastery through **assimilation**. However, Reddick (2003, 260–1 *n*. 58) argues that 'mastery' is too weak for *Bewältigung*, on the grounds that it derives from *Gewalt* ('power', 'force', 'violence'). Reddick suggests '**control**' or even '**overcome**'. See p. 122 above.

p. 100, line 5:
das Ichfremde anderer Personen. Pigman (1995, 248–9) points out that Strachey's 'valiant' translation of this phrase – which touches on the philosophical problem of other minds – poses problems. He argues that what Freud is referring to is **the alien self of the other**. However, he concedes that if this is the case then the original German is itself unclear at this point, as *das fremde Ich* would have better conveyed the sense of 'the alien self' than *das Ichfremde*. According to Pigman, it is therefore possible that what Freud intended to convey was **what is foreign to the self of other people**, which makes a larger claim for empathy, namely that it enables us to understand things about other people which they do not understand about themselves (ibid., 249). This seems unlikely, since *Ichfremde* here surely refers to what is '**foreign to one's own self**', not what is foreign to the self of others. Freud's phrase confronts us with the inherent 'not-me-ness' of other minds. An adequate alternative to Strachey's translation might be '**that which is foreign to our ego in other persons**'.

p. 102 *n*. 1, line 6:
überhaupt. Basch (1983, 133) notes that the *SE* translation of this word as 'enabled to take up **any** attitude **at all**' was potentially misleading, since Freud is not saying that empathy allows us to adopt any attitude we please. However, it seems fairly obvious in the present context that 'any . . . at all' means '**the very possibility**' of taking up an attitude. See also the previous note, and Pigman (1995, 249–50).

p. 190, line 11 f.b.:
unerwünscht. Eissler (1994, unpublished letter to the Editor of the *RSE*) argues that Strachey's rendition of this word is not strictly accurate and can be theoretically confusing. The original German actually states 'yet it would be **undesirable** [literally '**unwished-for**'] for the dream . . .'. The literal rendition ('unwished-for') would probably be best here, given that Freud links this issue with the wish-fulfilment theory of dreams. Strachey's rendition can be traced back to Hubback's 1922 translation; *CP*, **4**, 410.

VOLUME XIX

p. 12, line 12:
einen Wortstreit. Where Strachey translates 'a **verbal dispute**' here, Riviere put 'a **war of words**'. Bakman (2008, 34) bemoans the fact that Strachey's descriptive adjective flattens Freud's expression. The intended meaning seems to be '**an argument about semantics**'. The word *Wortstreit* could also be translated as '**verbiage**'.

p. 15, line 1 f.b.:
die einzige Leuchte. Where Strachey translates '**our one beacon-light**', Riviere put '**the single stray of light**'. Bakman (2008, 34) decries Strachey's introduction of a concrete and 'technical' term in place of Riviere's melodious and poetic rendition of *Leuchte*. The exact meaning seems to be '**the only source of light**'.

p. 19, line 10:
ein quantitativ-qualitativ Anderes. Reddick (2003, 257 *n*. 24) complains that Strachey here 'incomprehensibly chooses to ignore Freud's notion of otherness'. Reddick translates the sentence as 'Suppose that whatever it is that becomes conscious as pleasure or unpleasure be defined as **quantitatively and qualitatively "other"** within the workings of the psyche' (ibid., 123). However, this is an overly literal translation of '*ein Anderes*', which means 'something **else**'. Freud is referring here to the metapsychological ontology of feelings, an ontology which he describes elsewhere as 'unknowable' (Freud, 1940*a* [1938]).

p. 20, line 4:
wahrgenommen . . . wahr gehalten. The editors of the *Oeuvres complètes de Freud* draw attention to this word play. Etymologically, *wahrnehmen* (to perceive) derives from 'take as true'.

p. 20, line 10 f.b.:
Reddick (2003, 257 *n*. 29) makes the point that the force of this sentence can only be appreciated by substituting the direct English equivalents of Freud's terms: we are essentially an '**it**' on top of which the '**I**' floats. This is no more true in the present case than it is in the translation of *Es* and *Ich* in general. (See pp. 68–72 above.)

p. 20, line 8 f.b.:
das Ich umhüllt das Es nicht ganz, sondern nur insoweit das System W *dessen Oberfläche bildet*. Freud's *dessen* (**its**) here is grammatically ambiguous; it could refer to the surface of the ego or the id. The context suggests the former because Freud states (just above) that the ego 'starts out from the system *Pcpt*.' and (just below) that the *lower* portion of the ego merges into the id. (See Fig. 1, *SE*, **19**, 24/*RSE*, **19**, 21.) Nevertheless, Reddick (2003, 257 *n*. 30) insists that it refers to the surface of the id. As Freud says on p. 21 (*SE*, **19**, 25) of the present work: 'It is easy to see that the ego is that part of the id which has been modified by the direct influence of the external world through the medium of the *Pcpt.-Cs.*; in a sense it is an extension of the surface differentiation.' Thus, on p. 33 (*SE*, **19**, 38) he asserts: 'no external vicissitudes can be experienced or undergone by the id, except by way of the ego, which is the representative of the external world to the id.' In other words, it only makes sense to speak of the system *Pcpt.-Cs.* as the surface of the id at a fictitious developmental moment, before it has been exposed to any external influences, i.e. before its differentiated surface (the acknowledged nucleus of the ego) is first stimulated and thereby first modifies the id – and therefore before it even begins to operate as a perceptual system. See also the Editors' Appendix B to this work (*SE*, **19**, 63 ff./*RSE*, **19**, 57 ff.).

p. 22 *n*. 2:
Reddick (2003, 258 *n*. 34) believes that this 'allegedly' authorized footnote puts a slant on Freud's words that he never intended. According to Reddick, when Freud writes '*Das Ich ist vor allem ein körperliches*' he does not mean that the ego is '**bodily**' in the sense of being derived from bodily sensations, but rather that it is itself '**corporeal**' or '**body-like**'. Reddick offers no evidence for this abstruse interpretation of Freud's intentions, and it is contradicted by his remark that the ego is 'the projection of a surface' analogous to the cortical homunculus, which is derived from bodily sensations. See also Freud's remark on p. 21 (*SE*, **19**, 25) of this work: 'For the ego, perception plays the part which in the id falls to drive.'

p. 28, line 2:
Untergang. See below (note to p. 167 *n*. 1) for a detailed discussion of the English translation of this word, along with '*Zertrümmerung*', translated as '**demolition**' in the *SE* and '**disintegration**' in the present, revised translation.

p. 31, line 14:
Seelenleben. Reddick (2003, 125) translates this as 'the repressed in their **inner souls**' on the grounds that the 'spiritual' aspect of the *Seele* is allegedly pertinent here. (See pp. 82–4 above for a detailed discussion of the English translation of *Seele*.)

p. 32, line 3 f.b.:
Überbau über die . . . Rivalitätsregungen. Reddick (2003, 261 *n*. 59) argues that the German here does not imply a static superstructure '**built upon**' a foundation of jealous feelings but rather a dynamic construct arising from such feelings, a construct which actually disguises and in effect sublimates them.

p. 34, line 5:
Wenn dem Ich die Bewältigung des Ödipuskomplexes schlecht gelungen ist, wird dessen dem Es enstammende Energie-besetzung in der Reaktionsbildung des Ichideals wieder zu Wirkung kommen. Reddick (2003, 261 *n*. 62) points out that Freud's *dessen* here is grammatically ambiguous. It could refer to the ego or the Oedipus complex. Strachey translates it as 'of **the latter**' rather than '**its**', thereby resolving the ambiguity in favour of the Oedipus complex.

p. 38, line 7 f.b.:
Nicht das nämliche, aber ähnliches geschieht bei der Überwindung der feindseligen Rivalität, die zur Homosexualität führt. Reddick (2003, 261 *n*. 68) accepts that Strachey's translation of this supposedly ambiguous sentence is plausible but he thinks the following alternative is more likely: 'Something very similar, albeit not quite the same, happens **in the process that leads to homosexuality, namely the overcoming of hostile feelings**.' However, this alters what Freud is talking about here. The sentence refers not to the overcoming of hostile feelings in the process that leads to homosexuality but rather to the subject matter of the previous paragraph: the 'Something very similar, albeit not quite the same', which happens in that process.

p. 43, line 9:
sich . . . dem Ich entgegenstellen. Reddick (2003, 262 *n*. 79) considers this translation to be erroneous; he renders the phrase as 'and **set about countering** the ego'. Strachey has 'and **stand apart from** the ego', which prioritizes the topographical over the dynamic meaning of *entgegenstellen*. The latter meaning would be conveyed by terms like 'and **oppose** the ego' or 'and **confront** the ego'.

p. 167 *n*. 1:
Untergang. This German word usually means **going under**, **going down** or **decline**. Accordingly, Alix Strachey (1943, 74) recommends Riviere's translation: '**passing** of the Oedipus complex'. James Strachey chose '**dissolution**'. However, Loewald (1979, 752–3), who provides a full discussion of the translation of this term, points out that *Untergang* can also have a rather stronger meaning than that implied by 'dissolution'. It can mean **extinction** or **downfall**, as it clearly does, for example, in Schreber's delusion of *Weltuntergang* ('**the end** of the world'). Loewald also notes that, in the body of the present paper, Freud uses the even stronger term *Zerstörung* ('**destruction**') in relation to the fate of the Oedipus complex. Strachey (*SE*, **19**, 173 *n*. 1; cf. *RSE*, **19**, 167 *n*. 1) likewise references Freud's earlier (1923*b*) use of the word *Zertrümmerung* ('**disintegration**') in this context. Slotkin makes similar points in his translation of Grubrich-Simitis, 1993 (1996, 262 *n*. 36), drawing attention to a clarification by Freud himself of his choice of '*Untergang*': 'It deals with the fact that the

Oedipus complex is not simply repressed, but is actually **demolished** [*demoliert*], **abolished** [*aufgehoben wird*]' (Letter to Ferenczi, March 26, 1924). This is echoed in Freud's (1925*j*) subsequent published remark: 'the complex is not simply repressed, it is literally **smashed to pieces** [*zerschellt förmlich*]' (*SE*, **19**, 257/*RSE*, **19**, 257).

p. 215, line 14 f.b.:
die Leidenschaften der Menschen, nicht der Wissenschaftler allein. Bance (2002, 87), who translates this as '**provide an impassioned reaction in [lay] people, and not just in scientists**', makes the unsustainable claim that Freud is here making a telling distinction between people and scientists – thereby revealing his 'real allegiances as a humanist and man of letters' (ibid., xxx).

p. 216, line 4:
mit dem allumfassenden und alles erhaltenden Eros. The editors of the *Oeuvres complètes de Freud* draw attention to the fact that this is most likely an allusion to Goethe's *Faust*, where the hero conceives of God as being '*der Allumfasser, Der Allerhalter*' (**all-embracing, all-preserving**).

p. 238, line 18:
Verurteilung. In an unpublished letter to Strachey dated February 26, 1958, Eissler suggested that this term should be translated as **disapprobation** or **disavowal**. Strachey made a large tick in the margin of the letter at this point (which usually indicated agreement), but Angela Richards did not include the change in the Addenda and Corrigenda (*SE*, **24**). If Strachey did agree with Eissler's suggestion, it would have been with 'disapprobation' rather than 'disavowal' (which translates as *Verleugnung*). However, 'disapprobation' lacks the connotations carried by *Verurteilung* of being **convicted** and **sentenced** in a court of law, and, moreover, it disrupts continuities with Freud's other theoretical discussions of the intellectual function of 'judgement'. On one occasion, Strachey used '**condemnation**' to qualify 'judgement', in a similar context to the present one (*SE*, **14**, 146/*RSE*, **14**, 129; see also *SE*, **10**, 145/*RSE*, **10**, 110).

p. 240, line 9:
'which'. In an unpublished letter to Strachey dated February 26, 1958, Eissler suggested that this 'which' (and by implication the following one) should be deleted, as it creates an ambiguity that does not exist in the German original, where it is clear that it is the judging rather than the motor action that puts an end to the postponement. Strachey made a large tick in the margin of the letter at this point, but Angela Richards did not include the change in the Addenda and Corrigenda (*SE*, **24**). It must be said that Eissler's concern arises only if one disregards the fact that Freud says that judging *decides the choice of* motor action. This removes the ambiguity as to what puts an end to the postponing; voluntary action cannot occur without the making of choices.

p. 240, line 12:
Tasten. Frankland (2005, 91) prefers '**feeling out**' to Strachey's '**palpating**', on the grounds that Freud used straightforward language.

p. 249, heading:
Geschlechtsunterschieds. Brandt (1961, 333) and Bettelheim (1983, 97) argue that this should have been translated as '**difference** between the sexes' rather than '**distinction**'. See also Laplanche (1991, 403).

p. 279, line 4 f.b.:
Anteilnahme . . . intuitive Einfühlung. Pigman (1995, 246) points out that Strachey's failure to translate *Einfühlung* as '**empathy**' in this context obscures the important theoretical distinction between 'empathy' and 'sympathy' (which is how Strachey here translates *Anteilnahme*). Less obviously, he argues further that Freud's qualification of *Einfühlung* by 'intuitive' emphasizes his essentially intellectual conception of the empathic process (ibid., 247 ff.).

VOLUME XX

p. 22, line 5 f.b.:
Nachdem die kathartische Arbeit erledigt schien, hatte sich bei dem Mädchen plötzlich ein Zustand von 'Übertragungsliebe' eingestellt, den er nicht mehr mit ihrem Kranksein in Beziehung brachte, so dass er sich bestürzt von ihr zurückzog. Mahony (1992*a*, 41) argues that this sentence contains a grammatical error in the original German: the initial action (*schien*, '**seemed**') was put in the past tense and the subsequent one (*eingestellt*, '**developed**') in the past perfect (i.e. '**had . . . developed**'). Further, Mahony draws attention to Freud's use of the phrase *nicht mehr* ('**no longer**'), which implies that Breuer had been aware of the transference before the end of the treatment. Mahony suggests that these alleged parapraxes ('eliminated' in Strachey's translation) indicated Freud's private misgivings about Breuer's countertransference difficulties and the limited success of this treatment. However, Grubrich-Simitis (1995) assures us that Freud's grammar (and therefore the translation) is formally correct and that *nicht mehr* does not have the claimed temporal sense in this context.

p. 52, line 12 f.b.:
meiner Unbefangenheit. Eissler (unpublished letter to Strachey dated March 7, 1963) points out that, although *befangen* does mean 'embarrassed', *unbefangen* would be better translated here as '**unbiased**' or '**unprejudiced**' than '**unembarrassed**'.

p. 77, line 9 f.b.:
In vielen Fällen scheint es der Willkür überlassen, ob man die positive oder die negative Seite des pathologischen Vorgangs betonen, seinen Erfolg als Symptom oder als Hemmung bezeichnen will. Reddick (2003, 264 *n*. 2) points out that the original German does not explicitly equate 'positive' with 'symptom' and 'negative' with 'inhibition' (although this was Freud's usual understanding of the mechanism of neurosis; cf. the return of the repressed). Reddick's alternative translation is therefore more literal than Strachey's: 'In many cases it appears to be a matter of purely arbitrary choice as to whether one stresses **the positive or the negative side of the pathological process and characterizes its outcome as "symptom" or "inhibition"**' (ibid., 153).

pp. 81, line 10, and 84, line 13:
unliebsam/*unliebsame*. Reddick (2003, 265 *n*. 6) suggests that this word should be translated as '**disagreeable**'. Since the German *unliebsam* allows for the possibility that the negative responses to the impulses in question are context dependent, '**unwelcome**' is perhaps a better alternative.

p. 129, line 4 f.b.:
Gewissensangst. Reddick (2003, 269 *n*. 56) argues that this definition of *Gewissensangst* as endopsychic and the differentiation of it from 'social anxiety' suggests that Strachey's translation of the term as '**moral anxiety**' severely distorts Freud's concept. Reddick's point is that *Gewissensangst* is not derived from social mores (i.e. it is not internalized morality). He suggests '**consciential fear**' instead. See the Editors' footnote in *SE*, **20**, 128 *n*. 1/*RSE*, **20**, 114 *n*. 1, where – among other things – Strachey points out that *Gewissensangst* literally means 'conscience anxiety' and that it might be rendered as 'fear of conscience'. Compare Freud's later views on this topic (1930*a*; *SE*, **21**, 128 ff./ ibid., **21**, 115 ff.).

p. 225, line 12 f.b.:
selbstverständlich. In an unpublished letter to Strachey (dated January 17, 1961), Eissler questioned the translation of this word as '**axiomatic**' and suggested '**self-evident**' instead.

p. 227, line 8:
möglichst korrekt. In an unpublished letter to Strachey (dated January 17, 1961), Eissler pointed out that the translation '**keeping as closely as possible to the rules**' can be misleading; he suggested that Strachey might change it to '**as correctly as possible**'. To clarify: in Freud's view, here, the doctors should stick to 'correct' procedures in the sense of **conventional** procedures.

VOLUME XXI

p. 45, line 13 f.b.:
irreligiösen. Underwood (2004, 158 *n*. 2) suggests '**non-religious**' on the grounds that the German word lacks the possible connotation of hostility to religion that attaches to '**irreligious**'.

p. 59, heading:
Unbehagen. Here there are two separate issues; firstly, the translation of the title of this book (*Das Unbehagen in der Kultur*) and, secondly, the translation of the German term *Kultur*. The latter question is discussed elsewhere (see p. 74 above); only the former question is discussed here.

Bettelheim (1983, 99) argues that a correct translation of the title would be '**The Uneasiness Inherent in Culture**'. If Strachey's rendition was correct, Bettelheim argues, Freud would have entitled the work: *Zivilisation und ihre Unzufriedenheiten* or *Die Unzufriedenheit mit der Kultur*, which have quite different meanings from the title that he did choose. Bettelheim's suggested alternative title is based upon two objections to Strachey's rendition.

Firstly, according to Bettelheim, the German '*in*' in Freud's title should have been translated as '**inherent in**' rather than '**and**', because the English word 'and' can and frequently does connect quite different things; whereas *in*, which can be translated by the English '**in**' or '**within**', clearly indicates that the two concepts *Unbehagen* and *Kultur* are somehow bound together and form a unit. This, Bettelheim argues, is precisely what Freud intended to convey, namely, that 'a certain discomfort is necessarily and unavoidably inherent in culture' (ibid., 1983, 100–1). This argument seems valid.

Secondly, as Bettelheim's literal retranslations of the title indicate, he argues that the word '**discontent**' has a German equivalent, *Unzufriedenheit*, which has a different meaning from *Unbehagen*. Here Bettelheim could have mentioned the fact that Freud used these two words to qualify each other at one point in the present work, when he writes: 'the sense of guilt produced by civilization . . . appears as a sort of malaise [*Unbehagen*], a dissatisfaction [*Unzufriedenheit*], for which people seek other motivations' (*SE*, **21**, 135–6/*RSE*, **21**, 122). Be that as it may, *Unbehagen* is the opposite of *Behagen*, which means 'comfort' or 'ease', and therefore (according to Bettelheim) should be translated as '**discomfort**' or '**uneasiness**'. However, it could also be said that *Behagen* is equivalent to the English word 'contentment', which implies that 'discontent' is an apt translation of *Unbehagen*. Nevertheless, for Bettelheim 'discontent' is too intellectual a term to convey the full meaning of *Unbehagen*. He considers 'uneasiness' to be the better of his two alternatives, on the grounds that Freud used the word *Unbehagen* to designate a feeling. Interestingly, Jones appears to have held similar views (Paskauskas, 1993, 667). However, it is left unclear why Bettelheim thinks 'uneasiness' designates a feeling more than 'discomfort' does.

Freud himself chose the other of the two alternatives; he suggested '**Man's Discomfort in Civilization**' in a letter to Riviere (letter dated December 30, 1929; see Strachey, *SE*, **21**, 60/*RSE*, **21**, 55–6). However, shortly afterwards, Freud wrote to Jones that 'I will not rack my brains over the translation of the title, which is certainly difficult' (letter dated January 26, 1930; Paskauskas, 1993, 668). That the precise meaning of the term was of special concern to Freud is indicated by the fact that he changed the title while writing the work, from *Das Glück und die Kultur* ['Happiness and Civilization'] to *Das Unglück in der Kultur* ['The Unhappiness in Civilization'] (Grubrich-Simitis, 1993, 214; trans., 167–8), and he only settled on *Das Unbehagen in der Kultur* shortly before going to press (i.e. between August 25 and October 19, 1929; cf. Strachey, *SE*, **21**, 59/*RSE*, **21**, 55; Paskauskas, 1993, 663, 666). Incidentally, Bettelheim is wrong to say that Freud also proposed '**malaise**'; the latter was Jones's suggestion (Paskauskas, 1993, 667).

Strachey (*SE*, **21**, 59–60/*RSE*, **21**, 55–6) concedes that it is difficult to choose an English equivalent for *Unbehagen*, suggesting that 'malaise' might have served, but states that he was ultimately persuaded that Riviere's elegant solution for the title (which he retained) was 'ideal'. Nevertheless, it is interesting to note that at some points in the main body of the text he translated *Unbehagen* as 'uneasiness' and 'malaise' (e.g. *SE*, **21**, 135/*RSE*, **21**, 122). Elsewhere, he also used 'discomfort' (e.g. *SE*, **20**, 128/*RSE*, **20**, 114).

One is left with the impression that the basis for Freud's indecision regarding which German word to use in the title is recapitulated in the vexed question of its

proper translation. Ultimately, Freud chose among the German alternatives the word that has the widest meaning, and for that word, sadly, there is no direct equivalent in English.

p. 120, line 5:
aufseufzen. In an unpublished letter to Strachey (dated November 15, 1966), Eissler argued that the sigh referred to here was intended to convey a bitter sense 'of **sadness**' (at the poet's unfair advantage over the scientist) rather than a sense 'of **relief**' (as Strachey had it in the *SE*). Eissler told the Editor of the *RSE* (letter dated April 26, 1993) that Strachey agreed with him on this point, but for some reason the correction did not appear in the Addenda and Corrigenda (*SE*, **24**). For the revised translation, it seemed best not to attempt to guess Freud's intended meaning.

VOLUME XXII

p. 54, line 3 f.b.:
'[in these patients]'. Ragg-Kirkby (2003, 171 *n*. 9) describes this editorial insertion as 'surely a gross distortion of Freud's views on religion and morality'. Presumably, she would prefer the editorial clarification to be inserted into the next sentence: 'For after a certain number of months the whole moral fuss is over **[in these patients]**, the criticism of the superego is silent, the ego is rehabilitated and again enjoys all the rights of man till the next attack.'

p. 58, line 2:
Aufstellung des Über-Ichs. In an unpublished letter to Strachey (dated January 22, 1965), Eissler suggests that this should have been translated literally as 'the **establishment** of the superego' rather than 'the **hypothesis** of the superego'. Eissler remarks that it is doubtful that Freud would have described the superego as a hypothesis. His intended meaning is, however, not entirely clear. A literal translation of *Aufstellung* is '**setting up**'. In the present context, it could denote 'establishment', but it could also denote a range of subtly different things, from '**installation**' and '**arrangement**' to '**placement**'. Furthermore, while it could denote the setting up (etc.) of the superego, it could equally denote the setting up of the concept of the superego. Strachey seems to have opted for the latter meaning.

p. 71 *n*. 2:
'*Wo Es war, soll Ich werden*.' Lacan (1956, 128) was the first to point out that a syntactically correct rendition of this celebrated formula would have been 'where id was, ego shall **become**'. Various similar renditions have been suggested by other authors (e.g. Shapiro in Habermas, 1971, 344 *n*. 31; Laplanche & Pontalis, 1973, 142 *n*.; Bettelheim, 1983, 61).

Mahony (1992*a*, 32) notes in addition that Freud accentuated the phrase in the German original by increased spacing between the words. The silent omission of Freud's italics and other forms of emphasis was a common practice of Strachey's (Ornston, 1992) but in this instance Mahony is mistaken; the text is, in fact, not measurably expanded in the German original (see *GW*, **15**, 86).

p. 89, line 13:
Kotsäule. Ragg-Kirkby (2003, 171 *n*. 14) comments that Freud 'coins an extraordinary neologism here'. However, the term (and its English equivalent, **faecal column**) is frequently used in medicine. It has to be said that Adam Phillips, the general editor of the *PMC* collection of Freud's writings, made a virtue of using non-specialist translators (Phillips, 2007).

p. 263, lines 5–6:
mich . . . heimsucht. Bettelheim (1983, x) and Mahony (1984*b*, 858) argue that this phrase should have been translated as '**visited me**' rather than '**troubled me**'. However, it should be emphasized that *Heimsuchung* is distressing.

VOLUME XXIII

p. 132, line 15:
Selbstbehauptung. Brull (1975, 277) points out that, whereas Strachey translates '[the ego] has the task of **self-preservation**', Freud had actually used the word *Selbstbehauptung*, which means, literally, '**self-assertion**'. Alix Strachey (1943, 62) suggests this rendition of the term in her *New German–English Psycho-Analytical Vocabulary*, along with '**maintenance of the self**' and '**self-maintenance**'. The point at issue here is that *Selbstbehauptung* is an effortful struggle.

p. 134, line 10:
Bedürfnisspannungen. Literally translated, this reads '**need-tensions**', whereas Strachey renders it as '**tensions caused by the needs** of the id'. Mahony (1992*a*, 37) writes: 'Freud is not saying that there is a cause-and-effect relationship between id needs and tensions; rather, the id needs in themselves constitute one kind of tension.' The point at issue here is that tension inheres in id needs.

p. 134, line 10 f.b.:
Ichliebe. Freud contrasts this term with *Objektliebe* ('object love'). Kernberg (1982, 894) feels that Strachey's translation of the former term as 'ego-love' obscures the simple contrast between '**self-love**' and 'object love'. (See p. 69 above.)

p. 156, line 8:
Das kranke Ich. Kernberg (1982, 894–5) opines that, although Strachey's translation of this phrase ('the sick **ego**') maintains the consistency of the metapsychological concept, it does not do justice to the original German which 'clearly refers to the whole **self**'. The penultimate sentence of this paragraph, though, seems to contradict Kernberg's reading.

p. 195, heading:
endliche . . . unendliche. Holder (1988, 211) argues that the title of this work should be '**Finite and Infinite Analysis**' rather than 'Analysis **Terminable** and **Interminable**'. See also Mahony (1989, 74–6, 83 *n*. 12) and Leupold-Löwenthal (1991, 68–73). It should be mentioned that the loose translation of this title was made by Riviere, long before publication of the *SE*.

p. 195, line 4:
eine langwierige Arbeit. Junker (1992, 54) is of the opinion that this phrase (which Strachey translates as a '**time-consuming** business') would be better translated as '**tedious** work' or '**wearisome** work'. According to Grubrich-Simitis (1995), the phrase could be translated in many different ways. What is at stake in Freud's choice of words here is the question as to whether the length and laboriousness of psychoanalytic treatment is really necessary and worth so much effort.

p. 197, line 10:
Wohlbefinden. Junker (1992, 56) believes that this word should have been translated as '**ease and comfort**', rather than 'good state of **health**'. Junker argues that the latter rendition has a more restricted meaning than the original. What is at issue, it seems, is the fact that a psychiatric patient's *Befindlichkeit* is determined by their own subjective assessment.

p. 198, line 3:
Takt. Mahony (1992*a*, 32) points out that the German word *Takt* has somewhat broader connotations than its English equivalent '**tact**'; it can refer also to (musical) timing and measure. (See also Mahony, 1989, 75.) The point here is that Freud is speaking not only of the analyst's tact in making the intervention but also of the timing of the intervention.

p. 221, line 4:
wiederfand. Mahony (1992*a*, 43) argues that this sentence should actually read: 'Not long ago I **again** came upon this theory of mine . . .'. He speculates that the ambiguous phrasing might indicate that Freud was familiar with Empedocles's 'instinct theory' before he developed his own. The phrasing is not that ambiguous, though; it says merely that Freud **re-found** his own thinking in the writings of Empedocles.

p. 223, line 18:
durchwegs. Mahony (1989, 83 *n*. 12) argues that this word should have been translated as '**thoroughly**' rather than '**invariably**', which implies a subtle shift of meaning. Grubrich-Simitis (1995) points out that this is a matter of interpretation; 'invariably' is certainly not incorrect.

p. 251, line 15 f.b.:
kniffige. Hinz (1995, 330) emotively asserts that Strachey's translation of this word (which literally means **crafty** or **tricky**) as **artful** is itself 'an example of perverse glossing over and idealization, i.e., a confusion of fetish formation and art'. Hinz is evidently reading 'artful' as 'artistic', but Strachey meant it in the sense of Charles Dickens's character the Artful Dodger.

BIBLIOGRAPHIES

BIBLIOGRAPHIES

EDITOR'S INTRODUCTION

The Bibliographies in this volume are based on the separate Bibliographies to be found in the other twenty-three volumes of the *Revised Standard Edition*, and in general the same principles applied in those volumes have been followed here. However, the individual Bibliographies have not been merely collated; the opportunity has been taken to divide the whole into two sections: (A) Freud Bibliography and (B) Bibliography Excluding Freud. The purpose of the Freud Bibliography is such that its contents far exceed those to be found in the individual volumes, as will be explained below.

For both Bibliographies, titles of books and journals are in italics; titles of papers are in single inverted commas. Abbreviations for the titles of journals are, for the Freud Bibliography, in accordance with the *Periodica medica: Titelabkürzungen medizinischer Zeitschriften*, 4th ed., Stuttgart (1952), and, for the Bibliography Excluding Freud, in accordance with the *World List of Scientific Periodicals*, 3rd ed., London (1952), and 4th ed., London (1963–5), extrapolated forwards. (Certain abbreviations differ slightly in the form they appear in these two reference lists; this is the source of small inconsistencies here.) Other abbreviations, used only in the Freud Bibliography, are listed on p. 27 above. Numerals in bold type refer to volumes; ordinary numerals (unless otherwise specified) refer to page numbers, and ordinary numerals in round brackets refer to journal issue numbers – which are provided only where clarification is considered necessary.

Freud Bibliography

This is intended to be a complete list of Freud's published writings (as at November 2013).[1] It includes many works that do not actually appear in the *RSE* (e.g. Freud's neuroscientific works) and writings that were not published in Freud's lifetime (e.g. letters), most of which are not even referenced in the individual volumes of the *RSE*. The Freud Bibliography is therefore very much larger than the combined Freud entries contained in the Bibliographies of the other twenty-three volumes, and it is far more comprehensive than its equivalent in *SE*, **24**. This is due not only to the ongoing posthumous publication of Freud's letters – as well as drafts, notes, diaries, and the like (even fragments) – but also to the fact that large numbers of Freud's earliest publications were unknown to the Editors of the *SE* when its final volume appeared in 1974. This applies especially to the numerous reviews of the

1 There is an unavoidable lag in capturing recent publications; see below. At the time of going to press, it was thought necessary to make only three exceptions to this cut-off date: Freud (2015*a*, 2019*a*, 2024*a*).

neuroscientific literature that Freud published in the 1880s. Thus, whereas the Freud Bibliography in the *SE* listed 368 entries (of which 310 were published during Freud's lifetime), this revised edition lists 1,736 entries (of which 687 were published during Freud's lifetime). The disparities are enormous.

Although the *SE* Freud Bibliography (compiled by Angela Richards) forms the basis of the present version, it would be more accurate to say that it is an edited translation into English (by Mark Solms) of the *Freud Bibliographie mit Werkkonkordanz* compiled (in two published editions) by Ingeborg Meyer-Palmedo (S. Fischer Verlag, 1989) and Ingeborg Meyer-Palmedo & Gerhard Fichtner (S. Fischer Verlag, 1999), and (privately, on an ongoing basis since then) by Gerhard Fichtner – until his death in 2011 – in collaboration with Albrecht Hirschmüller, who still continues this work. Although these German scholars generously acknowledged the meritorious efforts of Angela Richards (who in turn acknowledged her predecessors, Alan Tyson and James Strachey), and although they justly describe her Freud Bibliography as 'the nucleus' of their German version, the relative numbers cited above indicate the extent of their own contributions in creating and maintaining a truly comprehensive bibliography of Freud's published writings. For permission to draw upon the vast amount of material they have documented since 1974, we are grateful not only to these colleagues themselves, but also to S. Fischer Verlag (Frankfurt), by arrangement with whom the continuation of a decades-long collaboration between the authorized editors of Freud's works in German and English is made possible.

The other substantial difference between the present (*RSE*) Freud Bibliography and the earlier (*SE*) version is the separation of the index of bibliographic citations from the bibliography itself. This change (which was made also in the Bibliography Excluding Freud) is consistent with current practice, and it makes the greatly expanded bibliographies less bulky than they otherwise would have been. Searches for citations of individual authors' works can now be made via the Index of Names.

The arrangement of Freud's writings throughout the Freud Bibliography is chronological, by year of first publication. Within each year, however, the entries are not necessarily chronological; they are numbered by means of a distinguishing letter in italicized lower case. Where the year of writing is known to differ from the year of publication, the former is added in square brackets, thus: '(1955*c* [1920])' indicates a work written in 1920 but first published in 1955. Please note: the dates attributed to some individual works in this edition vary from those in the *SE*, on the basis of new scholarship. In all such cases, the old entry is listed with a cross-reference to the new one, thus: '(1890*a*) Now under (1905*b* [ca. 1894/95])'.

In the case of Freud's letters, the dates of publication frequently entail complications, such as the fact that different extracts from the same letter may have been published at different times, and that it may have first been published individually and then published in a selection of letters to various correspondents or a collection of letters to the same correspondent. In such instances we have typically listed the letters in multiple entries (with cross-references) – but not always. Specifically, the many letters (or extracts from letters) first published in Ernest Jones's (1953, 1955, 1957) three-volume biography of Freud, which were subsequently included in collected editions of Freud's letters, are not all dated 1953, 1955 and 1957, respectively. The same applies to the large selection of letters that was first published in volume form

by Ernst Freud in 1960. In these instances, the date of appearance of the complete letters to each correspondent seemed more appropriately to qualify as the date of publication. The date (*1960a*) is thus used only to signify the publication of *that particular selection* of letters. However, other selections of Freud's letters are not all given their own dates. For example, the compilation of images and texts published in 1976 under the editorship of Ernst and Lucie Freud and Ilse Grubrich-Simitis is only cited in relation to the *individual* letters (and other bits of text) that were first published in that volume. Additional problems arise with Freud's numerous handwritten notes and drafts of his works, many extracts from which were published by Ilse Grubrich-Simitis (1993) in her masterly study of his manuscripts. The bibliographic details of these fragments are here incorporated mainly into the entries for the published works to which they correspond, rather than dated 1993, and only those which *stand alone* are dated so. All such complications are laid bare in the cross-references and editorial notes in the Freud Bibliography itself.

In instances where the first edition of a particular work has not been accessible, or where the bibliographic details provided are unreliable for any other reason, a cautionary asterisk (*) is added at the end of the entry. Similarly, Freud's authorship of some of the works remains uncertain. Although we have included only those works that may reasonably be attributed to Freud, doubtful instances are indicated in square brackets. Second-hand reports (mainly of lectures by Freud) are included only in exceptional cases, and are always identified as such.

The present Freud Bibliography is now the most complete one in print. However, it will always remain a work in progress, subject to ongoing updating and revision. Most likely, the task of maintaining it (which is currently being performed by Hirschmüller) will eventually be transferred to an electronic publication platform. However, it must be said that, with the rapid shift in publishing from printed to electronic formats, it is becoming increasingly difficult to keep abreast of the publication of Freud's writings. This applies especially to individual letters and other bits of writing that are posted in online catalogues – usually (but not exclusively) by auction houses. In these circumstances, and given the increasingly uncertain meaning of the word 'publication', the very idea of a comprehensive bibliography will perhaps someday lose its premise.

With that said, in the standardized Freud Bibliography published here, references are given as follows:

For the German or other original text: to the original publication and to the *Gesammelte Werke* or (where possible, and especially where the work is not included in the *GW*) to some other accessible source. References to the *Gesammelte Schriften* and *Studienausgabe* and other editions of the work – including major editions – are given only where relevant (e.g. when they constitute the first publication or include a revised version of the work).

For the text of the English translation: references are given to the *RSE* and *NSW* or (where the work does not appear in these collected editions) to some other accessible English translation. In the case of those few neuroscientific works that are currently available in English translation, the existing reference is given in addition to the *NSW* reference, for the reason that the *NSW* translations are not yet in print at the time of publication of the *RSE*.

Fuller bibliographic details than these – for example, giving particulars of all editions of the original text up to the date of Freud's death, and of all *GW* and *SA* and other major German editions thereafter – are not provided in this Bibliography. These details can be found at the beginning of the editorial matter that precedes each individual work in the preceding twenty-three volumes of this edition, and in the forthcoming *NSW*. (In this respect, the present Freud Bibliography differs significantly from the stand-alone *Freud Bibliographie mit Werkkonkordanz*.) The same applies to bibliographic details of the English translations: references to translations published up to the date of Freud's death, including the *Collected Papers* and *SE* and other major editions thereafter, can be found at the beginning of the editorial matter that precedes each individual work – but not in this Bibliography. The purpose of this *RSE* Freud Bibliography is not to provide comprehensive bibliographic details of all Freud's writings, but rather to provide a comprehensive *listing* of his published writings, giving the date and place of *first* publication of each item, and references to the *currently most authoritative edition* of these works in German and in English translation.

The lists (both in this Freud Bibliography and in the Editorial Introductions and Notes to the individual texts) contain English translations only. Particulars of translations into other languages are given in Alexander Grinstein's *Index of Psychoanalytic Writings* (1956–75) and in his *Sigmund Freud's Writings* (1977). Nothing equivalent to Grinstein's indexes has appeared in recent decades, but collected editions of Freud's psychological works are now available in almost all major languages.

Bibliography Excluding Freud

This Bibliography is intended to list all *other* technical publications referred to either in Freud's own texts or in the editorial commentaries. It therefore differs from the *SE* version mainly by the addition of references contained in the newly discovered Freud texts and in the updated editorial apparatus. The only other substantial difference between this edition and the *SE* version is the separation of the index of bibliographic citations from the bibliography itself, as described above. The list of references to the works of technical authors other than Freud is supplemented by a revised version of the *SE*'s 'Index of Personal Names' – which now provides a single, integrated 'Index of Names', including both technical and non-technical authors, and non-authors. This undifferentiated listing of names cited in the text is consistent with contemporary practice.

As with the Freud Bibliography, for each author in this 'Bibliography Excluding Freud' the arrangement is by year of publication, and within each year by a distinguishing italicized letter. Normally the year will be that of first publication. Where reference is intended to an edition other than the first one, this is indicated.

The distinguishing letter used in this combined bibliography is used also in the shorter bibliographies in the individual volumes of the *RSE*, even in instances where year of publication alone may have sufficed, due to the smaller number of entries. This change from the policy followed in the *SE* Bibliography is made for the sake of consistent cross-referencing across all volumes. (It will be recalled that *SE*, **24** was compiled some years after the publication of the other twenty-three volumes.)

English translations of foreign works included in this Bibliography have been added wherever it was possible to trace accessible editions. In the case of Jung (who made extensive alterations in the later editions of his published works), the translations cited are of the versions of the German texts that were available to Freud.

Works contained in 'Bibliography B' of *The Interpretation of Dreams* are not included here. That bibliography was a reading list prepared by Freud, comprising works on dreams published before 1900, to which no reference was made in his actual text. (See *RSE*, **5**, 634–8, for this list.)

Acknowledgements

In addition to the enormous scholarly assistance I received over the years from Ingeborg Meyer-Palmedo and Gerhard Fichtner, and more recently from Albrecht Hirschmüller, I cannot acknowledge enough the technical assistance I received from Mary Tobin, and to a lesser extent from my research assistant Natasha Jooste, with these Bibliographies and Indexes (the compiling and editing of which was an excruciating task).

Freud's writing desk at 20 Maresfield Gardens

Freud's writing desk at 20 Maresfield Gardens

In a letter to Max Eitingon dated October 12, 1919, Freud wrote: 'My two brothers already rest in English soil; perhaps I shall also find room there.'

Section (C) 'Die okkulte Bedeutung des Traumes' published simultaneously in *Imago*, **11** (1925), 234–8, *Almanach der Psychoanalyse* (1926), 27–31, and *Pester Lloyd*, **72**, No. 201, September 8, 1925 (Morgenbl.), 9. *GW*, **1**, 561–73.
[*Trans.*: 'Some Additional Notes on Dream Interpretation as a Whole', *RSE*, **19**, 115–26.]
(1925*j*) 'Einige psychische Folgen des anatomischen Geschlechtsunterschieds', *Internat. Zschr. Psychoanal.*, **11**, 401–10. *GW*, **14**, 19–30.
[*Trans.*: 'Some Psychical Consequences of the Anatomical Distinction between the Sexes', *RSE*, **19**, 249–58.]

(1925*k*) Letter to André Gaucher (June 10, 1925). [Partially reprinted in] 'Professor Freud über Leon Daudet', *Der Tag* (Vienna), June 28, 1925, p. 7. [Complete in French trans. in (1925*o*).]

(1925*l*) Interview by Friedrich Porges: 'Professor Freud macht keinen Seelenfilm. Eine Abfuhr des Filmmagnaten Mister Goldwyn', *Die Stunde* (Vienna), No. 564, January 24, 1925, p. 3.

(1925*m*) Letter to the Editor [comment on a film about psychoanalysis], *Neue Freie Presse*, August 25, 1925, p. 11.

(1925*n*) Letter to the *Prager Tagblatt* [comment on Mussolini], 'Wie sie Mussolini sehen', *Prager Tagblatt*, **50**, No. 300, December 25, 1925, pp. 17–18.

(1925*o*) [previously (1980*u* [1925])] Two letters to André Gaucher. [First published in French trans., the first letter only partially] in A. Gaucher, *L'obsédé, Drame de la libido*, Paris, xiv and 'Postface'. Reprinted in S. Cottet & A. L. Le Breton, 'Sigmund Freud, deux lettres méconnues', *Ornicar?*, No. 20/21 (1980), 85–92; the letters pp. 90–2. [The second letter (June 10, 1925) partially reprinted in the original German under (1925*k*).]

(1926*a*) 'An Romain Rolland' [Letter on his 60th birthday, January 29, 1926)], *Liber amicorum Romain Rolland*, Zürich and Leipzig, 152. Preprint in 'Dichter und Denker über Romain Rolland', *Neue Freie Presse*, January 24, 1926 (Morgenbl.), Suppl., 29–30. [Included in (1960*a*) and (1993*i*).] *GW*, **14**, 553.
[*Trans.*: 'To Romain Rolland', *RSE*, **20**, 264.]

(1926*b*) 'Karl Abraham †', *Internat. Zschr. Psychoanal.*, **12**, 1–2. *GW*, **14**, 564.
[*Trans.*: 'Karl Abraham', *RSE*, **20**, 263.]

(1926*c*) Note on E. Pickworth Farrow, 'Eine Kindheitserinnerung aus dem 6. Lebensmonat', *Internat. Zschr. Psychoanal.*, **12**, 79–84; the note p. 79. *GW*, **14**, 568.
[*Trans.*: Prefatory Note to a Paper by E. Pickworth Farrow, *RSE*, **20**, 265.]

(1926*d* [1925]) *Hemmung, Symptom und Angst*, Vienna. Preprint of Chapter I in *Neue Freie Presse*, February 21, 1926 (Morgenbl.), 12. *GW*, **14**, 113–205.
[*Trans.*: *Inhibitions, Symptoms and Anxiety*, *RSE*, **20**, 77–152.]

(1926*e*) *Die Frage der Laienanalyse. Unterredungen mit einem Unparteiischen*, Vienna. Extract published under the title 'Aus der Werkstatt des Psychoanalytikers' in *Neue Freie Presse*, September 22, 1926, p. 7, and under the title 'Psychoanalyse und Kurpfuscherei' in *Almanach [der Psychoanalyse] für das Jahr 1927*, Vienna (1926), 47–59. ['Nachwort zur *Frage der Laienanalyse*' under (1927*a*); 'Ankündigung' for this publication (1926*i*).] Suppressed passage from 1927 'Nachwort' published in I. Grubrich-Simitis, *Zurück zu Freuds Texten. Stumme Dokumente sprechen machen*, Frankfurt (1993), 226–9; 'Nachschrift' and Addenda for a planned but never realized 1935 English ed., ibid., **294**–5, 297–301. *GW*, **14**, 209–86.
[*Trans.*: *The Question of Lay Analysis: Conversations with an Impartial Person* (including all supplementary material), *RSE*, **20**, 163–242.]

(1926*f* [1925]) 'Psychoanalysis: Freudian School' [in English], *Encyclopaedia Britannica*, 13th ed. (five new vols.), **3**, London, 253–5. German original first published under the title 'Psycho-Analysis' in the *Gesammelte Schriften* (1934), **12**, 372–80. *GW*, **14**, 299–307.
[*Trans.*: 'Psychoanalysis', *RSE*, **20**, 247–54.]

(1926*g*) Translation of Part I, Section 13, of I. Levine, *The Unconscious*, with supplementary footnote ('Anmerkung über Ewald Hering'), under the title *Das*

Unbewußte, Vienna [the remainder of the book was translated by Anna Freud]; the footnote pp. 34–5. *GW*, **Nachtr.**, 770–1.
[*Trans.*: Footnote on Hering [the footnote only], incorporated in (1915*e*), *RSE*, **14**, 181–2.]

(1926*h*) Letter to Fernand Divoire (April 19, 1926) [in German with French trans.], *Au-delà de l'amour*, Paris (*Les cahiers contemporains*, **3**), 77–8.
[*Trans.*: In T. Reik, *From Thirty Years with Freud*, New York and Toronto (1940), 176, and in T. Reik, *The Search Within: The Inner Experiences of a Psychoanalyst*, New York (1956), 76.]

(1926*i*) 'Dr Reik und die Kurpfuschereifrage', Letter to the *Neue Freie Presse*, July 18, 1926, p. 12. [Included in (1926*e*).] *GW*, **Nachtr.**, 715–17.
[*Trans.*: 'Dr Reik and the Problem of Quackery', incorporated in (1926*e*), *RSE*, **20**, 241–2.]

(1926*j*) [previously (1941*e* [1926])] Ansprache an die Mitglieder des Vereins B'nai B'rith [Letter to Salomon Ehrmann], *B'nai B'rith Mitteilungen für Österreich*, **26** (5), 103–5. [Included in (1960*a*).] *GW*, **17**, 51–3.
[*Trans.*: Address to the Society of B'nai B'rith, *RSE*, **20**, 259–60.]

(1926*k*) Unser Orden [Letter to Friedrich Thieberger (January 27, 1926), facsimile], *B'nai B'rith Mitteilungen für Österreich*, **26** (5), 135. Also in *Menorah*, **4**, H. 5 (May, 1926), 256, and 'B'nai B'rith Monatsblätter der Großloge für den tschechoslowakischen Staat' (1926). Reprinted in G. Fichtner '"Als ob" es Freud wäre . . . Ein angebliches Freud-Gedicht und sein Zusammenhang mit Freuds Menschenbild', *Jb. Psychoanal.*, **33** (1994), 49–71; the facsimile p. 52.

(1926*l*) (With FREUD, A. & REIK, T.) German trans. of E. Jones, 'Karl Abraham, 1877–1925' (*Internat. J. Psycho-Anal.*, **7**, 1926). Under the title 'Karl Abraham, 1877–1925', *Internat. Zschr. Psychoanal.*, **12** (1926), 155–83.

(1926*m*) Letter to Yvette Guilbert (May 10, 1926), in 'Professor Freud über seine Unsterblichkeit. Ein Brief Freuds an Yvette Guilbert', *Die Stunde (Wien)*, **4**, No. 959, May 21, 1926, p. 7.

(1926*n*) Appeal for a Popper-Lynkeus monument (November 10, 1926), in *Vossische Zeitung*, No. 532 (A 269) morning edition, supplement: Das Unterhaltungsblatt, No. 264, p. 3 [signed but not authored by Freud].

(1926*o*) Appeal for a Popper-Lynkeus monument (November 14, 1926), in *Neue Freie Presse*, No. 22.331 (morning edition, p. 12). [Signed but not authored by Freud.]

(1927*a*) 'Nachwort zur *Frage der Laienanalyse*', *Internat. Zschr. Psychoanal.*, **13**, 326–32. *GW*, **14**, 287–96.
[*Trans.*: 'Postscript 1927', included in (1926*e*), with suppressed portion, *RSE*, **20**, 224–31.]

(1927*b*) 'Nachtrag zur Arbeit über den Moses des Michelangelo', *Imago*, **13**, 552–3. First published in French trans. under the title 'Appendice', *Rev. franç. psychanal.*, **1**, 147–8. *GW*, **14**, 321–2.
[*Trans.*: 'Postscript 1927', included in (1914*b*), *RSE*, **13**, 229.]

(1927*c*) *Die Zukunft einer Illusion*, Vienna. *GW*, **14**, 325–80.
[*Trans.*: *The Future of an Illusion*, *RSE*, **21**, 5–52.]

(1932*f* [1929]) Letter to George Lawton (December 20, 1929). [In English; partially reprinted] in G. Lawton, *The Drama of Life after Death. A Study of the Spiritualist Religion*, New York, 1932 (*Studies in Religion and Culture, American Religion Series* **6**), 563. Also partially reprinted in E. Jones, *Sigmund Freud: Life and Work*, **3**, London (1957), 419–20; German trans. in E. Jones, *Das Leben und Werk von Sigmund Freud*, **3**, Bern (1962), 456 *n*.

(1932*g*) Interview by Nicolas Bandy, 'Neurosen als Zeitkrankheit. Welche Heilerfolge hat die Psychoanalyse? (Aus einem Gespräch.)', *Neue Freie Presse*, No. 24.397, August 14, 1932 (Morgenbl.), Suppl., 21. Extracts reprinted in *Die Presse*, No. 10.320, August 14/15, 1982.

(1932*h*) Interview by Nicolas Bandy ('Vu chez le professeur Freud'), in *Vu*, **5**, No. 227, July 20, 1932, pp. 1177–9. Reprinted in *Le bloc-notes de la psychanalyse*, No. 5 (1985), 153–5.

(1932*i*) Letter to the Editor of the *Neue Freie Presse*, *Neue Freie Presse*, August 18, 1932, p. 6.

(1932*j* [1930]) Now under (1930*l*).

(1932*k*) Call for a World Congress Against War (Barbusse), in *Freiheit* (Düsseldorf), **15**, No. 178, August 10, 1932, p. 4 [signed but not authored by Freud].

(1932*l*) Interview: 'Karáczonyi beszélgetés Ausztria két leghíresebb emberével. Freud professzor a pszichoanalízis megalapítója, és Wagner Jauregg professzor, a paralízis-gyógyító maláriaoltás Nobel-díjas feltalálója nyilatkoznak a Magyar Hírlap bécsi tudósitójának' ('Christmas discussion with the two most famous men in Austria: Professor Freud, founder of psychoanalysis, and Nobel Laureate Professor Wagner Jauregg, discoverer of the malaria vaccination for paralysis, give the Vienna correspondent of *Magyar Hírlap* an interview') [in Hungarian], in *Magyar Hírlap*, **42**, No. 291, December 25, 1932, pp. 9–10.

(1933*a* [1932]) *Neue Folge der Vorlesungen zur Einführung in die Psychoanalyse*, Vienna. [The *Vorlesungen* under (1916–17*a*).] Preprint 'Das Über-Ich' in *Vossische Zeitung*, No. 581, December 4, 1932, Morgenausg., Unterhaltungsbl. No. 337, p. 1. A summary of Lecture XXX (in Hungarian) appeared before [cf. (1932*d*)]; reprint of an extract from this lecture under the title 'Zum Problem der Telepathie' in *Almanach der Psychoanalyse 1935*, Vienna (1934), pp. 9–34; not to be confused with (1941*d*). [Variants of the drawing of Freud's structural model of the mind published in I. Grubrich-Simitis, *Zurück zu Freuds Texten. Stumme Dokumente sprechen machen*, Frankfurt (1993), 201.] *GW*, **15**.
[*Trans.*: *New Introductory Lectures on Psychoanalysis*, *RSE*, **22**, 5–160. (The variants of the drawing in I. Grubrich-Simitis, *Back to Freud's Texts. Making Silent Documents Speak*, New Haven and London (1996), 156.)]

(1933*b* [1932]) *Warum Krieg?* [Letter to Albert Einstein (September, 1932)], in *Warum Krieg? Pourquoi la guerre? Why War?*, tri-language ed., Institut International de Coopération Intellectuelle, Paris (Correspondence; Open Letters, vol. **2**), 25–62. *GW*, **16**, 13–27.
[*Trans.*: *Why War?*, *RSE*, **22**, 211–25.]

(1933*c*) 'Sándor Ferenczi †', *Internat. Zschr. Psychoanal.*, **19**, 301–4. [Variants published in I. Grubrich-Simitis, *Zurück zu Freuds Texten. Stumme Dokumente sprechen machen*, Frankfurt (1993), 218–19.] *GW*, **16**, 267–9.
[*Trans.*: 'Sándor Ferenczi', *RSE*, **22**, 241–3. (The variants in I. Grubrich-Simitis, *Back to Freud's Texts. Making Silent Documents Speak*, New Haven and London (1996), 171–3).]

(1933*d*) Preface [in French trans. ('Avant-Propos')] to M. Bonaparte, *Edgar Poe, étude psychanalytique*, Paris, **1**, xi. The German original (without title) in M. Bonaparte, *Edgar Poe, eine psychoanalytische Studie*, Vienna (1934), v. *GW*, **16**, 276.

[*Trans.*: Preface to Marie Bonaparte's *The Life and Works of Edgar Allan Poe: A Psycho-Analytic Interpretation*, *RSE*, **22**, 268.]

(1933*e* [1932]) Three letters to André Breton (December 13, 14 and 26, 1932) [in French trans. with facsimile of the German letter of 26th], in *Le surréalisme au service de la révolution* (1933), No. 5, pp. 10–11.

[*Trans.*: F. B. Davis, 'Three Letters from Sigmund Freud to André Breton', *J. Amer. Psychoanal. Ass.*, **21** (1973), 127–34.]

(1933*f* [1932]) Letter to Siegfried Hessing (July 9, 1932), in S. Hessing, ed., *Spinoza-Festschrift*, Heidelberg, 1933, pp. 221–2. (2nd ed. Den Haag, 1962, pp. 196–7.) *GW*, **Nachtr.**, 670.

[*Trans.*: Incorporated in (1955*e*).]

(1934*a* [1930]) 'Vorrede' [in Hebrew trans.] to *Vorlesungen zur Einführung in die Psychoanalyse* (1916–17*a*) [Hebrew ed.], Jerusalem, 1934. The German original appeared simultaneously in the *Gesammelte Schriften*, **12**, 383–4. *GW*, **16**, 274–5.

[*Trans.*: Preface to the Hebrew Translation, included in (1916–17*a*), *RSE*, **15**, 9–10.]

(1934*b* [1930]) 'Vorrede' [in Hebrew trans.] to *Totem und Tabu* (1912–13*a*) [Hebrew ed.], Jerusalem, 1939. The German original appeared simultaneously in the *Gesammelte Schriften*, **12**, 385. *GW*, **14**, 569.

[*Trans.*: Preface to the Hebrew Translation, included in (1912–13*a*), *RSE*, **13**, 9.]

(1934*c* [1933]) 'Introductory Note' [in English trans.] to W. Sachs, *Psychoanalysis: Its Meaning and Practical Applications*, London, v.

[Introductory Note to Sachs's *Psychoanalysis: Its Meaning and Practical Applications*, *RSE*, **22**, 269.]

(1934*d* [1929]) Letter to Julio Pires Porto-Carrero (May 13, 1929), in J. P. Porto-Carrero, *Ensaios de psicanálise*, 2nd ed., Rio de Janeiro, 5–6.

(1934*e*) Letter to Raúl Carrancá y Trujillo (February 13, 1934), in *Criminalia*, No. 8 (April), 160. Reprinted in R. Gallo, *Freud's Mexico: Into the Wilds of Psychoanalysis*, Cambridge, MA (2010), 209–10. [German text, English trans., facsimile.]

(1935*a*) 'Nachschrift 1935. Nachtrag zur Selbstdarstellung' [(1925*d*)]. The text appeared first in English trans. under the title 'Postscript 1935' [in 'An Autobiographical Study'] in *Autobiography*, New York and London, 1935 (a new ed. of *The Problem of Lay Analysis*, New York, 1927). The German text was first published later in 1935 in *Almanach der Psychoanalyse 1936*, Vienna, 9–14, and in 1936 in the 2nd ed. of the *Selbstdarstellung* [with addenda and supplementary footnotes, under (1935*d*)], Leipzig, Vienna and Zürich, 102–7. *GW*, **16**, 31–4.

[*Trans.*: Postscript 1935, included in (1925*d*), *RSE*, **20**, 63–6.]

(1935*b*) 'Die Feinheit einer Fehlhandlung', in *Almanach der Psychoanalyse 1936*, Vienna (1935), 15–17. *GW*, **16**, 37–9.

[*Trans.*: 'The Subtleties of a Faulty Action', *RSE*, **22**, 249–50.]

(1935*c*) Thomas Mann zum 60. Geburtstag [Letter (April, 1935)], in *Almanach der Psychoanalyse 1936*, Vienna (1935), 18. Reprinted (dated June 6, 1935) in 'Sigm. Freud – Drei Briefe', *Almanach [of S. Fischer Verlag]. Das dreiundsiebzigste Jahr*, Frankfurt (1959), 34–7; the letter pp. 34, 36. [Included in (1960*a*) and (1988*g*).] *GW*, **16**, 249.

[*Trans.*: 'To Thomas Mann on his Sixtieth Birthday', *RSE*, **22**, 272.]

(1935*d*) Postscript to the *Selbstdarstellung* (1925*d*). First appeared in English trans. in S. Freud, *Autobiography*, New York and London (1935) [cf. (1935*a*)]. The German

original appeared in 1936 in the 2nd ed. of the *Selbstdarstellung*, Leipzig, Vienna and Zürich. *GW*, **Nachtr.**, 763–4.
[*Trans.*: 'Postscript 1935', included in (1925*d*), *RSE*, **20**, 63–6.]

(1935*e*) Brief an B'nai B'rith (Wien), *B'nai B'rith Mitteilungen für Österreich*, **35** (9/10), 193. Reprinted in B. Nitzschke, 'Freuds Vortrag vor dem Israelitischen Humanitätsverein "Wien" des Ordens B'nai B'rith: Wir und der Tod (1915)', *Psyche*, **45** (1991), 97–131; the letter pp. 102–3.
[*Trans.*: Letter to the Society of B'nai B'rith, Vienna, *RSE*, **22**, 273–4.]

(1935*f*) Unbesiegbarer Lebenswille. Glückwunsch zur Fünfzehnjahrfeier des Keren Hajessod (Palästina-Aufbaufonds), *Die Stimme (Vienna)*, **9**, No. 500, November 19, 1935, p. 9. [Partial reprint of a letter to L. Jaffe, dated June 20, 1935.]
[*Trans.*: In R. Klingsberg, ed., *Freudiana: From the Collections of the Jewish National and University Library, exhibited in The Berman Hall of the Library, March 28th – April 13th, 1973*, Jerusalem (1973), ix.]

(1936*a*) 'Eine Erinnerungsstörung auf der Akropolis' (Letter to Romain Rolland; January 29, 1936), in *Almanach der Psychoanalyse 1937*, Vienna (1936), 9–21. [Included in (1993*i*); cf. (1991*k*).] *GW*, **16**, 250–7.
[*Trans.*: 'A Disturbance of Memory on the Acropolis', *RSE*, **22**, 255–63.]

(1936*b* [1932]) 'Vorwort' (letter of July 3, 1932) to R. Sterba, *Handwörterbuch der Psychoanalyse*, Vienna, 3 [as facsimile]. *GW*, **Nachtr.**, 761.
[*Trans.*: Preface to Richard Sterba's *Dictionary of Psychoanalysis*, *RSE*, **22**, 267.]

(1936*c* [1935]) Preface [in Czech trans.] to *Vorlesungen zur Einführung in die Psychoanalyse* (1916–17*a*) [Czech ed.], Prague. *GW*, **Nachtr.**, 748 [German reverse trans.].
[*Trans.*: Preface to the Czech Translation, included in (1916–17*a*), *RSE*, **15**, 11.]

(1936*d*) 'Zum Ableben Professor Brauns', *Mitteilungsblatt der Vereinigung jüdischer Ärzte*, No. 29, p. 6. *GW*, **Nachtr.**, 735.
[*Trans.*: 'Death of Professor Braun', *RSE*, **22**, 275.]

(1936*e*) Interview by Odette Pannetier: 'Visite au Professeur Freud. Je me fais psychanalyser', *Candide*, **13**, No. 645, July 23, 1936.
[*Trans.*: 'Appointment in Vienna', *The Living Age* (New York), **351**, No. 4441, October, 1936, pp. 138–44.]

(1936–38*a*) Preface [in Yiddish trans.] to *Vorlesungen zur Einführung in die Psychoanalyse* (1916–17*a*) [Yiddish ed.], Vilnius, 1936–38.
[*Trans.*: Preface to the Yiddish Translation, included in (1916–17*a*), *RSE*, **15**, 12.]

(1937*a*) 'Lou Andreas-Salomé †', *Internat. Zschr. Psychoanal.*, **23**, 5. *GW*, **16**, 270.
[*Trans.*: 'Lou Andreas-Salomé', *RSE*, **23**, 271–2.]

(1937*b*) 'Moses ein Ägypter', *Imago*, **23**, 5–13. [Included in (1939*a*).] *GW*, **16**, 103–13.
[*Trans.*: 'Moses an Egyptian', included in (1939*a*), *RSE*, **23**, 9–17.]

[Variants published in I. Grubrich-Simitis, *Zurück zu Freuds Texten. Stumme Dokumente sprechen machen*, Frankfurt (1993), 220.] *GW*, **16**, 59–99.
[*Trans.*: 'Analysis Terminable and Interminable', *RSE*, **23**, 195–228. (The variants in I. Grubrich-Simitis, *Back to Freud's Texts. Making Silent Documents Speak*, New Haven and London (1996), 172).]

(1937*d*) 'Konstruktionen in der Analyse', *Internat. Zschr. Psychoanal.*, **23**, 459–69. *GW*, **16**, 43–56.

[*Trans.*: 'Constructions in Analysis', *RSE*, **23**, 233–44.]

(1937*e*) 'Wenn Moses ein Ägypter war . . .', *Imago*, **23**, 387–419. [Included in (1939*a*).] *GW*, **16**, 114–55.

[*Trans.*: 'If Moses was an Egyptian . . .', included in (1939*a*), *RSE*, **23**, 18–49.]

(1937*f* [1902]) Letter to Theodor Herzl (September 28, 1902). [Partially reprinted] in L. Goldhammer, 'Theodor Herzl und Siegmund [sic] Freud', *Theodor Herzl Jahrbuch*, 266–8; the reprint p. 268. Complete letter in Y. H. Yerushalmi, *Freuds Moses. Endliches und unendliches Judentum*, Berlin (1992), 150.

[*Trans.*: Y. H. Yerushalmi, *Freud's Moses: Judaism Terminable and Interminable*, New Haven and London (1991), 107.]

(1937*g* [1936]) Telegram to delegates of the International Psychoanalytical Congress at Marienbad (August 2, 1936), *Internat. Zschr. Psychoanal.*, **23**, 186. Reprinted in B. Nitzschke, '". . . im Interesse unserer psychoanalytischen Sache in Deutschland"', *Chaos und Regel. Die Psychoanalyse in ihren Institutionen*, ed. J. Wiese, Göttingen (1992), 76–131; the telegram p. 121 *n*. 57.

(1937*h*) Der Thomas Mann-Fonds [Appeal], in *Das Neue Tage-Buch* (Paris and Amsterdam), **5** (6) [signed but not authored by Freud].

(1938*a*) 'Ein Wort zum Antisemitismus', *Die Zukunft* (Paris), No. 7 (November 25, 1938), 2. Simultaneously published in *Republikaner* (Mulhouse/Mühlhausen), **37**, No. 273 (November 25, 1938), 4. Facsimile in E. Freud, L. Freud & I. Grubrich-Simitis, eds., *Sigmund Freud. Sein Leben in Bildern und Texten*, Frankfurt (1976), 317. *GW*, **Nachtr.**, 779–81.

[*Trans.*: 'A Comment on Anti-Semitism', *RSE*, **23**, 257–8.]

(1938*b* [1937]) Letter to André Breton (December 8, 1937) [facsimile], *Trajectoire du rêve; Documents recueillis par André Breton* (*Cahiers G.L.M.* 7), Paris, 126–7.

(1938*c*) Letter to the Editor of *Time and Tide* (November 17, 1938) [in English with facsimile of the first page of the German original], in L. Rhondda, 'A Letter from Freud', *Time and Tide*, **19**, No. 48, November 26, 1938, p. 1649. [Version of November 16, 1938 included in (1960*a*).] Partial facsimile and German trans. in H. Meng, 'Freud und der Bildhauer', *Schweiz. Zschr. Psychol.*, **15** (1956), 149–51. *GW*, **Nachtr.**, 782–3.

['Anti-Semitism in England', *RSE*, **23**, 277.]

(1938*d*) [previously (1957*i* [1938])] Letter to Karl Weissmann (March 21, 1938). [Facsimile and Portuguese trans.] in *Estado de Minas*, April 26, 1938. Original German text in E. Jones, *Das Leben und Werk von Sigmund Freud*, **3**, Bern (1962), 537.

[*Trans.*: In E. Jones, *Sigmund Freud: Life and Work*, **3**, London (1957), 495.]

(1939*a* [1934–38]) *Der Mann Moses und die monotheistische Religion: Drei Abhandlungen*, Amsterdam. Includes (1937*b*) and (1937*e*). First draft, 'Der Mann Moses. Ein historischer Roman', under (1979*j*). [Parts of the third essay published under the title 'Der Fortschritt in der Geistigkeit' in *Internat. Zschr. Psychoanal. Imago*, **24** (1939), 6–9. Parts of drafts and plans for the contents published (with partial facsimiles) in I. Grubrich-Simitis, *Freuds Moses-Studie als Tagtraum. Ein biographischer Essay*, Weinheim (1991), 8–103; facsimiles pp. 92, 94, 97, 100.] *GW*, **16**, 103–246.

[*Trans.*: *Moses and Monotheism: Three Essays*, *RSE*, **23**, 9–124.]

(1939*b*) (With FREUD, A.) *Trans.* of M. Bonaparte, *Topsy, Chow-Chow au Poil d'Or*, Paris (1937), under the title *Topsy, der goldhaarige Chow*, Amsterdam (1939).

(1939*c*) [previously (1948*a*)] Introduction to P. Federn & H. Meng, eds., *Das Psychoanalytische Volksbuch* (3rd ed., Bern, 13 [as facsimile]).

(1939*d* [1910–35]) Six letters to Adolph J. Storfer (December 12, 1910, October 6, 1924, August 25, 1927, December 6, 1931, January 6, 1932, May 2, 1935) [fragments in facsimile], in J. L. McCartney, 'Zur Psychoanalyse der chinesischen Schrift', from the English trans. by A. J. Storfer, *Gelbe Post*, Ostasiatische Illustrierte (Shanghai), **1** (1939), Part 1, pp. 9–11; the facsimile montage p. 11.

(1939*e*) 'Vorbemerkung' [to the inaugural ed. of] *Internationalen Zeitschrift für Psychoanalyse und Imago* (London), *Internat. Zschr. Psychoanal. Imago*, **24**, 1.

(1939*f* [1929]) Letter to Isaac Landman (August 1, 1929). [Partial reprint; in English] in *Benefit Auction of Manuscripts, Letters and Books Under the Auspices of The League of American Writers* [etc.], February 19, 1939, p. 12, No. 28.

(1939*g* [1938]) Letter to the League of American Writers (November 11, 1938). [Partial reprint] in *Benefit Auction of Manuscripts, Letters and Books Under the Auspices of The League of American Writers* [etc.], February 19, 1939, p. 12, No. 29.

(1939*h* [1935]) [previously (1973*c* [1935])] Letter to Leib Jaffe (June 20, 1935). [Facsimile with Hebrew trans.] in *Haaretz*, September 29, 1939, p. 5.
[*Trans.*: In R. Klingsberg, ed., *Freudiana: From the Collections of the Jewish National and University Library, exhibited in The Berman Hall of the Library, March 28th – April 13th, 1973*, Jerusalem (1973), ix (20).]

(1939*i* [1923]) Letter of April 25, 1923. [In English; partially reprinted] in W. Kaempffert, 'Freudiana', *New York Times* (City Edition), **89**, No. 29863, October 29, 1939, Section 2, p. D7.

(1939*j* [1938]) Letter to Rachel Berdach (Bardi) (December 27, 1938). [Partially reprinted] in 'Freud und die Dichterin Bardi', *Aufbau/Reconstruction* (New York), **5**, No. 26, December 29, 1939. [Complete letter included in (1960*a*).]
[*Trans.*: Included in (1960*a*): *Letters 1873–1939*, New York (1960), London (1961).]

(1939*k*) Preface to Rachel Bardach [*sic*] Bardi, *Der Kaiser, die Weisen und der Tod*, in 'Freud und die Dichterin Bardi', *Aufbau/Reconstruction* (New York), **5** (1939), No. 26, December 29, 1939. [Bardi's book itself appeared on March 13, 1938, the day of the German invasion of Austria, so very few copies survive.]

(1939*l*) Congratulatory note (March 6, 1939) on the anniversary of the *Argentinischen Tageblatts*, in *Argentinisches Tageblatt*, **51**, No. 15594, April 29, 1939, Part 3, p. 1 (under the title 'Das Deutschland, das wir lieben, spricht'). Complete facsimile in U. Maumann, ed., *Ein Theatermann im Exil: P. Walter Jacob*, Hamburg (1985), 96.

(1939–40*a* [1938]) [previously (1940*g* [1938])] Introduction [in German with Hebrew trans.] to Y. Doryon, *Lynkeus' New State: A Plan for the Establishment of a New Social Order on an Improved and Humane Basis*, Jerusalem (1939), 6–7. [Included in (1945–46*a*).] Also in: *Freudiana, From the Collections of the Jewish National and University Library*, 1973, xv. *GW*, **Nachtr.**, 784; facsimile p. 785.
[*Trans.*: Preface to Yisrael Doryon's *Lynkeus' New State*, *RSE*, **22**, 277.]

(1940*a* [1938]) *Abriß der Psychoanalyse*, *Internat. Zschr. Psychoanal. Imago*, **25**, 7–67. [Included as part of (1940*b*) as a footnote, p. 21 f.] The English translation appeared simultaneously, with a supplementary Preface, under the title 'An Outline of Psycho-Analysis', *Internat. J. Psycho-Anal.*, **21**, 27–82. *GW*, **17**, 67–138 [without the Preface], **Nachtr.**, 749 [only the Preface].
[*Trans.*: *An Outline of Psychoanalysis*, *RSE*, **23**, 130–87 (complete).]

(1940*b* [1938]) 'Some Elementary Lessons in Psycho-Analysis' [title in English; text in German], *Internat. Zschr. Psychoanal. Imago*, **25**, 21–2. [Partially included as footnote in first edition of (1940*a*).] *GW*, **17**, 141–7.
[*Trans.*: 'Some Elementary Lessons in Psycho-Analysis', *RSE*, **23**, 263–8.]
(1940*c* [1922]) 'Das Medusenhaupt', *Internat. Zschr. Psychoanal. Imago*, **25**, 105–6. *GW*, **17**, 47–8.
[*Trans.*: 'Medusa's Head', *RSE*, **18**, 265–6.]
(1940*d* [1892]) (With BREUER, J.) 'Zur Theorie des hysterischen Anfalls', *Internat. Zschr. Psychoanal. Imago*, **25**, 107–10. *GW*, **17**, 9–13.

(1940*e* [1938]) 'Die Ichspaltung im Abwehrvorgang', *Internat. Zschr. Psychoanal. Imago*, **25**, 241–4. *GW*, **17**, 59–62.
[*Trans.*: 'Splitting of the Ego in the Process of Defence', *RSE*, **23**, 249–52.]
(1940*f* [1939]) Letter to Anna Freud Bernays (May 14, 1939) [in English trans.], in A. Freud Bernays, 'My Brother Sigmund Freud', *American Mercury*, **51**, November, pp. 335–42; the letter p. 342. Also in H. M. Ruitenbeek, ed., *Freud as We Knew Him*, Detroit (1973), 140–7; the letter p. 147. German reverse trans. in A. Freud Bernays, 'Mein Bruder Sigmund Freud (1940)', *Luzifer-Amor*, **2** (1989), Part 3, 139–45; the letter p. 145.
(1940*g* [1938]) Now under (1939–40*a* [1938]).
(1940*h* [1913, 1929]) Two letters to Theodor Reik (November 13, 1913, April 14, 1929) [partially reprinted, in English trans.], in T. Reik, *From Thirty Years with Freud*, New York and Toronto, 64, 173–5. [Includes (1930*f*). The extract from the letter of April 14, 1929, also included in the English edition of (1956*l*).]
(1941*a* [1892]) Letter to Josef Breuer (June 29, 1892), *GW*, **17**, 5–6.
[*Trans.*: Letter to Josef Breuer, *RSE*, **1**, 175–6.]
(1941*b* [1892]) Notiz 'III', *GW*, **17**, 17–18.
[*Trans.*: 'III', *RSE*, **1**, 177–8.]
(1941*c* [1899]) 'Eine erfüllte Traumahnung', *GW*, **17**, 21–3.
[*Trans.*: 'A Premonitory Dream Fulfilled', incorporated in (1900*a*), *RSE*, **5**, 562–4.]
(1941*d* [1921]) 'Psychoanalyse und Telepathie'. [Not to be confused with 'Zum Problem der Telepathie', the extract from Lecture XXX of the *Neue Folge* published in 1934; *see* (1933*a*).] Facsimile of the first page ('Vorbericht' of August 2, 1921) and deleted passages published in I. Grubrich-Simitis, *Zurück zu Freuds Texten. Stumme Dokumente sprechen machen*, Frankfurt (1993), 261, 265–6, 269–70, 274. *GW*, **17** (1941), 27–44 [excluding the deleted passages].
[*Trans.*: 'Psychoanalysis and Telepathy', *RSE*, **18**, 167–84 (complete).]
(1941*e* [1926]) Now under (1926*j*).
(1941*f* [1938]) 'Ergebnisse, Ideen, Probleme' (Notes). Excluded passages dated June 16, June 24, and September 22, 1938, published in I. Grubrich-Simitis, *Zurück zu Freuds Texten. Stumme Dokumente sprechen machen*, Frankfurt (1993), 125 *n.* 3, 125–6. *GW*, **17** (1941), 151–2.
[*Trans.*: 'Findings, Ideas, Problems', *RSE*, **23**, 274–6 (complete).]
(1941*g* [1936]) Sketch of a letter to Thomas Mann (November 29, 1936), *Internat. Zschr. Psychoanal. Imago*, **26**, 217–19 [incomplete]. [Included in (1960*a*), the letter as sent in (1988*g*).] Also in E. Jones, *Das Leben und Werk von Sigmund Freud*, **3**, Bern (1962), 533–5. *GW*, **Nachtr.**, 679–82.

[*Trans.*: In E. Jones, *Sigmund Freud: Life and Work*, **3**, London (1957), 492–3; also in (1960*a*): *Letters 1873–1939*, New York (1960), London (1961).]

(1941*h* [1939]) Letter to Charles Berg [in English; facsimile], in C. Berg, *War in the Mind: The Case Book of a Medical Psychologist. An Introduction to the Practical Application of Modern Psychology*, London, 6.

(1941*i* [1873]) 'Ein Jugendbrief' [to Emil Fluß] (June 16, 1873), *Internat. Zschr. Psychoanal. Imago*, **26**, 5–8. [Included in (1960*a*) and (1969*a*).]
[*Trans.*: Included in (1960*a*): *Letters 1873–1939*, New York (1960), London (1961).]

(1941*j* [1909]) Letter to Josef Breuer (October 8, 1909). [Partially reprinted] in 'Vorwort der Herausgeber' to S. Freud, *Gesammelte Werke*, **17** (1941). *GW*, **17**, vii.
[*Trans.*: In Editors' Note, *RSE*, **1**, 173.]

(1942*a* [1905–06]) 'Psychopathische Personen auf der Bühne', *Die neue Rundschau*, **73** (1962), Part 1, 53–7. Appeared first in English trans. under the title 'Psychopathic Characters on the Stage', *Psychoanal. Quart.*, **11** (1942), 459–64 [incomplete]. *GW*, **Nachtr.**, 656–61 [complete].
[*Trans.*: 'Psychopathic Characters on the Stage', *RSE*, **7**, 295–300 (complete).]

(1942*b* [1927, 1929, 1930]) Three letters to Arnold Zweig (December 2, 1927, February 20, 1929, August 21, 1930), in *Orient* (Haifa), **3**, No. 6 (May 8, 1942), 10–11. [Included in (1968*a*); letter of August 21, 1930, included in (1960*a*).]
[*Trans.*: *The Letters of Sigmund Freud and Arnold Zweig*, London and New York (1970).]

(1942*c* [1927]) Interview by Max Eastman: 'Visit in Vienna. The Crotchety Greatness of Sigmund Freud', in M. Eastman, *Heroes I Have Known. Twelve Who Lived Great Lives*, New York, 261–73. [Eastman dates the interview to 1926 but actually it took place on March 25, 1927 (cf. Freud to Eastman, March 23, 1927, Library of Congress, Freud Papers, Box 21, 23).]

(1944*a* [1935]) Letter to Theodor Reik (January 4, 1935). [Complete facsimile and partial reprint in Spanish trans.] in T. Reik, 'Sigmund Freud y Gustavo Mahler', *Revista de Psicoanálisis* (Buenos Aires), **1**, 315–20; the facsimile pp. 319–20, the partial reprint p. 318. [Included in (1956*l*).]

(1944*b* [1938, 1939]) [previously (1950*e* [1938, 1939])] Three letters to Hanns Sachs (July 11, 1938, August 21, 1938, March 12, 1939). [Partial reprint in English trans.] in H. Sachs, *Freud, Master and Friend*, Cambridge, MA (1944), 182–4, and London (1945), 180–2. German text in H. Sachs, *Freud, Meister und Freund*, London (1950), 167–9.

(1945*a* [1939]) 'Foreword' [in English trans.] to J. B. Hobman, *David Eder: Memoirs of a Modern Pioneer*, London (1945).
[Foreword to Hobman's *David Eder*, *RSE*, **23**, 278.]

(1945*b* [1926]) Letter to Montague David Eder (May 11, 1926) [in English], in J. B. Hobman, *David Eder, Memoirs of a Modern Pioneer*, London (1945), 20–1.

(1945*c* [1936]) Letter to Barbara Low (April 19, 1936) [in English], in J. B. Hobman, *David Eder, Memoirs of a Modern Pioneer*, London (1945), 21. [Included in (1960*a*).]
[*Trans.*: Included in (1960*a*): *Letters 1873–1939*, New York (1960), London (1961).]

(1945–46) Now under (1945–46*a* [1938]).

(1945–46*a* [1938]) [previously (1945–46)] Three letters to Yisrael Doryon (October 7, October 25, and November 28, 1938). [In Hebrew trans., the first two only partially reprinted] in Y. Doryon, *Der Mann Moses*, Jerusalem, 37–40; facsimiles pp. 42–5. [Includes (1939–40*a*).] *GW*, **Nachtr.**, 784 *n.*, 786–8; facsimile p. 785.

[*Trans.*: Extracts from Two Letters to Yisrael Doryon (extracts from the letters of October 7 and November 28; the third letter being published as 1939–40*a*), *RSE*, **22**, 278–9.]

(1946*a* [1938, 1939]) Two letters to David Abrahamsen (March 14, 1938, June 11, 1939). [In English trans., with facsimiles] in D. Abrahamsen, *The Mind and Death of a Genius*, New York (1946), 41, 42, 202, 207–9. German original and facsimiles in J. Le Rider, *Der Fall Otto Weininger*, Vienna and Munich (1985), 96–8.

(1947*a* [1931]) Letter to Paul Federn (November 1, 1931). [In English trans.] in P. Federn, 'Notes', *Psychoanal. Quart.*, **16**, 595–7; the letter pp. 595–6. [Included in (1971*h*) and (1997*h*).]

(1947*b* [1932]) [previously (1954*g* [1932])] Two letters to Viktor von Weizsäcker (October 16, and November 3, 1932), in V. von Weizsäcker, *Körpergeschehen und Neurose. Analytische Studie über somatische Symptombildungen*, Stuttgart, 5–7. Reprinted in V. von Weizsäcker, *Natur und Geist. Erinnerungen eines Arztes*, Göttingen (1954), 182–5.

(1948*a*) Now under (1939*c*).

(1948*b* [1939]) Letter to Hans Carossa (May 4, 1939), in *Hans Carossa. Eine Bibliographie zu seinem siebzigsten Geburtstag, 15.12.1948*, Murnau: Die Wage, 15. [Included in (1960*a*).]

[*Trans.*: Included in (1960*a*): *Letters 1873–1939*, New York (1960), London (1961).]

(1948*c* [1939]) Letter to Félicien Challaye (April 18, 1939) [in English]. [Partial reprint in French trans.] in F. Challaye, *Freud*, Paris (Les philosophes); the letter p. 34. Complete facsimile in *Cinq siècles sur papier. Autographes et manuscrits de la collection de Pedro Corrêa do Lago*, Paris (2004). German edition: *Schriftstücke. Autographen aus sieben Jahrhunderten. Aus der Sammlung von Pedro Corrêa do Lago*, Hildesheim (2005); the letter pp. 152, 153, 281.

(1950*a* [1887–1902]) *Aus den Anfängen der Psychoanalyse, Briefe an Wilhelm Fließ, Abhandlungen und Notizen aus den Jahren 1887–1902*, eds., M. Bonaparte, A. Freud & E. Kris, London. Reprinted with corrections, Frankfurt (1962). Unabridged letters reprinted under (1985*c*), but excluding the 'Entwurf einer Psychologie' of 1895. [The 'Entwurf' reprinted with corrections under (1950*c*). Seven of the letters included in (1960*a*).]

[*Trans.*: *The Origins of Psycho-Analysis: Letters to Wilhelm Fliess*, London and New York (1954, including the uncorrected 'Project for a Scientific Psychology'); Extracts from the Fliess Papers, *RSE*, **1**, 205–416 (extracts only).]

(1950*b* [1936]) Letter to Kurt Hiller (February 9, 1936). [Partially reprinted] in K. Hiller, *Köpfe und Tröpfe, Profile aus einem Vierteljahrhundert*, Hamburg and Stuttgart, 308. Reprinted in E. Jones, *Das Leben und Werk von Sigmund Freud*, **3**, Bern (1962), 192–3.

[*Trans.*: In E. Jones, *Sigmund Freud: Life and Work*, **3**, London (1957), 170.]

(1950*c* [1895]) Entwurf einer Psychologie [corrected reprint of (1950*a*) version], *GW*, **Nachtr.**, 387–477; two facsimiles pp. 418–19.

[*Trans.*: 'Project for a Scientific Psychology', *NSW*, **4**; *RSE*, **1**, 319–416.]

(1950*d* [1931]) Letter to Max Eitingon (June, 1931), in *Max Eitingon in memoriam*, Jerusalem, 47. Reprinted in E. Jones, *Das Leben und Werk von Sigmund Freud*, **3**, Bern (1962), 194. [Included in (2004*h*).]

[*Trans.*: In E. Jones, *Sigmund Freud: Life and Work*, **3**, London (1957), 171 (partial reprint with date June 30, 1931).]

(1950*e* [1938, 1939]) Now under (1944*b* [1938, 1939]).

(1950*f* [1878]) Letter to Wilhelm Knoepfmacher (August 6, 1878). [Partial reprint] in E. Kris, 'Einleitung' to *Aus den Anfängen der Psychoanalyse* [under (1950*a*)], p. 21 *n*. [corresponds to (1985*c*), p. 531 *n*. 20]. Also in E. Jones, *Das Leben und Werk von Sigmund Freud*, **1**, Bern (1960), 75–6. [The complete letter included in (1960*a*).]

[*Trans.*: In E. Jones, *Sigmund Freud: Life and Work*, **1**, London (1953), 58; also in (1960*a*): *Letters 1873–1939*, New York (1960), London (1961).]

(1950*g* [1928]) [previously (1986*a* [1928])] Letter to Viktor von Weizsäcker (June 23, 1928), in L. Weizsäcker, 'Die Handschrift Sigmund Freuds und das Problem der Graphologie', *Psyche*, **4**, 161–70; the letter p. 162 (incorrectly dated '20.6.1928'). Reprinted (with facsimile) in T. Henkelmann, *Viktor von Weizsäcker (1886–1957). Materialien zu Leben und Werk*, Berlin, Heidelberg, New York and Tokyo (1986, *Heidelberger Bibliotheksschriften*, **22**), 117–19; the letter p. 119, the facsimile pp. 117–18.

(1950*h* [1928]) Letter to Lucy Weizsäcker (July 17, 1928), in L. Weizsäcker, 'Die Handschrift Sigmund Freuds und das Problem der Graphologie', *Psyche*, **4**, 161–70; the letter p. 163.

(1950*i* [1928]) Letter to Oskar Pfister (January 18, 1928). [Facsimile] in A. Teillard-Mendelssohn, 'Die Handschrift Freuds', *Psyche*, **4**, 173–7; the facsimile after p. 176. [Included in (1963*a*).]

(1950*j* [1909–24]) Six letters to Oskar Pfister (February 9, 1909, August 16, 1909, March 6, 1910 [partial reprint], October 9, 1918, June 21, 1920 [incorrectly dated May 21, 1920], June 9, 1924), in 'Sigmund Freud – Oskar Pfister', *Schweiz. Zschr. Psychol.*, **15** (1956), 108–13. [Included in (1963*a*); letters of June 21, 1920, and June 9, 1924, also included in (1960*a*).]

[*Trans.*: Included in (1963*a*), *Psycho-Analysis and Faith: The Letters of Sigmund Freud and Oskar Pfister*, London and New York.]

(1951*a* [1935]) Letter to the mother of a homosexual (April 9, 1935). [In English, with facsimile] in 'A Letter on Homosexuality', *Amer. J. Psychiatr.*, **107**, 786–7; *Internat. J. Psycho-Anal.*, **32** (1951), 331; also in E. Jones, *Sigmund Freud: Life and Work*, **3**, London (1957), 208–9. [German trans. included in (1960*a*), and in E. Jones, *Das Leben und Werk von Sigmund Freud*, **3**, Bern (1962), 233–4.]

['A Letter on Homosexuality', *RSE*, **22**, 270–1.]

(1951*b* [1938–39]) Six letters to Jacob Meitlis [London Committee of Y.I.V.O.] (June 8, 1938, June 23, 1938, November 2, 1938, November 30, 1938, January 3, 1939, August 19, 1939) [in English], in J. Meitlis, 'The Last Days of Sigmund Freud', *Jewish Frontier*, September, **18**, S. 20–2. Four of the letters in German in J. J. Maitlis, 'Späte Begegnungen mit Sigmund Freud', *Neue Zürcher Zeitung*, December 12, 1964, p. 19. The letters of June 8, 1938, August 19, 1939, and [partly] November 30, 1938, also in E. Jones, *Sigmund Freud: Life and Work*, **3**, London (1957), 253–4 [in English], and E. Jones, *Das Leben und Werk von Sigmund Freud*, **3**, Bern (1962), 280–1 [in German trans.].

(1951*c* [1930, 1932]) Two letters to Richard Flatter (March 30, 1930, September 20, 1932). [In English trans.] in R. Flatter, 'Queries and Notes; Sigmund Freud on Shakespeare', *Shakespeare Quarterly*, **2**, 368–9. Also in E. Jones, *Sigmund Freud:*

Life and Work, **3**, London (1957), 461, 482, 485–6. Original German text in E. Jones, *Das Leben und Werk von Sigmund Freud*, **3**, Bern (1962), 498, 522–3, 526. [The letter of March 30, 1930, included in (1960*a*).]

(1951*d* [1934, 1936]) Two letters to Suzanne Cassirer Bernfeld (November 30, 1934, April 12, 1936). [Partially reprinted, in English trans.] in S. Cassirer Bernfeld, 'Freud and Archeology', *American Imago*, **8**, 107–28; the letters pp. 112, 122. Reprinted in *The Yearbook of Psychoanalysis*, **8** (1952), 9–55. German text in S. Bernfeld & S. Cassirer Bernfeld, *Bausteine der Freud-Biographik*, Frankfurt (1981, *Literatur der Psychoanalyse*), 237–59; the letters pp. 242, 254.

(1951*e* [1935]) Interview by Cornelius Tabori (July 21, 1935), in C. Tabori, *My Occult Diary*, London, 213–19.

(1952*a* [1938]) Two letters to Theodor Reik (July 3, and October 3, 1938) and a letter of recommendation (July 3, 1938). [In English trans.; the letter of recommendation English in the original] in 'Three Letters to America', *Psychoanalysis*, **1**, 5–6. [Included in (1956*l*).]

(1952*b* [1931]) Letter to Victor Bauer (October 18, 1931). [In French trans. with partial facsimile] in V. Bauer, 'Une lettre inédite de Sigmund Freud à son collaborateur Victor Bauer à propos de son article "Art et Culte des Morts"', *Journal de la maison Charles Veillon* (Lausanne), **9**, No. 7, 100–1; the letter p. 101.

(1953*a* [1882–86]) Letters to Martha Bernays. [Mainly partial reprints] in E. Jones, *Sigmund Freud: Life and Work*, **1**, London, *passim* [in English trans.]; original German texts in E. Jones, *Das Leben und Werk von Sigmund Freud*, **1**, Bern (1960), *passim*. The letter of September 25, 1882, also in G. Mattenklott, H. Schlaffer & H. Schlaffer, eds., *Deutsche Briefe 1750–1950*, Frankfurt (1988), 311–12. Another partial reprint of the letter of October 21, 1885, in R. W. Clark, *Freud: the Man and the Cause*, London (1980), 70 [English trans.]; German text in R. W. Clark, *Sigmund Freud*, Frankfurt (1981), 88 [this part of the letter is omitted in (1960*a*)]. [Some of the letters included in (1960*a*), other partial reprints in (1976*d*) and (1990*t*). Unabridged edition of all the letters under (2011*b*).]

(1953*b* [1886]) (With FREUD, M.) Letter to Emmeline Bernays (September 15, 1886). [Partial reprint] in E. Jones, *Sigmund Freud: Life and Work*, **1**, London, 165 [in English trans.]; German original in E. Jones, *Das Leben und Werk von Sigmund Freud*, **1**, Bern (1960), 183.

(1953*c* [1886]) Letter to Josef Breuer (September 1, 1886), in E. Jones, *Sigmund Freud: Life and Work*, **1**, London, 211–13 [in English trans.]; German original in E. Jones, *Das Leben und Werk von Sigmund Freud*, **1**, Bern (1960), 232–3. [Included in (1960*a*).]

(1953*d* [1885]) Letter to Jean-Martin Charcot [in French], in E. Jones, *Sigmund Freud: Life and Work*, **1**, London, 229 [in English trans.]; German trans. in E. Jones, *Das Leben und Werk von Sigmund Freud*, **1**, Bern (1960), S. 249 f.

(1953*e* [1912]) Two letters to Ernest Jones (April 28, and December 8, 1912) [the letter of April 28 in English]. Partially reprinted in E. Jones, *Sigmund Freud: Life and Work*, **1**, London, 222, 348; German text in E. Jones, *Das Leben und Werk von Sigmund Freud*, **1**, Bern (1960), 242, 370. [Unabridged edition of all the letters under (1993*e*).]

(1953*f* [1906]) Letter to Karl Kraus (January 12, 1906). [Partially reprinted] in E. Jones, *Sigmund Freud: Life and Work*, **1**, London, 347 [in English trans.]; German original in E. Jones, *Das Leben und Werk von Sigmund Freud*, **1**, Bern (1960), 369. [The complete letter included in (1960*a*) and (1973*e*).]

(1953*g* [1883, 1884, 1885]) Four letters to Minna Bernays (January 22, 1883, July 20, 1884, October 29, 1884, December 3, 1885). [Partially reprinted] in E. Jones, *Sigmund Freud: Life and Work*, **1**, London, 98, 130, 144, 201 [in English trans.]; German originals in E. Jones, *Das Leben und Werk von Sigmund Freud*, **1**, Bern (1960), 114, 147, 161, 221. [The complete letter of December 3, 1885, included in (1960*a*).]

(1954*a* [1933]) Two letters to Judah Leon Magnes (November 17, and December 5, 1933). [In English trans.] in M. Rosenbaum, 'Freud-Eitingon-Magnes Correspondence; Psychoanalysis at the Hebrew University', *J. Amer. Psychoanal. Ass.*, **2**, 311–16; the letters pp. 314–16. The German original of December 5 reprinted in H. E. Lück & W. Rechtien, 'Freud und Lewin. Historische Methode und "Hier-und-Jetzt"', in B. Nitschke, ed., *Freud und die akademische Psychologie*, Munich (1989), 137–59; the letter pp. 144–5. [The same letter included in (1960*a*).]

(1954*b* [1929]) Letter to Y.I.V.O. (December 29, 1929) [facsimile], *News of the Yivo*, **55**, 9. German original reprinted (as 'unpublished') in Y. H. Yerushalmi, *Freud's Moses: Judaism Terminable and Interminable*, New Haven and London (1991), 107. German edition: Y. H. Yerushalmi, *Freuds Moses. Endliches und unendliches Judentum*, Berlin (1992), 150.

(1954*c* [1934]) Letter to Henry Havelock Ellis (end September, 1934). [In English trans.] in J. Wortis, *Fragments of an Analysis with Freud*, New York, 13–14. German text (reverse trans.?) in J. Wortis, *Meine Analyse bei Freud*, Innsbruck and Vienna (1994), 14.

(1954*d* [1932–35]) Four letters to Joseph Wortis (May 21, 1932, September 29, 1934, July 14, 1935, October 20, 1935). [One in English; with facsimiles] in J. Wortis, *Fragments of an Analysis with Freud*, New York, 7, 15, 168–71.

(1954*e* [1938]) [previously (1924*i*)] Letter to Israel Cohen (June 14, 1938). [In English trans.] in Hamazkir [I. Cohen], 'A letter from Freud', *Jewish Observer and Middle East Review*, **3** (23), 10. The German original first published in the *Gesammelte Werke* (1987). *GW*, **Nachtr.**, 776.

[*Trans.*: Letter to Israel Cohen, *RSE*, **23**, 273.]

(1954*f* [1929]) Letter to Carl Häberlin (September 4, 1929). [Partially reprinted] in *J. A. Stargardt* (Marburg), Catalogue 513, No. 359.

(1954*g* [1932]) Now under (1947*b* [1932]).

(1954–55*a* [1919]) Two postcards to Felix Boehm (October 5 and 6, 1919). [Facsimiles] in F. Boehm, 'Beitrag zu Freuds Arbeitsweise', *Zschr. Psychosomat. Med.*, **1** (1954/55), 148–9; the postcards p. 149. Reprinted in F. Boehm, 'Meine Begegnungen mit Freud', *Der Psychologe*, **8** (1956), special issue 5–6, pp. 176–81; the postcards pp. 178–9.

(1955*a* [1907–08]) Originalnotizen zu einem Fall von Zwangsneurose [(1909*d*)]. Substantial portions of the notes first published in English trans. (1955) in the *Standard Edition*. The original German text first appeared together with a French trans. in E. R. Hawelka, ed., *L'Homme aux rats; Journal d'une analyse*, Paris (1974, *Bibliothèque de Psychanalyse*), 30–248. *GW*, **Nachtr.**, 505–69 [in a new transcription]; facsimile p. 537.

[*Trans.*: Original Record of the Case, *RSE*, **10**, 195–239 (the new transcription).]

(1955*b* [1906–31]) Ten letters to Arthur Schnitzler (May 8, 1906, May 14, 1912, May 14, 1922, June 8, 1922, October, 1924, March 8, 1926, March 24, 1926, May 24, 1926, May 7, 1928, May, 1931), in H. Schnitzler, ed., 'Sigmund Freud. Briefe an Arthur

Schnitzler', *Die neue Rundschau*, **66**, 95–106. Partial facsimile of the letter of May 14, 1912, also in *Die Brücke* (Hoechst), No. 27, February 1967; also in *J. A. Stargardt*, Catalogue 680, p. 179, No. 395.

(1955*c* [1920]) 'Gutachten über die elektrische Behandlung der Kriegsneurotiker'. The text appeared first in English trans. in the *Standard Edition* (1955). *GW*, **Nachtr.**, 706–10.

[*Trans.*: 'Memorandum on the Electrical Treatment of War Neurotics', *RSE*, **17**, 207–10.]

(1955*d* [1876]) Grant application (February 22, 1876) and two accompanying letters (June 8, and July 4, 1876) concerning zoological research, in J. Gicklhorn, 'Wissenschaftsgeschichtliche Notizen zu den Studien von S[imon] Syrski (1874) und S. Freud (1877) über männliche Flußaale', *Sitzungsber. Akad. Wiss. Wien* (Math.-Naturwiss. Kl.), I, **164**, 1–24; the application p. 19, the letters p. 21.

[*Trans.*: Two Applications for Grants for Biological Research, *NSW*, **1**.]

(1955*e* [1930]) Letter to Juliette Boutonier (April 11, 1930). [In German with French trans.] in J. Favez-Boutonier, 'Psychanalyse et philosophie', *Bull. soc. franç. philos.*, **49**, 3–4. *GW*, **Nachtr.**, 671–2.

[*Trans.*: Letter to Juliette Boutonier, *RSE*, **21**, 240–1 (incorporates (1933*f*).]

(1955*f* [1909–38]) Now under (1956*m* [1909–38]).

(1955*g* [1907]) Circular letter [to the members of the Psychologischen Mittwoch-Gesellschaft] (September 22, 1907), in E. Jones, *Sigmund Freud: Life and Work*, **2**, London, 10–11 [in English trans.]. Original German text in E. Jones, *Das Leben und Werk von Sigmund Freud*, **2**, Bern (1962), 22–3. [Included in (1962–75*a*), **1**, German edition (1976), 189–90.]

(1955*h* [1908–28]) Letters to Sándor Ferenczi. [Mainly partial reprints] in E. Jones, *Sigmund Freud: Life and Work*, **2**, London, *passim* [in English trans.]. Original German texts in E. Jones, *Das Leben und Werk von Sigmund Freud*, **2**, Bern (1962), *passim*. [The complete letter of September 30, 1918, included in (1960*a*); that of January 4, 1928, in (1980*a*); partial reprints of the letters of April 3, and October 6, 1910, included in (1972*e*); unabridged edition of all the letters under (1992*g*).]

(1955*i* [1917]) Letter to Gisela Pálos (April 30, 1917). [Partial reprint] in E. Jones, *Sigmund Freud: Life and Work*, **2**, London, 218 [in English trans.]. Original German text in E. Jones, *Das Leben und Werk von Sigmund Freud*, **2**, Bern (1962), 233. [Complete letter included in (1992*g*) and (1992*t*).]
